Table 2 presents the respondents perception on actual practices incongruent to the norms of conduct and ethical standards that may be prevalent in the public service in the selected cities and municipalities of Nueva Ecija. When asked about the actual practices incongruent to the norms of conduct and ethical standards, the respondent revealed that some of the unethical practices are committed as signified by a *moderately agree response*. A *moderately agree* appraisal on dishonesty was given by department heads of cities, government personnel, and constituents of both cities and municipalities, while department heads of municipalities *disagreed* on this item. The department heads of cities and municipalities "disagreed" on the existence of unauthorized solicitation of contribution, lending of money for usurious interest, and engaging in partisan politics, while a difference on perception is observable on the description of the department heads of cities and municipalities along the factors of practical professionalism on dishonesty, neglect of duty, misconduct, and discourtesy. The heads of the cities on the other hand, *moderately agree* on the existence of these negative behaviors different from the heads of municipality who *disagree* on the matter. The observation of constituents of both municipalities and cities is comparable and almost similar to the appraisal on the existence of practices incongruent to norms of conduct and ethical standards in public service made by personnel of cities and municipalities including the degree of occurrence; their responses are different in most respect to the responses of department heads of municipalities (*disagree*) but are similar in the appraisal of department heads of cities in terms of *moderately agree* response on dishonesty, neglect of duty, misconduct, discourtesy, engaging in partisan politics, and receiving of gifts for personal use. On the other hand, personnel of both cities and municipalities and constituents have almost the same responses in almost all matters (*moderately agree*) pertaining to actual practices incongruent to the Code of Conduct and Ethical Standards in Public Service. A *significant difference* appeared only in the appraisal of LGU constituents. The data showed that the appraisal of all respondents in terms of the comparison across municipalities was comparable. Finally, when compared across cities and municipalities, the results showed that the appraisal of respondents was *significantly comparable*.

## Conclusion

Overall, the self-assessment made by heads and personnel of cities and municipalities gave a quite modest appraisal indicating *not the highest nor the lowest positive* on their adherence to the norms of conduct and ethical standards a little lower in appraisal given by their constituents; while the

**Professionalism and the Ethics in Selected Local Governments in the Philippines, Table 2** Actual practices incongruent to the norms of conduct and ethical standards that may be prevalent in the public service in the selected cities and municipalities of Nueva Ecija

| Norms of conduct | Department heads of cities | Department heads of municipalities | Personnel of cities | Personnel of municipalities | Constituents of cities | Constituents of municipality |
|---|---|---|---|---|---|---|
| (a) Dishonesty | Moderately agree | Disagree | Agree | Moderately agree | Moderately agree | Moderately agree |
| (b) Neglect of duty | Moderately agree | Disagree | Moderately agree | Moderately agree | Moderately agree | Moderately agree |
| (c) Misconduct | Moderately agree | Disagree | Moderately agree | Moderately agree | Moderately agree | Moderately agree |
| (d) Discourtesy | Moderately agree | Disagree | Moderately agree | Disagree | Moderately agree | Moderately agree |
| (e) Receiving gift for personal use | Moderately agree | Disagree | Moderately agree | Disagree | Moderately agree | agree |
| (f) Unauthorized solicitation of contribution | Disagree | Disagree | Moderately agree | Moderately agree | Moderately agree | Moderately agree |
| (g) Lending of money for usurious interest | Disagree | Disagree | Moderately agree | Disagree | Moderately agree | Moderately agree |
| (h) Engaging in partisan politics | Moderately agree | Disagree | Moderately agree | Disagree | Moderately agree | Moderately agree |

overall appraisal of the three sets of respondents from the selected offices in cities and municipalities of Nueva Ecija revealed a uniform *agree* response in all of the parameters of professionalism and ethics used in this chapter. Nevertheless, the LGU constituents indicated their highest appraisal on the adherence of only to the *agree* scale contrary to the appraisal made by department heads where a consistent *strongly agree* appraisal was given. The government personnel from municipalities would always indicate higher appraisal than the city government personnel. All in all, there is a varying appraisal of the three groups on adherence to the norms of conduct in public service.

Meanwhile, the existence of practices considered incongruent to the norms of conduct and ethical standards in public service is rated by the department heads, personnel, and constituents as *moderately agree* showing a less firm resolve of practicing what has been required of public service ethics. What is alarming is the constituents' perception that practices incongruent to public ethics are taking place as supported by their unwavering *moderately* affirmative appraisal. This finding suggests the unity of perception of the three groups of respondents on the existence of unethical behavior in public office and the need to improve bureaucratic practices align to their claim that they observe code of conduct in public office.

## Future Directions

The findings of the study show a gap between the appraisal of the constituents, personnel, and heads of departments in cities and municipalities in the observance of code of conduct and ethical standards and actual adherence translated into practice in their respective offices. Although the appraisal is quite acceptable being "modest," there is still the need to improve professionalism and ethics in the system of bureaucracy in the LGU. And this may be done through formulation of reinforcing policies that may cause both department heads and personnel to seek for improvement in the discharge of their functions, duties, and responsibilities based on legal and moral standards.

There is also a clear showing of the incongruence of knowledge on ethical standards and actual practices of personnel and department heads of conduct incongruent to the standard of RA 6713. All in all the observance of ethics and professionalism is known to the respondents. But as a matter of practice, higher level of adherence is necessary to reflect awareness on actual practice. Thus, the Department of the Interior and Local Government may conduct morality enhancement program to set the common criteria for professional practice both in theory and in practice. The gap between the appraisal of department heads of municipal and city offices and constituents may be narrowed down through the use of digital technology for communication between LGU offices and the constituents. Further studies may be conducted to determine other actual practices prevailing in the local government offices for enhancement of positive behavior and rewards for outstanding services provided.

## Introduction: What Is Program Evaluation and Why Do It?

The purpose of program evaluation is to improve the effectiveness and efficiency of public policies and programs through systematic research. In the private sector, the success of any given product or service might be determined by its marketability, with profit the ultimate arbiter. Public sector initiatives present particular challenges where assessment is concerned, as they often target pernicious social problems, like poverty. The causes of such problems are multifaceted and contested, as are the programs designed to address them, and both are subject to the vagaries of politics. Despite the difficulties involved in tackling such wicked problems (Rittel and Webber 1973), public employees at all levels have found themselves increasingly accountable for providing evidence that their efforts help to achieve desired outcomes within budgetary constraints. Evaluation can influence policy and program development and implementation by establishing the need for a program, selecting a preferred course of action, and adapting that course of action in accordance with findings of program effectiveness, or lack thereof (Henry 2003).

New York's Mayor Ed Koch often greeted citizens with his catchphrase "How'm I doin'?" This, in the most colloquial of terms, is the very question that program evaluation seeks to answer. Through formal means of evidence-based inquiry, evaluation offers answers to the question of how well government is doing. The end of Koch's time in office in 1989 coincided with the beginning of a new era of increasing emphasis on government results and accountability. Some significant milestones in the evolution of program evaluation occurred in the early 1990s, including the creation of the National Performance Review (NPR) by President Clinton in March of 1993 and the passage of the Government Performance and Results Act (GPRA) by Congress that same year. These initiatives addressed the perceived ineffectiveness and inefficiency of government by calling for clear definition of program goals, attention to program performance, and an emphasis on results. They included the explicit requirement to use

program evaluation in "establishing or revising general goals and objectives" and to tie program activities to budget plans (Government Performance and Results Act 1993, Section 3, a, 6).

The influential book *Reinventing Government; How the Entrepreneurial Spirit Is Transforming the Public Sector* (Osborne and Gaebler 1992) captured the zeitgeist and served as a "blueprint" – so-called by President Bill Clinton – for reform. Coauthor David Osborne was tapped by Vice President Al Gore to direct the efforts of the National Performance Review, echoing its themes of adopting market mechanisms and incentives to inspire government improvements and enhance its ability to satisfy citizens, now re-characterized as customers. A case study published by Harvard's Kennedy School of Government illustrated the plight of such citizen customers by chronicling the experience of a routine, dreaded visit to the registry of motor vehicles (Scott and Leone 1984). The inefficiencies and indignities of the customer experience, and frustrating interactions with state employees, make it easy to imagine how citizens might become disaffected. While the pedestrian goal of reform was aimed more at the level of balance sheets, its loftier purpose was to "improve the confidence of the American people in the capability of the . . . Government by systematically holding . . . agencies accountable for program results" (Government Performance and Results Act 1993, Section 2, b, 1). Thus, program evaluation can be seen not only as a mechanism for assuring effective and efficient program operations but, more broadly, for supporting the foundations of democracy by bolstering government accountability and strengthening citizen trust in government.

## How Programs Are Evaluated

Most who call for the evaluation of programs are concerned primarily with two things: whether or not a program "worked" (its outcome or impact) and how efficient it was. Yet by the beginning of the twenty-first century, some evaluation scholars and practitioners were calling for a more holistic view of evaluation. Rossi et al. (2004) suggested the evaluation hierarchy framework, identifying five "groupings of evaluation questions and methods" that "constitute the building blocks of evaluation research, and individually or in combination, are recognizable in virtually all evaluation studies" (80). Each building block necessarily rests on the firm foundation of the step beneath, beginning with an assessment of the need for the program (step 1), followed by assessments of the program theory (step 2) and implementation (step 3). Only once these prior steps have been considered might a meaningful assessment of a program's outcome or impact (step 4) be conducted. Finally, an assessment of the program's cost and efficiency (step 5) has the best chance of yielding meaningful results when the previous steps are well established. There is not much sense in determining whether a program has been efficient if it has not yet been determined to be effective. Likewise, evaluating a program's outcomes without consideration of how it has been implemented can lead to what some have termed "black box evaluation," which gives an indication of what programs "work" and "don't work" but offers "no understanding of why they succeed or fail" (Heckman and Smith 1995).

The Program Assessment Rating Tool (PART) implemented by the George W. Bush Administration in 2002 evaluated over 1,000 federal government programs by administering questionnaires divided into four sections. The first took into account "whether a program has a clear purpose and is appropriately designed to achieve its objectives," the second evaluated strategic planning, the third rated program management, and the fourth assessed program results (Breul 2007, p. 24). The inclusion of these four categories reflects the idea embodied in the evaluation hierarchy that not just outcomes and efficiency are important in determining the merit of a given program. Nonetheless, the PART did "render a judgment" as to whether each program was effective after subjecting it to systematic review, and its findings were meant to inform budgeting decisions (Breul 2007, p. 24). It labeled programs either "Effective," "Moderately effective," "Adequate," or "Ineffective"; and if insufficient

evidence was available, a program could be classified under the moniker "Results not demonstrated." PART was subject to accusations of politicization by some, but received praise from the Council for Excellence in Government and Harvard's Kennedy School of Government, whose Ash Institute gave it the 2005 Innovations in American Government Award (Breul 2007, p. 25).

Program evaluations take many different forms, and scholars differ in the theoretical frameworks that they advocate, but there is some consensus among scholars and practitioners alike that evaluation methods and recommendations should be "practical and feasible and conducted within the confines of resources, time, and political context" (Centers for Disease Control and Prevention 2012, Introduction, para. 2). This being the case, most programs will likely never undergo an evaluation that covers all of the building blocks in the evaluation hierarchy. Still, taking a look at those steps here serves as a basis for examining essential aspects of all evaluation.

## Program Need and Stakeholders

Determining the identified need for any given program is a good first step toward evaluating its outcomes. Since public policies and programs can be construed as solutions to identified public problems, it is worth asking just what problem each policy or program is intended to solve. This may seem too obvious a question to ask, yet for programs that have long been in existence, the answer may have never been clearly articulated at the outset, or the problem may have evolved, thus warranting reexamination. A further consideration is that varying stakeholders may disagree about the nature of the problem being addressed and will thus favor different program objectives, making an assessment of outcomes especially difficult.

Naturally, a determination of program need is best done upon a program's inception in a forward-looking manner and is akin to the very first step recommended for policy analysis: problem definition (Bardach 2012). Defining a problem involves describing it and quantifying it so it is clear who is affected, where, and in what ways. "Overwhelming piles of undeniable specifics" attesting to the existence of a problem serve to demonstrate the need for an intervention and can aid consensus for action (Keck and Sikkink 1998, p. 45.) Creators of new programs are now encouraged to consider this step in detail up front, clearly defining the condition to be ameliorated, such as teen pregnancy or illiteracy. Identifying some metrics beforehand that can be assessed after the program has been in operation for a period of time makes it easier to see if the program has made a difference. Evaluators of existing programs must look for explicit evidence of perceived need in foundational program documents or guidelines or implicit evidence gleaned from program operations.

Specificity is required in identifying the target population – those whose behaviors or conditions the program is intended to influence to achieve policy goals. This includes the geographic area in which the target population is found (called the "catchment area" in evaluation parlance) and any other characteristics, such as age or weight, or education level, which might be relevant to program goals. Another population that must be taken into consideration is program stakeholders. These comprise anyone who has a stake in the conduct or goals of the program, either as members of the target population, those who must carry it out, or anyone who stands to benefit or be burdened in some way by its existence. Identifying stakeholders and soliciting their input will give evaluators the best possible sense of the program need and goals and enhance the possibility of the evaluation being useful. The idea of "utilization-focused evaluation" is that its findings should be "used to support making decisions about what works and doesn't work" (Patton 2012, p. 2); rather than sitting "moribund on a shelf somewhere," findings should be strategically disseminated to stakeholders (Chelimsky 2008, p. 413). Despite the apparent wisdom of this aspiration, and increasing statutory emphasis on its importance, there is evidence that evaluation results are often unused; in fact, the General Accountability Office found that federal "agencies' reported use of performance information... generally did not improve between 2007 and 2013" (2014).

## Program Theory and Logic Models

"A program can . . . be thought of as a hypothesis: if a program is implemented as planned, then certain results are expected to follow" (McLaughlin and Jordan 2010, p. 56). This expectation rests on some important assumptions: that the causes of the problem are well understood and properly identified and that the program as designed has the capacity to bring about desired change. Logic models can be used to explore these assumptions and the theories upon which they are based. They can make the underlying rationale of a program explicit to all stakeholders by clearly identifying "antecedent conditions" of the problem (Renger and Titcomb 2002), the desired outcomes of the program, and the resources and activities that will be used to achieve its stated goals.

To identify the causes of the problem addressed by the program being evaluated, Renger and Titcomb advocate asking a series of "why" questions to uncover various causal pathways to the targeted condition (496). Where the problem of obesity is concerned, for instance, the first question asked might be why people are overweight or obese to begin with. One answer to that root question is that people consume too many calories; another is that they are sedentary. A follow-on question to the first answer – that they consume too many calories – would ask *why* people consume too many calories, leading to a couple of answers, including that they more frequently eat in restaurants these days (which serve large portion sizes) or that they are consuming increasingly larger quantities of sugar-sweetened beverages (SSBs). A third series of "why" questions would probe the reasons for these latter two circumstances, and so on, until a broad array of factors are identified. For the model, each condition (obesity, overconsumption, frequent restaurant meals, large quantities of SSBs) would be depicted in a box with arrows showing the sequence of relationships among them. This admittedly simplistic exercise enables the identification of "all the major factors that 'cause' the problem" (McLaughlin and Jordan 2010, p. 64). Once these factors are identified as exhaustively as possible, those targeted by the program under evaluation can be specified. No one program could hope to tackle them all.

After using this type of "backward mapping" to answer "How did we get here?" – to the condition where a policy or program is needed to solve a public problem (McLaughlin and Jordan 2010, p. 68) – a logic model can be drawn that is focused on how and why the program is expected to work, by laying out the program theory. While logic models vary in their use of particular elements, there is broad agreement that they ought to include the following in some form: inputs, activities, outputs, and outcomes (divided into categories of short, medium, and long term). A good first step in creating such a model is to start with the long-term outcome of interest and work backward in filling in the rest of the model. The long-term goal of any program might be characterized as its broadest, perhaps even loftiest, objective. So, for a program aimed at reducing consumption of SSBs, the long-term goal might be expressed as being, "To reduce the condition of obesity in the target population in order to enhance health and well-being, and reduce costs associated with being obese." An intermediate goal of such a program might be to change a behavior that leads to the problematic condition, such as consuming SSBs. And short-term goals could be aimed at creating the conditions that could lead to behavior change, such as educating people about the calorie content of SSBs and the health implications of consuming them or making SSBs more expensive through taxation to reduce sales. As this progression suggests, programs can be seen as being "based on a series of . . . theories about what is important to do if the participants are to achieve success" (Birckmayer and Weiss 2000, p. 408).

The outcome section of any logic model should be collectively focused on changes to be brought about in the target population in order to mitigate the identified problem in the short, intermediate, and long term, while the input, activity, and output section is focused on the workings of the program itself. Inputs are the resources, including human and financial, that are needed to support the program; activities are the things that the program does to reach the target population through the

provision of goods or services, or any other actions it might take to bring about desired change; and outputs are countable things that a program produces (McLaughlin and Jordan 2010). These first steps in the logic model are useful for program managers in planning how to bring about the desired outcomes and are important considerations for program implementation.

## Program Implementation and the Purpose of Evaluation

Scholars have identified the primary purposes of evaluation including (1) program improvement, (2) accountability, (3) knowledge generation, and (4) hidden agendas (Rossi et al. 2004). Evaluation aimed at program improvement is known as formative evaluation, and it necessarily focuses on program implementation, or the processes by which the program is carried out. Summative evaluation, on the other hand, is concerned with a big picture answer regarding program effectiveness and is not concerned with the program inputs and activities that are undertaken to achieve program ends. For accountability purposes, a summary judgment of whether a program is effective or ineffective is what stakeholders seem to desire most. While the relative merits of formative versus summative evaluation have long been debated, there has been increasing acknowledgment of evaluation's more general utility beyond this limited, dualistic paradigm (Patton 1996). These remaining purposes of evaluation reflect what might be characterized as both lofty and base aspirations. Methodologically well-done evaluation can add to the body of knowledge in relevant fields and improve practice beyond the confines of any individual program. Conversely, politically motivated evaluation can be steered by hidden agendas to advance or subvert particular programs for self-serving reasons more than by methodological purity or public interest.

For whatever purpose a program is being conducted, its findings will likely be more credible and valid if it takes program process, otherwise known as implementation, into account. A program may be put in place to address an identified need and be based on sound theory as to why it is expected to work, but if it is not well implemented, its chances of achieving desired ends are diminished, or scuttled altogether. A study of welfare reform in the state of California in the 1990s is often cited to illustrate this point (Meyers et al. 1998). Public sentiment in the United States during this period had coalesced around a widely agreed upon need for reform. In order to address perceived inefficiencies in the existing welfare system, new program theory was postulated, which operated on the belief that the indefinite provision of government support to the target population would lead to ongoing dependency, inefficiencies, and fraud. The "Work Pays" program was designed to fundamentally change the nature of welfare in California, most prominently provided by what was then known as the federal Aid to Families with Dependent Children (AFDC) program. "Work Pays" was meant "to materially influence the work behavior of AFDC recipients by establishing incentives to work and disincentives to remain on AFDC" (Meyers et al. 1998, p. 5). Yet study of the program's implementation found that frontline workers rarely conveyed information about the changed policy to program clients. Though embraced by state lawmakers and at high levels in the California Department of Social Services, the program had never been fully implemented by "street level bureaucrats." Therefore, it could not have been expected to bring about desired behavioral changes in the target population, and may in fact have caused some harm, by failing to inform clients about reduced benefits and mechanisms for accessing work opportunities.

Program process monitoring can help to avert such undesirable outcomes. Since the 1990s it has been advocated as "a key component of informed public management… for improved public sector performance" (Wholey and Hatry 1992). Identifying and regularly measuring essential activities and conditions can identify shortcomings before they might cumulatively contribute to a program's failure or significantly diminished performance. Process monitoring itself also serves as a mechanism of public accountability. The Recovery Accountability and Transparency Board (Recovery Board), for instance, was established by Congress to oversee funds

appropriated by the American Recovery and Reinvestment Act of 2009, and its website, Recovery.gov, gave weekly, publicly available updates about how those funds were being obligated and expended. The General Accountability Office (GAO) determined that Recovery Board oversight, by ongoing monitoring of performance using data analytics, did in fact help in identifying instances of fraud in the course of program operations (GAO 2015).

### Program Outcomes and Evidence of Effectiveness

"An outcome is the state of the target population or social conditions that the program is expected to have changed" (Rossi et al. 2004, p. 204). According to Rossi, Lipsey, and Freeman, a program cannot claim success without some measure of beneficial change in a given social area. Even though the measures of such outcomes can seem pretty straightforward, identifying and getting access to relevant data can be difficult. If a program seeks to reduce consumption of sugar-sweetened beverages (SSBs) for the purposes reducing the incidence of obesity in children in a public school system, evaluators will have to either identify existing indicators to measure program process and outcomes, or go about collecting and measuring the necessary data. The long-term outcome of reducing obesity might be measured by the body mass index (BMI) of students, but this data may not be publically available, or available for the specific population of interest. A measure of the intermediate outcome of reduced consumption of SSBs among students might be gleaned from soda sales in school vending machines, or surveys of students reporting on their consumption, but each of these measures presents its own challenges. Vending machine sales cannot capture all consumption, and self-reports on surveys may suffer from mistakes in reporting due to deliberate misrepresentation or faulty memory. These are just a couple of examples of the difficulties and inaccuracies to be expected when attempting to make determinations of program outcomes. Still, while they may not give us exact numbers, such measures can provide an indication of the magnitude and trend of the problem in target populations and thus be useful in planning to mitigate it by conveying a general idea of the size and shape of the problem.

Requiring programs to have measurable indicators is essential, but not without pitfalls and at times may even distort program activity. The most resonant example of this may be "teaching to the test," a problem much bemoaned in the wake of the No Child Left Behind Act of 2001, which many feel led to an overemphasis on standardized testing in US schools, even while it sought to eradicate educational disparities. Similarly, an initiative by the Illinois Department of Public Aid to more fairly reimburse nursing homes for Medicaid patients according to the level of care received (meaning that it paid more for especially ill patients) actually seemed to increase the number of bedridden residents (Osborne and Gaebler 1992).

Nonetheless, the persisting influence of the reinventing government movement's emphasis on the importance of focusing on outcomes (Jossi 2004) is evident in publications such as Ezekiel Emmanuel's 2014 book *Reinventing American Healthcare* in which he identifies, for each area of the Affordable Care Act, "specific measures" and "quantitative metrics" that might ultimately be used to assess the Act's success or failure. More consequentially, the Government Performance and Results Modernization Act of 2010 renewed and deepened the commitment of the original GPRA of 1993 by requiring each agency to have publicly available mission statements "including outcome-oriented goals, for the major functions and operations of the agency" (2010, Section 2, a, 2).

The purpose of focusing on outcomes is to ensure that programs are achieving meaningful improvements in situations where public problems persist and that those results can be demonstrated with credible evidence. Evaluators are urged to use the soundest methodologies available in reaching conclusions regarding program effectiveness. Such evidence will be but one factor in decision-making regarding programs due to political and ideological differences among stakeholders. At times, even strong evaluation results are stubbornly disbelieved. This was the case with

the Drug Abuse Resistance Education (D.A.R.E.) program, which communities largely continued to support even though evaluations found that it "is not effective in preventing adolescent drug use" (Birkeland et al. 2005, p. 248).

Experimental design is considered to be the "gold standard" in assessing program effectiveness. It requires randomly assigning program-eligible targets to one of two groups: the intervention group, which participates in the program of interest, and the control group, which does not. In the case of D.A.R.E., this would involve identifying all students eligible to receive D.A.R.E. training in a given location and then dividing them into an intervention group that receives the training and a control group that does not. Random assignment is meant to ensure that each group has people with the same mix of characteristics, so that when the effect of the intervention is measured, the only difference of consequence will be their program participation. So, if students who attended D.A.R.E. training were in fact less likely to use drugs later in their teen years, that beneficial change could be attributed to the program.

Often it is not possible to conduct such experiments, also known as randomized controlled trials (RCTs), due to the expenses involved and ethical considerations about withholding program services from eligible would-be recipients. It is often more practical and feasible to evaluate program effect by using quasi-experimental assessment "in which control groups are constructed by nonrandom means" (Rossi et al. 2004, p. 266). These techniques include making up a group of controls by matching selected characteristics of the program group, measuring the same program targets before and after an intervention (known as a simple "pre-post design"), and using statistical controls, among others (Rossi et al. 2004). Without random assignment, though, quasi-experiments run the risk of introducing bias into the estimation of program effects, leading to programs potentially taking either credit or blame for outcomes due not to program participation, but to some preexisting characteristic of the comparison groups.

The more "scientific" a study is, the more credible and useful it will be. Newcomer et al. (2010) have developed a "pyramid of strength" for designing evaluations capable of producing credible findings. The base is built on valid and reliable measures, followed by internal and external validity for the sake of generalizability of findings, and statistical conclusion validity, which requires an adequate sample size (12). The stronger the evidence, the better chance of convincing any program's inevitable detractors of its worth, assuming that its findings offer evidence of beneficial program effect.

## Efficiency

All organizations, whether public or private, must be concerned with the question of efficiency, as budgets almost always have limits, and programs are accountable to stakeholders, whether they are taxpayers, lawmakers, managers, stockholders, or philanthropists. At a minimum, programs should strive to substantiate whether their costs justify any purported benefits. The two primary types of evaluation available for this purpose are cost-benefit analysis (CBA) and cost-effectiveness analysis. Both require that program costs to be monetized, which is not too difficult a requirement, as programs must have some accounting of the costs they incur. It is accounting for benefits that can be trickier, as some program benefits are considered to be a bit intangible, such as the value of a human life saved or the value of a beautiful view made possible by the cleanup required in an environmental statute. Despite the discomfort of some in placing a dollar value on such benefits, it is routinely done by the likes of insurance companies and the Environmental Protection Agency, which is in many cases required by law to conduct CBA. Cost-effectiveness analysis can be more comfortable for decision-makers regarding social programs, as benefits are expressed in terms of substantive benefit achieved per dollar expended. A smoking cessation program, for example, might express the benefit in terms of the number of smokers who quit for every program dollar expended. Though efficiency, however measured and expressed, is the final step in Rossi, Lipsey,

and Freeman's evaluation hierarchy, it is likely to be foremost in the minds of most decision-makers.

### A Note on Measurement

The New Public Management model that arose in the late twentieth century favors the use of performance measures to evaluate how well programs have achieved their goals (Pfiffner 2004, p. 8). The focus on meaningful outcomes versus mere inputs and outputs is intended to increase public sector efficiency and accountability. Critics of this approach note how difficult it can be to put into practice, since public goods are fundamentally different from goods produced in the private sector. One detractor has even remarked that "There is an inverse relationship between the importance of an indicator and the ease, or even possibility, of its quantification" (Perrin 1998, p. 372). This frustration arises from the fact that indicators for conditions such as juvenile delinquency, for example, which some public programs aim to reduce, can be numerous and disparate, including proxy or indirect measures ranging from self-esteem to school grades to involvement with the justice system (Poulin et al. 2000). Assessment can be further complicated by the need to demonstrate a dollar value for desired changes in the target condition. Despite the difficulties in calculating the net benefits of social programs that strive to meet needs unmet by the market, accountability and evidence of efficiency are now routine requirements. Policymakers and public administrators should include a strong measurement component from the beginning of any program's design phase. That way, when called upon to report outcomes, they will be able to respond with some specificity and credibility to Mayor Koch's prescient question, "How're we doing?"

## Conclusion

Evaluation has been described most glowingly as a "shining path to social betterment" (Henry 2003) and more pragmatically, in its experimental form, as "a refining process superimposed upon the *probably* valuable cumulations of wise practice" (Campbell and Stanley 1963, p. 4). In either case, it is prized for the analytical rigor and empiricism it offers to public decision-makers in an era when evidence is increasingly valued more highly than instinct. By its application, it is hoped that social problems can be mitigated, public expenditures optimized, government transparency and accountability safeguarded, and public confidence in the democratic process restored.

# Project Management in Government Organizations, Russia

Igor Khodachek
Department of Comparative Political Studies, North-West Institute of Management, Russian Presidential Academy of National Economy and Public Administration, Moscow, Russia

## Synonyms

Management control system; Project planning framework

## Definition

Project management represents plethora of planning, accounting and management control techniques applied to deliver specific, often strategically important policy initiatives in hierarchical bureaucratic governance regime within certain timeframe, budget limitations and scope in order to satisfy key stakeholders.

## Introduction

The Russian story of project management in government organizations is interesting due to the overall strong role of the state in the country and its intricate bureaucratic ethos which are not in all ways similar to modern understanding of bureaucracy (Makeyenko et al. 1999; Sager and Rosser 2009). What underlying model that stands behind the contemporary Russian bureaucracy is a disputable question, while it is known to inherit both Soviet planning practices and New Public Management (NPM)-like corporate techniques. However, the corporate sector of Russia's economy in turn has its own specificity due to the dominance of state corporations and state-owned companies. Altogether this implies the prevalence of large top-down management control systems used

primarily to sustain existing hierarchies and therefore focused on compliance and reporting rather than effectiveness and efficiency.

Starting with early years of Post-Soviet Russia the project management practices developed gradually and gained state actors' attention only within a recent decade. The implication behind the federal government interest in project management were social investments within Dmitrii Medvedev's presidency and major infrastructure development initiatives of 2010s that required huge coordination efforts both from federal ministries and private suppliers in various sectors. Since mid-2010s, the so-called national projects became one of the main policy implementation tools together with program-based budgeting and state strategic planning framework.

At the current point of time the national projects serve as a ubiquitous top-down management control system that transcend from federal to the local level and secure long-term federal policy goals with 2030 as a planning horizon. The project management system, created within recent 15 years is complex and sophisticated and in many ways reflect the nature of Russian hybrid bureaucratic governance. The next sections explain the background of the current state of project management in government organizations and trace key steps in the development of project management practices in Russia.

## Hybrid Nature of Russian Governance

Russian state is known to be a successor to Russian Empire and Soviet Union. After collapse of USSR in 1991, Russia passed series of rapid societal transformations, which constructed hybridized governance framework that embraced management tools and technologies from different ideologies (Khodachek and Timoshenko 2018). Pollitt (2008) denies proliferation of Weberian *Public Administration* tradition in Russia due to the lack of democratic institutions and claims that Soviet background is an important feature that distinguishes Post-Soviet contexts from Western European democracies. Other scholars also claim strong sediments of Soviet past together with New Public Management (NPM) style of public administration (Antipova and Bourmistrov 2013), leading to principles of managerialism coming together with "rule of law," "expert knowledge," "secrecy," "tight control," "importance of plans," and "nomenklatura".

Besides, the Russian story of project management development becomes interesting because of the role of the state in economy and, therefore, potential project management market with its players. Since 1999, Russian state became its resurrection and regained control over 70% of the country GDP by 2015. This happened through nationalizing major assets with fueling the welfare infrastructure Russian state introduced new form of state-owned enterprises – state corporations, e.g., nuclear technologies (Rosatom), nanotechnologies (Rosnano), and high-tech industry (Rostech). Together with major state-owned enterprises like Russian Railways, Gazprom, Rosneft, Rostelecom, Rosseti, Sberbank, etc., the state corporations became an indispensable part of project management market in terms of consulting services, software and project personnel.

## Origins of Project Management in the Post-Soviet Russia

With minor exceptions public management innovations were not evident within the first decade of independent Russia. The few known include target-oriented budget programs and government accounting reforms. However, project management practices transcended into government organizations through Russia's engagement into international cross-border cooperation programs such as TACIS and Interreg.

Early 2000s marked the state renaissance in Russia that sparked the consequent interest in government modernization agenda, which, however, was primarily focused on budgeting and government accounting innovations (Aleksandrov et al. 2021) and has turned to projects only in 2005.

After several months of preparations, four major national projects have commenced on January 1st, 2006: "Health," "Accessible and comfort housing," "Education," and "Agriculture" (TASS 2019). The outputs of the first generation of national projects became one of the key achievements of Dmitrii Medvedev's shift as the prime minister and later his presidency.

The main idea of the national projects was the concentration of financial and administrative resources at the limited number of initiatives that altogether had to enhance the quality of life. Medvedev's election in 2008 has coincided with major financial and economic crisis, which has effectively restricted the ambitions of the national projects. Nevertheless, the basic project vocabulary was adopted by many government agencies and the prototype of the project office has been created at the federal government staff thus enhancing the overall project culture of Russian bureaucracy.

## Sochi 2014 Olympics as a Catalyst of Project Management Competences

The mass-scale application of project management techniques in Russia's public sector can be traced to Sochi 2014 Olympics when the federal government and Russia's National Olympic Committee had to create world-level infrastructure for winter Olympic games in Northern Caucasus mountains literally from the scratch. Besides outdoor winter sport facilities, hotels and stadiums, the Sochi endeavor included major transport infrastructure construction that engaged state corporations and state-owned companies such as Russian Railways (rail connection from Sochi to the Olympic village) and Rosavtodor (highways). The project management techniques relied on Project Management Institute (PMI) and International Project Management Association (IPMA) methodologies and employed professional software such as Microsoft Project and Oracle Primavera. Besides, the Sochi Olympics projects have raised several thousands of managers who have boosted project management competences in all sectors, government organizations included.

## National Projects as a Policy Implementation Tool

After the re-election of Vladimir Putin in March 2018, the federal government agenda focused on the second generation of national projects, which served as a strategic management tool to implement the promises made during the election campaign. President's decree #204 "On national goals and strategic tasks of development of Russian Federation until 2024" issued May 7, 2018 became policy framework for national projects in 12 areas. In October 2018, the federal government issued the government decree #1288 "On organizing project activities in Government of Russian Federation" that created the legal framework for design and implementation of national projects.

The decree #1288 introduced vocabulary and guidelines for project management in government organizations through four types of projects: national, federal, ministerial, and regional. In the hierarchy of government projects national projects provide the achievement of goals, indicators, and tasks set by decree #204, while federal projects provide the achievement of goals, indicators, and tasks set by national projects and ministerial projects provide the achievement of goals and indicators of federal executive authority (Decree #1288 2018). Regional projects provide the achievement of goals, indicators, and tasks of federal projects in the areas legally assigned to regional and/or local authority.

Thus, by the beginning of 2019, Russian federal authorities created comprehensive strategic long-term (5 year) national priorities agenda and a bureaucratic governance framework based on national projects to support the implementation of this agenda. The framework, which transcended all levels of governance is rather rigid in terms of delegation and control mechanisms but provides a certain degree of openness to accommodate new initiatives at lower levels of bureaucracy through ministerial and regional projects. This framework is supported by federal standards and national project management center of excellence at Russian Presidential Academy of National Economy and Public Administration (RANEPA), which provides retraining programs for civil servants and public sector managers.

While the ecology of project management techniques in Russian government organizations is primarily dominated by "hard" frameworks such as PMI, IPMA, and PRINCE2, a special tribute has to be paid to Russian agile community, mainly consisting of IT professionals. The agile project management ideology is also, although indirectly, supported by the Russian state through Sber, a state-owned bank, which is currently in the process of transformation into an IT company. In 2019, RANEPA has issued a comprehensive open-access guide "Agile-approach in public management" in cooperation with the federal Ministry of communications (RANEPA 2019). The guide addresses key features of agile framework and how it may be bridged with public management culture and consequently its application in government organizations.

## National Project Management Standards

There are three generations of national standards for project management in Russia. The first generation has been issued in 2011 and comprises of three standards:

- GOST R 54869 – 2011 "Project management. Requirements for project management" (GOST 2011a).
- GOST R 54871 – 2011 "Project management. Requirements for program management" (GOST 2011b).
- GOST R 54870 – 2011 "Project management. Requirements for project portfolio management" (GOST 2011c).

The second generation is a single standard issued in 2014: GOST R ISO 21500-2014 "Guidance on project management," which is identical to the international ISO 21500:2012 Guidance on project management (GOST 2014).

The third generation has been issued in 2018 and consists of two standards:

- GOST R 58305-2018 (GOST 2018a) "Project management system. Project office".
- GOST R 58184-2018 (GOST 2018b) "Project management system. Basics".

All standards are voluntary and are rarely referred to in official government project management guidelines, but serve as an important reference for the professional community.

## Conclusion

The project management in Russian government organizations carries many features essential for Russian public governance: hybridized nature, hierarchical top down control, and bureaucratization. At the same time, the project management practices in Russia have developed gradually within recent 30 years and have received valuable influence from internationally recognized techniques, methodologies, and frameworks. This influence may be traced back to cross-border cooperation projects in the 1990s and has continued with Sochi Olympics infrastructure projects, which would not have been possible to accomplish without a proper project management framework. With this said, starting with the first generation of national projects, the project management in Russia's government organizations is primarily seen as a policy implementation tool. Projects as such are valued because they provide concentration of financial and administrative resources and promise clear focused deliverables within certain budget and time span. Within recent 15 years, there has been issued six national standards on project management. The project management practices in government organizations in Russia are generally strongly influenced by "hard" frameworks and methodologies. However, there is a growing community that supports agile approaches and its application in the public sector.

# Proletarian Power

Mustafa Görkem Doğan
Faculty of Political Sciences, İstanbul University, İstanbul, Turkey

## Synonyms

Dictatorship of the proletariat; Proletarian rule; Rule by the working class

## Definition

Marxist political theory maintains that power rests with the dominant social class; hence, class rule is the only possible rule. The capitalist societies are ruled by the capitalist class, the bourgeoisie. Proletarian power then occurs when the bourgeoisie is overthrown by the proletarian class in order to establish a classless society. Proletarian power thus exists in polities in which the proletarian class is the ruling class.

## Introduction

The term proletarian power denotes that political power rests in the proletarian class in a society; hence, the proletariat is its ruling class. The term ruling class, by the way, did not enjoy a widespread use among the students of politics. Once Charles Wright Mills argued that it is "badly loaded" since it implies "an economic class rules politically" (Mills 1956) which did not fit into the liberal dichotomy between civil society and state in which these two spheres are remarkably remote from each other. However, the Marxist political theory argues that in a higher level of abstraction, only social classes rule. Therefore, according to

Marxist political theory, in any given polity, the dominant class holds the political power, and if proletarian class achieves to overtake the political power, we can talk about proletarian power.

In order to define and contextualize the proletarian power, first, we will briefly summarize differing approaches to the role of political power and its relationship to society at large and the Marxist critique of these theories. Then, the classes in the capitalist mode of production will be briefly explored; lastly, the theoretical analysis of some historical instances of proletarian power from the Paris Commune to the Russian Revolution will be explored.

## Who Rules?

Where do the rulers, the political elite, originate from in a polity? Apart from the Marxist tradition, the political theory does not usually point to a single factor in finding the answer to the question "who rules." The liberal theory assumes a divide between the civil society and the state so as to make the social relations in the former not to reflect on the latter. The asymmetrical power relations between different income groups, genders, or races have only an indirect effect in determining the cadres of the political elite according to this approach. Moreover, none of these social factors enjoys a special ascendancy over the others in influencing the political decision-making process. That is to say, one cannot single out one type of social relation in the civil society, conditioning the institutional structure and working of the government.

To sum up, the strict divide envisioned between economic and political spheres in the liberal political theory impedes the conceptualization of a meaningful link between the unequal economic relations in a society and relationships of power and dominance conditioning the political decision-making process of the same society. Hence Professor Mills above quoted remark on the awkwardness of the claim about an economic category acting in political sphere. Those who enjoy an advantageous status in economic relations in the society may have an impact on political decision making, but this is not a necessity according to the liberal political theory. Politics is an autonomous sphere of social relations. However, erasing the divide between civil society and state hence linking economics to politics does not necessarily mean that such theories would conceive class rule. The Hegelian approach is a case in point.

The Hegelian notion of state, in line with his philosophical method and disdain for liberal conceptions, assumes the transcendence of the particular interests represented in the civil society by the universal interest represented by the state as a whole (Hegel 1991). That is to say, the civil society is full of competing social groups representing their particular interests, and civil society is the sphere where this competition meant to exist, whereas the state is conceived as on top of these quarrels of particularities in order to rule these quarrels according to the universal interest of the whole. The civil society (bourgeois society if we prefer the literal translation) is the domain of economic relations between different sectors of society, say employers and employees, each vying for its particularistic claim based on its perceived interests. The civil society in this respect is full of antagonisms in need of resolution.

The resolution on the other hand cannot be crafted from within the civil society which is indeed the very domain of these competing interests. It must be given from a higher vantage point transcending these particularistic claims. This is where state enters the scene. The state apparatus must not be a party to the cited particularities and acts as a neutral arbiter among those. In this, the universal idea would be its guiding principle, meaning it would not succumb to particularistic interests existing in the polity and rule neutrally considering the good of the greater whole. Indeed, Hegel, to the dismay of a disenchanted Marx, refers implicitly to the bureaucracy as the social group representing the universal. In a word Prussian state apparatus rules the civil society by transcending the clashing particularistic claims of different sectors of the Prussian society. Therefore, there is a link between politics and economics, but this connection is a hierarchical relation

where the politics manage the economics. Hegel obviously perceives social ills of his time yet he relies on the state for their cure.

The young Marx objected vehemently to this schema while accepting that the political sphere has a close connection to the economic sphere. In his youth, he argues that only a democratic state which means a state representing every single citizen can be accepted as representing the universal. In that, he was still using the Hegelian formula, yet refuting Hegel's praise for the Prussian state. Where Hegel perceives a purposeful unity and the ultimate end of a progressive march of history, Marx sees a corrupted and reactionary political regime. Indeed, many of Marx's contemporaries saw the existing states as the main culprit of the social ills ravaging the humanity and suggest solutions accordingly.

About this time, Marx moved to Paris witnessed the lively radical working-class atmosphere and connected with Friedrich Engels who had similar experiences in Manchester. Later in the mid-1840s in Brussels, two men realized that, analyzed in a higher level of abstraction, the state is not the cause of social and political phenomena but rather a reflection of the social relations taking place in the civil society. Therefore, state is not a transcendent universal managing the antagonisms of particularistic interests taking place within the civil society; it is shaped by those very antagonisms. The main subjects of these antagonisms are social classes. Moreover, the Hegelian philosophical method is also refuted and reversed since the particular must be understood in order to grasp the universal and not vice versa. This is where Marx turned Hegel on its head, and this is why he undertook the study of the political economy resulting in the publication of *Das Kapital*.

## Enter the Proletariat

The Marxist tradition argues that to find the answer for the question "who rules," one must decipher the social relationship constituting the material reproduction process of a polity. In a higher level of abstraction, the mode of production comprised of social relations of production and forces of production determines the overall institutions of political power such as legal systems or even religions. The capitalist mode of production, the underlying factor behind the dominant political systems in Europe at least from the early nineteenth century onward, thus became the main target of analysis for understanding the power structure of the modern western states.

Who rules the capitalist state then? The simple and straightforward answer is "bourgeoisie." Marx calls the capitalist class as the bourgeoisie since this is the term used by the students of the French Revolution at the time. The bourgeoisie overthrew the old political order in France. They replaced the old ruling class since "a group that can embody society's universal interest in a permanent way but in a particular historical context, the context of revolution, the universal significance of a given class may coincide with its particular role, its selfish interests may at this conjuncture coincide with the interests of the masses and the universal rights of society" (Draper 1977). This means simply that in Hegelian terms, the particularistic interest of the bourgeoisie in the context of the French revolution matched the universal interest of the humanity. Consequently, the bourgeoisie was able to shape the political power in its own interest on the basis of its dominance in the civil society, in the social relations of production.

The history did not end there though according to Marx. The particularistic interest of the bourgeoisie came short to heal all the social ills that thwart the human emancipation. The class antagonisms continue to exist in the civil society under the capitalist mode of production pitting proletarians against bourgeoisie. Naturally social cleavages visible in the civil society are more complex than a mere two-faction struggle, yet on an abstract level, all of these competing interests can be regressed to this basic antagonism where proletarians defied the bourgeoisie. But who are the proletarians?

Social classes are often mentioned in Marx's own work, yet the only attempt to define them is an incomplete chapter at the end of the third volume of the *Capital* where Marx argued that having a common source of income does not

bind people into social classes and said nothing else (Marx 1977). A strict Marxist definition of the term must emphasize that proletarian class does not own the means of production and hence economically forced to choose to sell their labor power for their subsistence in the capitalist society. The term in its Roman usage denotes the citizens with the lowest income, and during Marx's time, the term was still in use to imply the poorest section of the capitalist society. Marx gave it a specific meaning as one of the two main social classes under the capitalist mode of production. More importantly, proletariat is the class whose particularistic interest overlaps with the universal interest of the human emancipation under the social and economic circumstances of the capitalist system. Therefore, in the coming revolution that would overtake the capitalist system, it will play the part played by the bourgeoisie in the French Revolution.

## What Does Proletarian Power Entail?

According to the Marxist tradition, proletarian power is not a mere political utopia. In the preface to the 1891 edition of Marx's third book of the French Trilogy, *The Civil War in France*, Friedrich Engels cited the Paris Commune as the perfect example of the dictatorship of the proletariat. Thus, the 9-week experience of the Parisians with self-rule actually is an example of the proletarian power at work. Indeed, Marx's book is a vivid description of the political machinations leading to the days of commune and of the politics during the heroic days of Parisian defiance. Marx not only delved into the daily events (in fact, the foremost chronicler and witness of the Commune Prosper-Olivier Lissagaray was one of his close friends), but most importantly, he analyzed the deeper motives that condition the political strategies of the social actors. Thus he shed light on the class basis of the politics.

During the Paris Commune, the executive and the legislative powers were united in a single body assembly consisted of ninety-two seats. That means roughly one representative for every twenty-thousand Parisians. Commissions were established to oversee the daily management of the city. The Central Committee of the National Guard also played a prominent role in the Parisian politics. At last, the Commune was brutally terminated by the forces of bourgeoisie. Marx hailed the Commune and the Parisian proletariat as the harbinger of the coming society (Marx 1933). This new society still needed mechanisms of political rule, but its ultimate goal would be the withering away of the state apparatus. Thus, proletarian power, the dictatorship of the proletariat, would compose a caretaker ruling class, while the social transformation amounting to complete human emancipation will eradicate the material basis and the means of class rule including the institution of state.

This short-lived instance of proletarian power in Paris set the example for the future generation of revolutionary politicians who are interested in working-class politics. They tried to draw lessons both from the heroics and shortcomings of the Paris Commune. However, the history during the last quarter of the nineteenth century proved that the capitalist system is resilient enough to respond successfully to the demands of the working people so as to prevent proletarians to constitute a politically self-conscious social class ready to press its political claims. The particularistic political and economic claims of the proletariat to destroy the shackles of capitalist mode of production which according to the Marxist theory would embody the universal goal of emancipation of humankind did not coincide with the context of political revolution. Political revolutions did occur as in 1905 in Russia or in 1908 in Ottoman Empire, yet apart from constitutional changes, nothing of the sort of sweeping structural social transformation in the mode of production took place.

Within this very context, a thorough theory and practice of proletarian revolution was put forth in Russia in 1917 as a result of fast-moving political events under the circumstances of the First World War. Thus, to complete our analysis of proletarian power, we will return to Lenin's well-known book *State and Revolution*. Lenin planned to write a book on the Marx and Engels ideas on the problem of state especially in the aftermath of the

decision by the national social democratic parties to support "their" countries in the World War. He argued that the wrongful thoughts and analysis by Karl Kautsky and Georgi Plekhanov on the issue of state and political power that they attributed to Marx and Engels must be criticized severely. His preparation bore fruit in August and September of 1917 when he had to hide in Finland just before the October Revolution.

The book contained six chapters, in which Lenin elaborated the analysis of Marx on the political power in class societies, his considerations on the 1848 revolutions and the Paris Commune, the contribution of Engels on the subject, the transition to communism from capitalism, and the distortion of the Marxist thought by the revisionist theoreticians like Kautsky. The *State and Revolution* is considered as the foremost compilation of the Marx and Engels ideas on the origin of political power in capitalist societies and the transition to communism from capitalism and the role of politics in this process.

The main argument is pretty straightforward. As discussed above, the political power rests with the ruling class, the class which has the upper hand in the social relations of production prevalent in the civil society. Then, on a higher level of abstraction, state power is a reflection of this power structure within the civil society. Thus, in the capitalist society, state is the executive board of the bourgeoisie. Proletariat on the other hand is the only social class capable to overthrow the bourgeois state under the capitalist mode of production since its interest coincides with the universal interest of the human emancipation in the specific historical instance of capitalism. A political revolution thus can pave the way for the transition to a communist mode of production under the guidance of proletariat (Lenin 1932).

The need for a political revolution arises from the need to dismantle the bourgeois state apparatus since the proletariat simply cannot rule through it. Changing the staff of police force or diplomatic corps would be a futile attempt. Proletarian class needs another set of political tools in order to oversee the period of transition to communism, and a transition period is needed because as already cited without changing the power balance in the social relations of production, thus the power balance in the civil society, one cannot expect to overthrow capitalism. Therefore, the proletarian power's objective is to administer the period of transition to communism. In this, on the one hand, the bourgeois institutions of political power must be destroyed, and on the other hand, in a parallel process, a social revolution must take place in the civil society.

According to the Leninist approach, the principal political institution of the proletarian class is its political party made up of the politically conscious sector of the working class. That is why the party is described as the vanguard of the proletariat. In order to break apart the bourgeois state institutions and to act as a substitute political institution to manage the societal transformation required for the transition to communism, the vanguard party constitutes itself as a proxy state. Furthermore, a new type of political institutions in line with the experience of the Paris Commune was also devised, the chief among them being the soviets. Soviets, which are local assemblies constituted by workers, operate as governmental bodies. These grassroots political organizations had a direct effect over the social relations of production in the civil society, thus instrumental in the social transformation of the capitalist society.

The dictatorship of the proletariat then is the name of the political mechanism that oversees the transitional period to communism during which the state withers away. The communist utopia does not entail a state apparatus since the class rule won't exist anymore under this final phase in human emancipation. Democracy or dictatorships are all only names for mechanisms of class rule according to Marxist tradition which cites the evaporation of such political mechanisms of obedience among its final objectives. Therefore, the proletarian power is not the final end but a vehicle for reaching the ultimate goal. By the way, it must be noted that especially anarchist participating in the Russian revolution heavily criticized the Bolshevik version of the proletarian power since in practice it means the rule of the socialist intellectuals through the political party claiming to represent the whole working class (Makhno 2016). The continuation of state institution under the

proletarian label for the sake of an allegedly necessary transitional era was an affront to the anarchist ideal.

## Conclusion

The ideal of proletarian power nowadays seemed to be an affair of the distant past. Although the stealing away of the democratic governments by the plutocrats, the super rich, is a very current concern in political debates, none talks about class rule. The present situation is considered as an anomaly that must be remedied by a genuine democratic fix rather the rule in capitalist societies as Marxist suggested from the mid-eighteenth century onward. The left-leaning populist political rhetoric of the present debates does not envision a proletarian takeover of the political power but the establishment of a popular democracy that will include every citizen in the political decision-making process. The younger Marx from the 1830s would concur with this proposition; 10 years later, he had a better understanding of the capitalist mode of production. Possibly, 10 years from now, some of our contemporaries might also change their mind.

# Pronatal Responses to National Decline

Lon Felker and Paul C. Trogen
East Tennessee State University, Johnson City, TN, USA

## Synonyms

Birthrate decline; Demographic policy; Infertility

## Definition

Population decline: a decline in aggregate birthrate of a population.

## Introduction

> "Every human society is faced not with one population problem but with two: how to beget and rear enough children and how not to beget too many."
> M. Mead, 1950

At "the turn of the twenty-first century, fertility decline and sub replacement fertility have become widespread" (Morgan and Taylor 2006). All first-world countries reproduce below the 2.1% replacement rate (Last 2013: 8). According to UN projections, by 2050, 75% of all countries in the world will have below replacement rate fertility (Last 2013: 26). Falling birthrates create greater challenges than population growth. One of the stiffest headwinds slowing recovery from the C. global financial crisis is demographics (Ip 2015). "There is no precedent in human history for economic growth on declining human capital" (Last 2013: 36).

## Demographic Transition Theory

Two demographic transitions transformed the human race from high to sub-replacement fertility. Long ago, such as during the Middle Ages, infant

mortality was high, so women used to give birth to more children than they desired, expecting some would not survive. When progress caused infant mortality to decline, more children survived and the population grew. The population surge causing Malthus (1798) to raise an alarm. Parents' also realized more children were surviving, and they started having fewer children until they approximated their desired family size. This reduction in fertility to match desired family size is called the first demographic transition.

The second demographic transition occurred when families left farms to live in cities and work in factories. On the farm, children were an asset as they produced more than they consumed. When families moved to the city, children who once were an asset became an expense and an impediment to economic mobility (Last 2013: 87–96). The second demographic transition reduced desired family size. "Developmental changes that transformed Europe from a predominantly rural-agrarian to a predominantly urban-industrial society accompanied the transition from high to low levels of fertility" Knodel and van de Walle (1979: 217).

If development is the best contraception (Pritchett 1994), it works all too well in developed countries. Every member of the European Union has less than replacement level fertility (Hoorens et al. 2011: 1). Nature has not provided a self-correcting mechanism to stabilize fertility once it falls to replacement level (Kohler et al. 2002: 641). Once fertility transition has begun, it does not stop until births fall below replacement rates (Morgan and Taylor 2006). The second demographic transition theory predicts sub-replacement fertility and will be "structural and permanent" (Last 2013: 94). Industrialized nation-states do not produce enough children to sustain their populations (ibid).

## Sub-replacement Fertility

### 1930s Sub-replacement Fertility

Demographers in the 1930s detected fertility levels in Europe well below two births per woman (Morgan and Taylor 2006). Teitelbaum and Winter (1985) recount that France during the 1930s and 1940s suffered considerable anguish regarding the perceived "withering" of the nation. Young childless couples were accused of shirking their patriotic duty. French, as Teitelbaum and Winter note, has a term for a birthrate decline: *denatalite*, which "carries a much stronger (and more negative) emphasis than its English equivalent" (1985: 3).

### Postwar Baby Boom

The debate over fertility declines was muted by the postwar baby boom in every industrialized European nation and quite a few non-European ones. Andorka (1978: 120) observes:

> After the Second World War the pessimistic population projections proved to be wrong. In the most developed western European countries, as well as the United States and Canada, in Australia and New Zealand, and in the white population of South Africa, the trend of fertility changed, with a rise of all fertility measures which was popularly called the 'baby boom.'

Initially the experts attributed the fertility rise to postwar replacement; the rates remained high so long that it appeared that the secular trend of low fertility had shifted to higher rates. In hind sight, such projections of continued high fertility were shortsighted, and the baby boom soon proved to be an anomaly.

### Baby Bust

The baby booms of the post-World War I and post-World War II eras must now be viewed as ephemeral phenomena. These were temporary responses to one-time events, which failed to reverse the overall fertility decline. Japan, for example, had a baby boom from 1946 to 1951, following which its birthrate fell by half (Arentz 2015). Fertility dropped in every industrialized nation between 1960 and 1980: Canada, 3.8 to 1.8; the Netherlands, 3.1 to 1.6; the United States, 3.7 to 1.8; and West Germany, 2.3 to 1.5 (Last 2013: 15).

### The New Normal

Below replacement fertility is the new normal. There is no reason to think fertility will rise above replacement level. No country has

exceeded replacement level fertility for 5 years after falling below it (Morgan and Taylor 2006). Low fertility reshapes a population structure, with more adults, and eventually more retirees, than children (Last 2013: 26).

## Sample Attempts to Reverse National Decline

There appear to be three basic rules for pro-natal policies:

1. Below a certain point, there is no turning back (Last 2013: 159). There are no reasonable grounds for believing fertility will rise above replacement rate. After a five-year decline below replacement level, no nation has ever risen above it (Last 2013: 24).
2. Any effort to increase fertility must be long term, over several generational cohorts, as is suggested by the relatively successful efforts in France and Scandinavia (Last 2013: 160).
3. People cannot be bribed into having babies they do not want. Childbirth is difficult and painful and leads to unhappiness. 5.6% fewer adults describe themselves as "very happy" once they become parents (Caplan 2011: 15; Last 2013: 160).

Russia, Germany, and Sweden provide examples of nations promoting pro-natal policies. Russia is representative of fertility decline in post-communist Eastern Europe. Germany is the largest country in the European Union and is representative of the fertility problems of highly developed countries. Sweden, like other Scandinavian countries and France, while still suffering from sub-replacement fertility, is an example of countries experiencing more success and the highest fertility in Europe.

### Russia

> Russia's challenge is a double whammy. Like most of the developed world, birthrates have fallen far below levels that would sustain the population... Russian death rates, particularly among the working-age males, have skyrocketed due to post-Soviet poverty, substance abuse, disease, stress and other ills. (Weir 2002)

Russia's population plight is one of the most dire in Europe. The fall of the Soviet Union ushered in free-falling population. Russia's total fertility rate (TFR), which was estimated at 2.2 children per woman in 1988 (before the fall), fell 1.41 by 2009 (Miljkovic and Glazyrina 2015). More women have abortions than give live births (ibid). Male life expectancy has also fallen 6–59 years, with the average for females falling 2–72 years (Weir 2002).

Population of Russian Republic

| Time period | Population |
|---|---|
| Soviet Era | 148.3 million |
| 2002 | 145 million |
| 2006 | 142.5 million |
| 2009 | 140 million |

Data Source: Miljkovic and Glazyrina 2015: 961–962

At current rates, the Russian population will halve in 43 years (Morgan and Taylor 2006). The road to a normal population distribution will be difficult for Russia. Low birthrates during the economic upheaval caused by the fall of communism leave a small current population of childbearing age.

#### Immigration

One ray of hope amidst demographic gloom was the return migration of many ethnic Russians from the former Soviet states of Central Asia, the Caucasus, and the Baltic following the breakup of the USSR. However, the immigration stream is slowing. This flow is hardly sufficient to compensate for the long-term fertility decline.

Internal immigration within the Russian Republic is less of a blessing. Rural to urban migration was difficult during the Soviet period because of internal passports and population movement controls. Under Putin, some of these controls were relaxed, and it is conceivable that some of Russia's reduction in fertility is a by-product of the natural reduction of family size that accompanies rural to urban migration.

Moreover, the long-standing xenophobia of Great Russians toward other people makes it unlikely that non-Russian immigration can account for the gap in fertility. Long-standing hostility against Asians makes opening up

more immigration from China politically unacceptable (Weir 2002).

### Policy Initiatives

In Vladimir Putin's speech to the Russian parliament of May 10, 2006, he called the population decline "the most acute problem of contemporary Russia" (Rosenberg 2010). Putin offered to provide incentives for families to have a second child. The measure was enacted on December 29, 2006. Entitled the Federal Law of the Russian Federation No. 256-FZ "On Additional Measures of State Support of Families with Children," the law permits state support of families with children in the form of the mother's capital to be available upon the birth/adoption of a second or more children in the period from January 1, 2007 until December 31, 2016 (Miljkovic and Glazyrina 2015: 962).

These funds could be used to improve housing conditions, contribute to education of the child, and set up the contributory portion of the mother's labor pension. The funds were accessible 3 years following the birth or adoption of the second or third child. The amount of the mother's stipend was set at 215,000 rubles ($7722), which was eventually increased to 300,000 rubles ($9267) on November 1, 2013, and, by January of 2010, to 343,378.80 rubles (roughly $10,607) (Miljkovic and Glazyrina 2015: 962).

According to *Eurasian Daily Monitor*'s report (Bernstein 2008), a "demographic explosion" had occurred, with two million children born in Russia between January 1, 2007, and April 1, 2008. While the government's 2006 law did have a positive effect on the Russian total rate, the effect was of small magnitude. Furthermore, researchers predict that the law, which expires in 2016, might have limited impact beyond its expiration date. Miljkovic and Glazyrina conclude that the policy will continue to contribute to an increasing birthrate in the next few years, "but the rate of this increase will hardly be enough to reach the level at which the population can reproduce itself" (2015: 971).

While Federal Law 256-FZ "On Additional Measures of State Support of Families with Children" exerted a small positive effect of fertility in Russia, policies to create more jobs and improve healthcare would have a greater impact on fertility (Miljkovic and Glazyrina 2015: 971–2).

## Germany

Germany is the largest country in the European Union (PRB 2011). Since 1972, deaths have exceeded births every year (ibid). At the current rate, the population of Germany will halve in 46 years (Morgan and Taylor 2006).

Germany's experiences with population policy have been mixed and unique. First, the severe loss of life during World War II created a gender imbalance that lasted a generation. Second, Germany was divided from 1945 to 1989 into two nations, one capitalist and one communist. Total fertility rates were similar in both Germanys beginning with the baby boom era from the late 1950s until 1975 (PRB 2011). Each part of the country followed different policies.

### Immigration

West Germany did little to reverse low fertility (Cottrell 2013). And fertility remained below 1.5 children per woman since 1975 (PRB 2011). West Germany embarked on a program of labor importation in the late 1950s and 1960s. West Germany imported large numbers of foreigners ("guest workers" or *Gastarbeiter)* from southern Europe, Iberia, and the Middle East.

East Germany had an additional population problem due to the attrition of population in the form of refugees to the West. Only with the construction of the Berlin Wall in 1962 did this hemorrhage of population cease. Following Germany's reunification in 1990, many ethnic Germans who had lived behind the iron curtain arrived in Germany, 800,000 in 1992 alone (PRB 2011). At the end of 2009, 19% of Germany's population was immigrants and their offspring (PRB 2011).

German life expectancy increases, combined with decreased fertility, contributed to the phenomenon of population aging (United Nations Population Division 2000: 37). The potential support ratio dropped from 6.9 persons aged 15–64 years per person aged 65 in 1950 to 4.4 in 1995. Maintaining a workable 4.4 level of support

would require "an influx of 3.4 million migrants a year. . .more than ten times the yearly amount of migrants entering Germany during 1993–1998" (United Nations Population Division 2000: 38). Only an aggressive immigration policy would stop a decline in support ratios. The United Nations study on Germany concludes: "In absence of migration the retirement age would have to be raised to 77 years to obtain the same 4.4 potential support ratio" (ibid).

Immigration alone cannot be considered an adequate approach to population decline. France, from the middle of the nineteenth century until World War II, used immigration that was always regarded as an economic regulator to meet employee shortages (Chesnais 2000: 14). Chesnais notes immigration policy does not address demographic considerations such as the repair or rectangularization of the age distribution. He notes, "[s]uch an imperative would need a solution totally opposed to basic human rights: the import of children without their parents" (Chesnais, ibid).

As a member of the European Union, Germany must abide by the Schengen Agreement (PRB 2011) which allows open entry from other EU states. Currently, the influx of a large Middle Eastern migrant stream of refugees from Syria, Iraq, and other Islamic nations greatly complicates any assessment of immigration as factor in population growth in Germany. Tentatively, a large Moslem presence in Germany might have a dramatic effect on short-term and long-term population growth, given the higher fertility rates in Middle Eastern countries. Many immigrant populations have distinctive birthrates upon arrival, only to see those birthrates usually adjust toward that of their host country. Whether Middle Eastern immigrants will assimilate into their host culture and absorb German fertility attitudes remains to be seen. Integrating Germany's Turkish minority has proven difficult (Cottrell 2013). Even Chancellor Angela Merkel admitted integration was "not working" (PRB 2011).

### Pro-natal Policies

The East Germans lacked the resources and the access to foreign labor markets accessed by West Germany and consequently relied on socialized medicine and an official pro-natal policy along classical socialist lines, maternity leave, childcare subsidies, and family allowances with greater allowances for additional children. Fertility rose in East Germany above that of the West and stayed strong until reunification caused economic disruption and outmigration from East Germany to the West (Cottrell 2013). After reunification, fertility in the East fell sharply to 0.8 by 1995 before gradually converging with the average level of the new unified Germany (PRB 2011).

West Germany experimented with modest monthly child allowances before reunification. In 1982, the Federal Republic offered only DM 50 for a first child (approximately 20 USD), DM 100 for a second, and DM 220 for a third. Thus, a one-child family received only DM 50, while a three-child family got DM 370 (Teitelbaum and Winter 1985: 116). West German policy had little impact.

The total fertility rate (TFR) in reunified Germany has remained between 1.3 and 1.4 children per woman, one of the lowest in Europe (Hoorens et al. 2011: 27). German women were among the first to postpone childbearing until later in life (Hoorens et al. 2011: 28). Postponed fertility implies some level of fertility foregone (Morgan and Taylor 2006). Fertility among women 20–29 years old has decreased, and more births are postponed until women are 30 years of age and older (Hoorens et al. 2011: 27).

Germany is in a disadvantageous situation because of low desired fertility rates. Germany's low desired fertility is due to many who would like to remain childless, a preference which has become widely accepted (Hoorens et al. 2011: 29). Germany has a cultural preference for childlessness due to a commitment to career (AICGS 2015). When the European Commission's 2001 Annual Eurobarometer survey asked German women 15–24 what their personal ideal number of children was, the result was 1.8 children (PRB 2011) compared to 2.0 only 5 years previously, and 2.6 in neighboring France. Since realized fertility is lower than desired fertility, the number of desired children sets an upper limit on fertility, not a floor. A 2001 survey of German

women 18–34 years of age found nearly 17% said "none" was the ideal number of children, and 9% said "one," percentages which far exceeded those of women giving similar answers in other EU countries (ibid).

Potential German mothers face significant headwinds if they contemplate having a child. Only 25% of German survey respondents consider Germany to be a child-friendly country (Hoorens et al. 2011, p. 31). This compares unfavorably to 80% in neighboring France, whose fertility rate of 1.87 also compares favorably to Germany's at under 1.4 (ibid). German childcare is inflexible and is among the worst in Europe. German childcare is open for few hours and is only subsidized for 3 h a day, not long enough for women with children to have jobs (Hoorens et al. 2011: 32). Most preschools close at 1:00 pm (PRB 2011). Many working mothers find themselves in poorly paid, 17 h a week "mini-jobs" paying about $600 a month (Cottrell 2013). A quarter of Germany's female workforce holds such mini-jobs (ibid).

German culture opposes working mothers and disapprovingly calls them *Rabenmutter* (raven mother) because the raven abandons her young at an early age (PRB 2011). Germany's policies reinforce cultural assumptions in which the males are the primary breadwinners (Hoorens et al. 2011: 32) and women are dependent on their husband's earnings. If German institutions do not support working mothers, marriage becomes a prerequisite for childbearing, which may partially explain later pregnancies in Germany. Furthermore, the number of marriages contracted in Germany has fallen to its lowest level since 1950 (Hoorens et al. 2011: 30).

Unified Germany's family benefits are now among the highest in OECD countries (AICGS 2015). The German government now gives 184 euros monthly allowance (approximately $200) for the first and the second child, 190 for the third, and 215 for the fourth, until each child turns 18 (or 25 if still in school) PRB 2011). Today Germanys spends $265 billion a year on family subsidies (Cottrell 2013); still the fertility rate lingers at about 1.4 children per woman.

## Sweden

Swedish fertility, while still below replacement levels, is the highest in Europe (Hoorens et al. 2011: 75). In the 1930s, Sweden had one of the lowest fertility rates in the world (Wells and Bergnehr n.d.). Furthermore, considerable emigration occurred (mostly to North America) around 1900, and during the 1930s, population growth fell to 0.3%. A national family policy was instituted, largely inspired by Gunnar Myrdal's (1935) study of the population crisis (Myrdal and Myrdal 1935). The first of many laws reconciling work and parenting began with laws which prohibited dismissing women from employment for marriage, pregnancy, and childbirth and providing free childbirth services and healthcare for both mother and child (Wells and Bergnehr n.d.). The birthrate slowly rose over the subsequent decades, only to decline with the introduction of modern contraception in the mid-1960s (Sweden SE 2003). Sweden again registered below replacement fertility rates in 1968, followed by Denmark and Finland. In the 1970s, the Swedish birthrate declined to 1.6 children per woman. Then, the pattern reversed dramatically. By 1990, Sweden's birthrate was 2.1, one of the highest in Western Europe. The Swedish experience contradicted conventional wisdom about fertility and the inevitability of population decline.

## Immigration

The only other policy response concerned immigration. From the 1950s to the end of the 1960s, immigration came mainly from other Nordic countries and from southern Europe, principally Yugoslavia, Greece, West Germany, Turkey, Great Britain, Poland, and Italy. Labor migration was the principal form: immigrants seeking better working conditions and pay. With changing economic conditions in the 1970s, the relatively open immigration was ended with tighter restrictions. Subsequently, the major exception for limited immigration was for cases of political oppression. This pattern only changed in late 1980s and early 1990s, when the numbers increased.

According to one source (sweden.se/templates/Factsheet):

> By 2001. . .“476,000 foreign citizens were living in Sweden. In other words, every 20th person. . . is a foreign citizen and every tenth was born outside the country. The largest group are the Finns, of whom there are some 100,000. The second largest group is from Iraq with 36,000, followed by Norwegians 33,000, Danes 26,000, Yugoslavs 21,000, Bosnians 20,000, Germans 17,000, and Poles 15,000.”

Sweden is a member of the European Union, and a participant in the Schengen Agreement, in which it has open borders with other member states. Like Germany, Sweden is a destination country for people fleeing war in the Middle East.

### Pro-natal Policies

As a highly urbanized, industrialized nation-state with high female participation in the workforce and politics, Sweden exemplifies a highly modern nation. Sweden also has considerable premarital cohabitation, a high divorce and separation rate, which usually associated with reduced fertility. Sweden’s policy response to the perceived post-pill fertility decline was to increase family allowances slightly and institute maternity leaves for mothers and eventually for fathers.

In contrast to stable low fertility in Russia or Germany, Sweden has volatile or “roller-coaster” fertility (Hoorens et al. 2011: 72). Sweden is atypical because it enjoys pro-cyclical fertility, meaning more births occur when the economy is growing (Hoorens et al. 2011: 59). Neoclassical economic theory predicts a countercyclical relationship in which career and children are alternatives. In Sweden, family and career are compliments. In the 1990s, Swedish fertility rates declined in line with other European countries, mirroring worsening economic trends, the less generous family allowances, and leave provisions (Hoem and Hoem 1996). Sweden then re-experienced “roller-coaster fertility,” rebounding from a low of 1.5 in 1999 to 1.9 by 2008 (Hoorens et al. 2011: 72).

Sweden is a child-friendly country. In Sweden, most preschools are open from 6:30 am to 6:30 pm, and the government is investing in additional hours (Nordfors 2013). Fees cannot exceed 3% of family income (ibid), and families receive a monthly allowance equivalent to 80% of the maximum monthly cost of 1.287 of Swedish Krona (about 196 USD) (Åkerström 2016). The monthly allowance (*barnbidrag*) continues until the child reaches 16 years of age (ibid). Furthermore, the first 525 h of preschool (*förskola*) per year is provided free of charge (Nordfors 2013). Each child is entitled to 480 days of paid parental leave when they are born or adopted to be used from birth to age 8. Two months of paid leave is reserved for each parent (is nontransferrable), and parents get an equality bonus (*jämställdhetsbonus*) if 270 days of the bonus are divided equally between mother and father (Åkerström 2016).

Swedish women desire both families and career (Hoem and Hoem 1996). The pro-natal policies of both Sweden and France focused on reconciling work and family (AICGS 2015), and both have enjoyed close to replacement rate fertility. Swedish social policy, which encourages an egalitarian dual-earner household where both partners share in raising children, has led to one of the highest fertility rates in Europe (Hoorens et al. 2011: 74–75), a halt in the postponement of first childbearing at younger ages (Andersson and Kolk 2011), and made second and even third births more common, especially among women in professions with the most flexible working conditions (Hoorens et al. 2011: 75).

## Conclusion

A familiar analogy to the motivations to have children can be found in Frederick Herzberg’s theory of work motivation (Herzberg et al. 1959). Herzberg found that one set of factors motivated people, and a second completely different set of factors de-motivated them. A similar dichotomy also appears in the motivations whether or not to have children.

**Motivators** Herzberg’ motivators were intangible, abstract, and sometimes even ethereal, like self-actualization, achievement, and growth. The reasons for the natural urges to have children sound equally intangible and abstract are the

desire to be a parent, wanting a child to love (Morgan and Taylor 2006), a biological urge to pass on one's genes, and/or a desire to please parents.

**De-motivators** De-motivators in Herzberg's model were much more tangible, like salary, security, and working conditions. The de-motivators for having children are also tangible, like the high cost to raise a child, high unemployment, economic insecurity, and social instability. In Herzberg's model, favorable conditions in the de-motivators, like a good salary, job security, and good working conditions, alone were not enough to motivate. Only motivators could do that. But unfavorable de-motivators, like an inadequate salary, job insecurity, and unfavorable working conditions, may quench the influence of motivators. Likewise, favorable conditions among the de-motivators, such as adequate money, economic security, peace, and prosperity, alone are unlikely to motivate a woman to give birth. But unfavorable de-motivators can cancel the influence of motivators. Conditions which make it difficult to reconcile family and career are de-motivators, such as the lack of affordable childcare, fierce competition for scarce jobs, inflexible job requirements, and economic insecurity. De-motivators can cause people who otherwise might want a child decide not to have one.

De-motivators can make motherhood appear impossible. Women in their prime childbearing years are young. They are still pursuing higher education, or hold entry level positions. At this stage of life, the costs of pregnancy and childcare can appear insurmountable. A low fertility trap springs from the inability of women to harmonize career and family obligations (Morgan and Taylor 2006).

Economic uncertainty is another potent de-motivator. The onset of sub-replacement fertility in Europe coincided with the Great Depression of the 1930s. Rapidly falling fertility in Eastern Europe occurred at the demise of communism. Women rationally reduce their exposure to economic uncertainty by delaying pregnancy (Kohler et al. 2002: 652).

Incentives alone are inadequate. Germany and Sweden provide similar monthly allowances for each child, yet fertility in Germany is among Europe's lowest and Sweden the highest. One major difference is that Sweden has from the 1930s sought to reconcile work and motherhood. Swedish childcare is affordable and available the entire workday, so a woman can have both a child and a career. The Swedish built incentives into their system to encourage male parents to share in child-raising responsibilities. In contrast to the Swedes, who reconciled career and family, in Germany childcare is only half day. The German burden of childcare falls on the mother. German women find it difficult to reconcile career and family. Work and family are alternatives, and many German women understandably pick career.

If development is the best contraceptive, it works far too well in developed countries. Women understandably want higher education and careers. Policies which help women reconcile career and family help low fertility countries escape the low fertility trap.

## Property Insecurity and Globalization

Arthur T. Denzau
Department of Economics and Finance, Utah State University, Logan, UT, USA

How does globalization, here deemed opening up a nation to external economic forces, affect the enforcement of property and contract rights in a society? This has been a largely neglected area in the academic literature. But the arrival of foreign interests has set off complaints and demands for better treatment by domestic citizens in many places in the globalizing world. These demands are often the result of changing perceptions as to what the government should be doing in the economy, changing mental models (MMs).

Opening up to outside economic forces (globalization) affects many parts of the economy and society. A key question we focus on here is how does globalization affect MMs and prices, opportunities for corrupt acts? The opening can be a difficult time for keeping public administration effective and free from corruption. The resulting problems can reduce the security of property, especially for domestic citizens and businesses, as the focus of government's actions turns to its relationships with the rest of the world.

A common expectation has been for globalization to have beneficial effects on domestic institutions, including governmental corruption levels. Overall, in the long run, this is likely

right, but there are key exceptions and problems along the way.

Globalization has been a strong powerful force in lifting hundreds of millions out of poverty, but is not without a variety of costs. Here we focus on the effects of globalization on the security of property rights. This is an important but largely neglected aspect of globalization.

The one aspect of this that has had a small literature is the effect of FDI (Foreign Direct Investment) on institutional development, including property rights. Lee and Choi (2011) focus on this question directly, while previous work had looked only at the channel of FDI increasing competition for domestic firms. Lee and Choi disaggregate FDI and find that mining FDI can make corruption better or worse, depending on initial institutions: if institutions are good, such FDI reduces corruption, but if bad, then the FDI makes corruption even worse. Service FDI tends to reduce corruption. This has been corroborated by others, who also show that FDI into service industries improves institutions and reduces corruption.

The effects of opening up to the world economy (globalization) have both short run and longer run effects, which can be quite different. Further the effects may vary due to the sector of the economy affected, the types of interactions, and the quality of property rights institutions before opening up. In addition to these effects, there are also likely to be major effects on the ways that citizens and leaders perceive things related to property rights – their MMs (mental models) of property rights.

The differential timing of effects is important in many areas, such as the overall costs and benefits of any economic liberalization. Typically, we expect the costs to be felt more immediately than the benefits, and especially in terms of political reactions. Here, the story is more complicated.

## Short Run and Longer Run Effects

### Short Run

One possible effect is for there to be a shift from one of several equilibria to another. The initial equilibrium is often a high corruption, poor institutions one. In the short run, changes may shift from equilibrium high level of corruption to lower corruption level. The new environment can create incentives for the corrupt to take the money and run strategies, cashing out and exiting the new environment. This can result in a confused situation and a government that may be less able to function, after losing some key people who did something, albeit in response to corrupt payments.

Land may become more valuable – some land – and be more likely to be taken by corrupt officials, who use it to have something to replace their old jobs. Due to a system of incomplete registration of land ownership, based only on specific paper documents, this was what occurred in Thailand during the late stages of the 1990s boom. Certificates granting some ownership rights were being issued to farmers in land reform schemes, but the value of the land being transferred had risen substantially due to Thai's economic boom resulting from globalization. Some politicians, working with their friendly bureaucrats, were able to get these certificates issued to themselves. After a period, they were able to upgrade their ownership rights and sell the corruptly acquired land. The path from globalization to rising asset prices to corruption was quite clear.

Before a new institutional situation is completely in place and enforced, property rights may be quite insecure. Owners of more valuable assets may now be vulnerable, as their old contacts and means of protecting their assets no longer function. The government may go after their assets, either claiming them the result of a corrupt bargain or as simply a useful source of revenue held by a politically weakened owner. The opening up of Mexico starting in the 1980s has greatly weakened its formerly dominant political party, PRI, reducing its supporters' ability to protect monopoly positions in various industries. These include telecom, trucking, and even the constitutionally protected oil industry that had fallen so far behind in terms of its technology for exploiting undersea oil pools.

Two other avenues of changing MMs are also suggested by the globalization of China. In order to join the World Trade Organization (WTO), China had to agree to protect property and contract rights, including intellectual

property – China was required to become a member of the World Intellectual Property Organization (WIPO) to enter. It was now under obligations to help protect trademarks and copyrights that had previously had little domestic protection. Domestic parties now realized the potential in getting their own intellectual property protected and began to register their property and work to protect it. I saw a similar effect in the Middle East. In joining WIPO in 2000, the Omani government started enforcing software copyrights. Stores that had previously openly displayed counterfeit software now kept such products under the counter, shown only to those seen as safe customers. New opportunities, however, were open to enforcement officials to demand bribes from these stores. A more positive outcome also resulted – a prominent local photographer in Oman found some of his photographs used in a European company's annual report, without attribution or license. He now was able to demand the company recognize his intellectual property, opening up new opportunities for creative worker to be paid.

### Longer Run Effects

Over the much longer run, the effects change considerably. On a flat earth, attracting FDI, technology, etc. becomes more attractive, and this may result in attempts to reduce corruption against foreigners, shifting corrupt officials' efforts against locals. China has done this successfully to get FDI. This protection is so substantial that it was world news when a Beijing McDonald's, the largest McDonald's restaurant in the world, ran into a municipal order that required it to be demolished (Millman 1996). The Beijing government in 1994 ordered the demolition in order for a Hong Kong developer to build a new shopping plaza. McDonald's resisted for 2 years, and the government finally agreed to pay over $12 M in compensation. McDonald's was able to move 150 m to a new site. The result of these good property rights for foreign investors is that foreign-invested firms would have better secured property and contract rights than did domestic firms.

Domestic investors and firms realized the situation created an opportunity and used it to better protect their own rights. The errors and omissions involved in Chinese international capital flows are quite large, almost US$200B in 2015, according to the World Bank. Apparently, many Chinese investors transfer capital outside China (much seems to pass through Hong Kong and Taiwan) and then act like foreign investors investing in China. Often, they form joint ventures with the real Chinese investor, who now enjoys the better property rights accorded to foreign investors. The scale of this channel may have reached US$100B per year at times.

Accompanying the investment, they often require the investing firm to set up research facilities in Beijing that helps train domestics as well as transfer tech to firms these employees set up or to other Chinese firms. Japanese firms benefitted from the Japanese government requiring foreign investors to license proprietary technology to any Japanese firm that paid nominal royalties.

In Singapore, the better terms offered foreign investors lead to demands by local investors for similar treatment. While not completely realized, this lead to better treatment of these domestic investors, even in an entrepot city such as Singapore, which had been a free trade haven for almost two centuries.

A different channel of globalization operates through international institutions. The investment protection rules of WTO require a greater rule of law, new organizations, and the training of personnel. The resulting better protection of foreign-owned property, like the Chinese situation mentioned above, leads to demands for like treatment for locals. Similarly, SMMs (shared MMs) of what is possible from government result. In more democratic regimes, such as Singapore, these demands get some response, even though the desire to increase FDI is substantial there. On the other hand, in less democratic environments, such as the People's Republic of China, these demands can be ignored for long periods.

## MM Effects

Another channel of globalization effects is through changing the MMs (mental models) of domestic agents. While some Chinese firms that

partner with global MNCs (multinational companies) have been exposed to contracts that involve international legal terms and concepts, most Chinese firms have never experienced a strong legal environment of law and enforcement of their rights, in the socialist legal system China had created, with many legal rights existing on paper only. The greater exposure to such contracts, combined with the existence of WTO adjudication panels required by the acceptance of China into the WTO, has changed the expectations of what the government can do with regard to property and contract rights. This has resulted in revised SMMs (shared MMs) among Chinese businesspeople about the government's role in defining and protecting their rights.

Some Chinese businesspeople have taken the path of mimicking foreign investors mentioned above, but others have started demanding better protection for their rights. These demands have largely been ignored, unless made with guanxi, by politically connected parties. Regardless, seeing others have better protection of property and contract rights changes the expectations people have about what government can do for them. These changing MMs are part of a set of MM changes, involving rising expectations of good government, inclusive markets, freedom of choice, access to information, participation and voice in collective decisions and even accountable government. The 1989 Democracy Movement led by Beijing university students showed some early effects of foreign ideas in China, and the regime attempted to staunch the inflow or expressions of support for them.

But such efforts may be doomed to failure in the face of the Internet's provision of global ideas and information. The government has responded with the Great Firewall of China (Barme and Ye 1997), but such efforts are never completely successful. When I was in Beijing in 2005, I typed democracy into google.cn and found many of the same websites that I had found on google.com in the United States. The major difference was that none of the sites in China were clickable – none were html-enabled. But I was able to copy/paste the address and access these sites. While I am sure the censorship is more complete today, many Chinese know how to utilize VPNs, and anonymous forwarding websites to get around the Great Firewall. Such a wall invites attempts to get around it. Even the Chinese government realizes there is a tradeoff between censorship and the two-way flow information required by a twenty-first century economy. At least, some in the government realize it, even if some of the party's ideologues were to prefer a purely Chinese Internet, walled off completely from global sites.

This tradeoff has also been realized in Singapore, which since 1969 has tried to maintain censorship over ethnic strife and related matters. Over the past 20 years or so, the Singaporean government has been trying to turn the city-state into the leading regional financial center in Southeast Asia. In order to do this, they realize they must compete against Hong Kong, with minimal censorship. The Singapore government does realize that financial markets price information, and the free flow of information is essential to growing their financial markets. Substantial loosening of government censorship has been a major part of their plans to boost their financial markets.

In contrast, China has attempted to promote Shanghai over Hong Kong as a financial center, at least for mainland China, if not a larger stage. But those doing so have met the party ideologues who refuse to release control of public information flows. There has been a back-and-forth between the two groups, even under the new paramount leader, Xi Jinping, who has acquired all the formal power that Chairman Mao ever had. The financial and foreign exchange market turmoil of 2015 and 2016 have resulted in a pulling back from the government's plan to enable the currency to compete with the dollar in international capital flows or reserve holdings. While still announced government policy, many government actions during these years continued to make it less desirable to conduct international transactions in the currency, and China is far from freeing international capital flows much at all. Hong Kong has remained the dominant financial center in China as a result of the ambiguous policy. Globalization has strongly affected trade and logistics in the nation, but contract rights in international capital transactions are severely limited.

Over the longer term, however, the net effect of globalization on public corruption is very likely to be an improvement in economic efficiency and reduction in public corruption. Many of the short-term effects occur due to the new opportunities created by opening the economy. Credible systems are likely not in place to detect and track these new types of corrupt channels. Over the longer term, the changing MMs of private parties demanding a cleaner government, and learning by public bodies to better control the new types of corruption should greatly improve the situation. But in the short term, large examples of corruption may slow or turn the globalization initiatives around, cutting off the benefits from globalization, and reducing its legitimacy in the minds of the public.

## Summary

There are several channels by which globalization can affect corruption. Some operate relatively quickly, as new opportunities, including substantial changes in asset prices, can increase the level of corruption. Over the longer term, if the society continues to open up to the world economy, the learning that occurs changes MMs about corruption, and the expectations society has about what the government should be doing in the economy. In addition, the public sector is likely to learn to better control corruption, both through learning new MMs (including bring in international best practices) and changing the expectations of public officials about their and their colleagues' behavior. Ultimately, the net effect is likely to be positive, improving government practices, but the large new wealth opportunities may stall further globalization, or can lead to a change in the type of corruption, responding to these new opportunities on the part of public officials.

## Introduction

The process of rapid industrialization and globalization has its profound impact upon the socio-economic realities of Bangladesh in the last few decades. Being moved up in the income bracket by the World Bank in the foregoing year and being classified as a country with "lower middle-income" status, the thriving economy of Bangladesh is said to be going through a metamorphosis despite being hit by political instability and natural disasters. In the age of a fast-moving market economy, this economic development is closely interconnected with the domain of technological excellence contributed through the practice and preservation of specialized knowledge created in this regard. This realm of knowledge can only be perceived through their practical implications in increasing economic productivity, employment, and wealth. The specialized set of knowledge resulting from intellectual activity in the form of industrial, scientific, literary, and artistic works gives the creator a distinguished legal right over his creation which is generally known as intellectual property rights (IPRs). It can be loosely defined as the rights given to people over the creations of their minds. They usually give the creator an exclusive right over the use of his/her creations for a certain period of time. As modern economy is based on knowledge and innovation, adequate protection of intellectual property rights (IPRs) plays an important role in stimulating new technological development, artistic expression,

and knowledge dissemination, all of which are vital in ensuring a sustainable economy from the context of a developing country like Bangladesh. It is essential for fostering innovation, dissemination of existing knowledge through providing incentives to the owner of the IPR, and widening the horizon of creating new knowledge as well. Specific protection regime for IPR protection is generally adopted for two main reasons. Firstly, to give statutory recognition to the economic as well as moral rights in favor of the creator over their innovative creations and ensuring the access of common people to such creations. Secondly, for promoting creativity, proper dissemination of knowledge, and ensuring fair trading which shall further the economic as well as social development in the long run (WIPO 2004).

## Conceptual Framework

The governance aspects of intellectual property rights protection and enforcement embraces all the substantive, procedural, institutional, and normative rules and regulations. Present legal framework of Bangladesh on IPR protection traces its origin back to the British-Indian regime and is intrinsically embedded to the colonial legacy of that period. Prevailing IPR protection regime in Bangladesh is supported through well-established legislative, administrative, and judicial initiatives. Legislative initiatives from domestic context also stands in conformity with the global standards laid down in that regard. In that regard, this article shall be initiated through a brief description of the IPR infringement scenario in Bangladesh for the past decades followed by an elaborate discussion on the legislative responses within domestic arena. Leading cases adjudicated by domestic courts have also been accommodated in the subsequent part. Compliance of domestic legal system with the international legal regime in that regard shall be examined side by side. This paper particularly aims at analyzing the legal measures adopted by Bangladesh till to date for affording protection to the IPR holders. In doing so, various national, regional, and international instruments along with leading case decisions delivered by judicial authorities shall be discussed with a view to have a proper insight into the governance mechanism of IPR protection and enforcement in Bangladesh. Following terms has been frequently used in the subsequent chapters of this discussion:

***Property***, in its widest sense, includes all the legal rights of a person whatever description. It is the right to possess, use, and enjoy a determinate thing. Properties are generally classified into two kinds: corporeal and incorporeal. All the movable and immovable properties are classified under the category of corporeal property. Incorporeal property is intangible property, i.e., the creation of mind. Intellectual property, i.e., patents, trademarks, and copyrights falls within the category of incorporeal property.

***Property right*** is defined as the exclusive authority to determine the process and manner of using the resource. It is the liberty or permit to enjoy the benefits of wealth while assuming the costs which those benefits entail. Following the basic definition, intellectual property rights (IPRs) can be defined as the exclusive right (moral and commercial) and protection granted to the creator of an intellectual property (IP).

***Legal regime*** in here particularly refers to all the substantive, procedural, institutional, and normative rules and regulations designed to protect and enforce intellectual property rights within the national boundaries.

## Understanding IPR Infringement: Context Bangladesh

When a person other than the owner of the IPR attempts to exercise the same rights without permission, they infringe the intellectual property rights (IPRs) of the owner. The term "IPR infringement" has been used in a generic sense. Infringement occurs when IPR-protected content is reproduced, transferred, redistributed, used, or sold for commercial purpose without the permission of concerned IPR holder. It is the gross violation of the IPR owner rights over his creative works and inventions which causes financial loss

and for which the infringer has civil and criminal liability. Being a country with promising prospects in economic development, Bangladesh has been facing difficult times in protecting IPR in its dynamic marketplace. Copyright and trademark violation are the most common trend of IPR infringement in Bangladesh. Its economic growth is being vitiated by the increasing level of piracy at the domestic market and for which Bangladesh has been considered as one of the countries having highest rate of piracy in the world. Bangladesh has been given 2.6 on the scale of 7 in IPR protection by the World Economic Forum for the year of 2015–2016 placing in 135th position out of 140 countries (World Economic Forum Global Competitiveness 2015). The music industry of Bangladesh is said to be the worst victim of piracy with a projected yearly loss of $180 million, and it has forced a good number of well-reputed Bengali music recording companies to fold their business for good. Only 5–10% of the total music market consists of legitimate sales (Amin 2012). With 87% software piracy, the first in the Asian Pacific region and the fifth highest in the world sharing the position with Yemen, Bangladesh has been considered a safe haven for software piracy. Software piracy costs about $197 million in Bangladesh as (BSA 2014). Trademark and patent infringement are also on the rise with the access of counterfeit products produced domestically as well as imported from China. Bangladesh has been facing tremendous pressure from the global community in that regard, and it has been stated by the United States Trade Representative naming Bangladesh as one of the countries that "still need to adopt and implement legislation or improve existing measures to combat pirate optical disc production," as it has "not made sufficient progress in this area" (USTR 2009). Moreover, the economic losses due to the rampant infringement practices are enormous and felt throughout the business value chain. In this context, it is essential to have a viable regulatory framework with a view to protect IPR and ensuring a smooth path of economic growth as well. The next chapter discusses the scope of applying available legal mechanisms at domestic level in this regard.

## Legislative Responses Within the Domestic Level

The Constitution of the People's Republic of Bangladesh has recognized and vouched to protect its citizen's right to property within the purview of Article 40 and 42. The concept of property has been expanded by courts to include practically all rights. Thus, patents, licenses, trademarks, and copyrights are held to be properties distinct from physical or material property (Munim 1975). Bangladesh has a quite fascinating history of protecting the interest of the IP rights holders from the very inception of its colonized structure of legal system starting its journey from the late nineteenth century. The present legal system primarily focuses on the trademark-, copyright-, patent-, and design-related issues within the precincts of IPR protection regime (Azam 2008).

### The Penal Code, 1860

The Penal Code of 1860 has founded the very basic provisions relating to the protection and preservation of IP rights. Section 478–489 of the aforesaid Act has particularly envisaged the remedial mechanism available against the infringement of trademark or property mark. The highest punishment for trademark or property mark violation is punished with an imprisonment of maximum 3 years imprisonment or fine or both. The subsequent provisions (Section 489A–489E) also contain the resolution against counterfeiting of currency and bank notes which are exclusive property of the sovereign authority, and a harsh punishment mechanism has been provided with an imprisonment up to 10 years and fine as well.

### The Patent and Designs Act, 1911

The Patent, Designs and Trademark Act of 1883 was the first legislative enactment in the undivided Indian subcontinent, designed exclusively for protecting IP rights at the national level, and it was subsequently replaced by the Patent and Designs Act of 1911 and the Trademark Act of 1940. The Patent and Designs Act of 1911, now prevailing in Bangladesh, has been enacted with an ambition of protecting inventions and designs at the domestic level. This Act redresses the enforcement and

protection regime of IPR from two dimensions, i.e., Part I deals with patent protection and Part II with design protection. Patent protection has been fixed for a period of 16 years under this enactment and violation of which can result into legal proceedings in the form of injunction, delivery of the infringed patented product, or payment of compensation for unlawful profit made from such infringement. Provisions relating to grant of compulsory license for patent rights have also been made available under Section 22–25 of this enactment, but it does not denote any terms and conditions for such license. Moreover, this Act does not contain any inclusive list as to patentable or non-patentable inventions. The second part of the Act provides the mechanism for registering designs featuring shape, configuration, pattern, or ornament applied to any article by any industrial process or means as copyrighted property. The copyright protection period has been prescribed for 5 years and subject to subsequent application before expiration of the prescribed period; it can be extended for a total period of 10 years in two consecutive phases. Bangladesh Law Commission has prepared a draft law in 2001 for improving this almost outdated and age-old enactment with a view to stay in conformity with the rapid technological development, but it has not been presented before the parliament for approval yet.

### The Trademarks Act, 2009

The Trademarks Act, 2009, traces its origin back to the Trademark Act of 1940 and the Merchandise Marks Act of 1899 and exclusively deals with trademark protection and enforcement regime within Bangladesh. Three functions of trademarks may be distinguished as origin function, quality function, and advertising/investment functions (Bently and Shermon 2003). Under the Trademarks Act of 2009, a registered trademark is entitled to seek protection before the law for an initial period of 7 years which can be extended for 10 years from the date of expiration of the original registration or the last renewal of registration and on the basis of application from the holder of the trademark. Both the civil and criminal remedies are available in case of infringement of trademarks under Section 73–91 of this Act in the form of imprisonment, fine, injunction, damages, accounts for profit, and delivery of the infringing labels and marks for destruction and erasure. In addition, it contains provisions relating to passing off, i.e., the misrepresentation of another's trademark, be it registered or unregistered, with a view to create likelihood of confusion or deception. The criminal remedies under this Act can also be availed through the provisions relating to infringement of trade and property marks under the Penal Code of 1860. Moreover, the Customs Act of 1969 has also authorized the customs officials to confiscate and detain any goods, transported into Bangladesh by land, air, or sea, having counterfeit trademark or false trade description (Khondker and Nowshin 2013). The Trademarks Act of 2009 has been supplemented by the Trademarks Rules of 2015 which contemplates the procedural matter in this regard. The liability for ensuring trademarks, patent, and designs protection in Bangladesh lies within the Department of Patens, Designs and Trademarks (DPDT) under the Ministry of Industries.

### The Copyright Act, 2000

The protection regime for copyright and related rights in Bangladesh is centered within the precincts of the Copyright Act, 2000, replacing the Copyright Ordinance of 1962. It has further been amended by the Copyright (Amendment) Act, 2005, and supplemented by the Copyright Rules of 2006. The Copyright Act of 2000 is said to be a comprehensive regulatory mechanism and has been prepared in consonance with the international protection regime concerning copyright and related rights. Copyright registration is not a mandatory option; nevertheless, registration establishes evidence of ownership of copyright in case of infringement under this Act. Computer software is protected by copyright as literary work within the purview of Section 2(46) of this Act. A Copyright Board in quasi-judicial nature shall be established for dealing with copyright issues under the authority of Section 11–12 of this law. The authority of the copyright owner to assign or grant license has been also recognized within the

perimeter of Section 18–23 and 48–54. Section 24–32 of the Act has laid down the term of protection for lifetime as well as 60 years from the beginning of the calendar year next following the year in which the copyright owner dies. The provisions relating to compulsory licensing have been enshrined under Section 50 and 52, whereas Section 72 deals with the processes of fair use, i.e., exceptions to the copyright infringement. Civil, criminal, and administrative remedies are available in case of infringement of copyrighted work which can be enforced by the owner himself, his assignees, or his legal representative. The remedies are available in the form of fine, imprisonment, injunction, compensation, seizure, and delivery of infringing goods and ban on import of infringing goods. This law is administered by the Copyright Office under the authority of the Ministry of Cultural affairs.

### The Information and Communication Technology (ICT) Act, 2006

The Information and Communication Technology (ICT) Act of 2006 has been prepared with a view to provide legal recognition and security of information and communication technology. This legislative enactment has been designed exclusively for facing the evolving challenges in digital and online environment, and it can be construed in tackling piracy and counterfeiting of software which is increasing in staggering number. A good number of provisions enshrined under Section 54–67 of the ICT Act, 2006, entertain the provisions relating to punishment for specific IP-related offenses done in online environment. These offenses may include, but not limited within, software piracy, distribution, and download of copyrighted materials and disclosure of confidential information in online environment, etc. Even though Section 57 of the Act can be applied through constructive interpretation in certain respect, it has been argued by the rights advocacy groups to drop from the enactment due to its flagrant misuse by the government authority. The remedies available under this Act for an act of IPR infringement is imprisonment for a term up to 14 years or fine for a maximum amount of one million taka or both.

### Competition and Geographical Indication Related Laws

The Competition Act of 2012 and the Geographical Indication of Goods Act of 2013 are very new additions in the IPR enforcement regime creating a whole new paradigm of protection in Bangladesh. The Competition Act, 2012, has been prepared with a view to encourage, ensure, and maintain competitive environment in business and to prohibit, control, and eradicate anticompetitive practices within the territorial limit of Bangladesh. Section 15 of the Act imposes prohibition on any anticompetitive agreement, be it direct or indirect, and Section 16 on the abuse of dominant position in the marketplace. Provision for establishing Bangladesh Competition Commission has also been made to tackle any anticompetition design and ensure healthy competition for small and medium entrepreneurs. Being a newborn piece of legislation toward ensuring efficient market system, it would take a little more time to alleviate the shortcomings remaining within this legislative enactment. On the other hand, the Geographical Indication of Goods Act, 2013, has been enacted to protect ownership of products that are traditionally characterized by their geographic origin. Geographical indication (GI) is a name or sign used on certain products to certify that they possess certain qualities because they are made as per traditional methods or enjoy a certain reputation due to its geographical origin. This law came into force in the context of India registering embroidered quilt (*Nakshi Kantha*), *Fazli* mango, and *Jamdani saree* (as *Uppada Jamdani saree*) in the years of 2008 and 2009, respectively, which are historically of Bangladeshi origin. It is pertinent to mention in here that Bangladesh did formulate the Geographical Indications of Goods (registration and protection) Ordinance, 2008, which successfully identified 65 products as its own GI products. The Act has been supplemented by the Geographical Indication of Goods Rules, 2015. The GI of Goods Act is primarily focused on the punishment mechanism which makes it less prevalent with international standards for registering GI products and consequently, losing the international bargaining platform in redressing the interest of Bangladesh.

## Judicial Decisions for IP Rights Protection

In the case of *Sunil Kumar Das v. Canon Kabushiki* (*57 DLR*, *2005*, *pp. 93–100*), it was decided that the well-known international trademarks must be protected even when they are not registered in Bangladesh. This decision has expressed the obligation of Bangladesh to protect international trademark within its territorial limit as one of the contracting parties of the Paris Convention for the Protection of Industrial Property (1883) and the Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS) (1995). The provisions relating to recognizing cross border reputation of trademarks under the Trademarks Act of 2009 and obligation for affording protection on the basis of "National Treatment" Principle under Article 16 of the TRIPS have been expressly recognized in judgment of this case. This has also been reaffirmed in the case of *Major General Amjad Khan Chowdhury* (*Retd.*) *v. Parle Agro Products Ltd. & another* (*17 BLC*, *2012*, *pp. 730–740*) and contemplates that only advertisement and publicity is sufficient to protect the "use" of any well-known international mark in Bangladesh.

In the case of *Bombay Sweets and Company Limited v. Liberty Food Company* (*ADC*, *V-5*, *2008*), it was held that due to long continuous use and advertisement of the mark through various media, the trademark of the appellant "Potato Crackers" has become popular and the mark has acquired distinctiveness as the appellant has been using the trademark "Potato Crackers" since 1986, and by expending a huge amount of money for advertising the mark, it has become the most popular brand in the country and the petitioner being allured by the goodwill and reputation of the respondent-appellant's mark subsequently adopted the words "Potato Chips" as its trademark with the color, design, and getup exactly similar to the appellant's marks. The two trademarks are similar, and therefore registration of the petitioner trademark would be likely to cause confusion and deception, and as such registration of the same would be contrary to the provisions of Section 8 of the Trademarks Act, 2009.

In another case of *Samsonite Corporation v. Moon Light Travels* (*2008*), based upon an allegation private investigation done by the local agent of Samsonite Corporation in Bangladesh, law enforcement agency seized counterfeit "Samsonite" products on a sudden raid and found the allegation true. The local police lodged criminal action under the provisions of the Penal Code, 1860. The infringers surrendered with the local agent, disclaimed the seized goods, and provided adequate compensation including undertaking for not trading with counterfeit product. It was finally disposed of on the basis of an out of the court settlement.

In the case of *Kraft Foods Globe Brands LLC v. Ibn Sina Food Products Pvt. Ltd*, the respondent was debarred, in pursuant of an ad interim injunction issued by the District Court, from using the mark "Tang" which is a globally renowned brand for marketing concentrated powder for preparing fruit drinks and has secured IP protection in Bangladesh since 1987. Later on, Ibn Sina attempted to obtain registration for their trademark with the suffix "Tang," and their application was rejected by the Department of Patents, Designs and Trademarks (DPDT).

In 2010, a legal dispute between the owner of Bijoy software (Bengali computer keyboard layout), Mr. Mustafa Jabbar (proprietor of Ananda Computers) and Omicron Lab, Bangladesh regarding an allegation of unauthorized use of Bijoy layout in open-source Avro Keyboard resulted in lodging of official complaint before the Registrar of Copyrights as to show cause for not taking proper legal measures. Later on, it was disposed of through an amicable settlement between the contesting parties with the intervention of the Bangladesh Computer Council. Consequently, Unijoy keyboard layout from Avro keyboard was removed and Mustafa Jabbar formally withdrew his allegation of copyright violation against the Omicron Lab.

In another case (*National Fans Ltd. v. Haji Md. Firoz and another*, *47 DLR 1995*, *p. 285*), it has been held that no design shall be accounted new or original if it only differs from the earlier design by an immaterial detail, which means that any variation must not be trivial or infinitesimal

which a skilled person might make between the articles for commercial purpose.

## Compliance with the International Protection Regime

The World Intellectual Property Organization (WIPO) is one of the specialized agencies of the United Nations (UN) systems of organization which is intergovernmental in nature. It was established with two main objectives, i.e., to promote the protection of IP worldwide and to ensure administrative cooperation among the IP unions established by the treaties that WIPO administers. Bangladesh has become a member state of WIPO in 1985 through ratifying to the convention establishing the World Intellectual Property Organization. WIPO seeks to protect intellectual property rights through facilitating access to and exchange of information worldwide and simplify practice through international standardization and mutual recognition of rights and duties among nations. Bangladesh is one of the state parties to two significant treaties administered under the authority of the WIPO for protecting and enforcing IP rights, namely, the Berne Convention for the Protection of Literary and Artistic Works of 1886 and the Paris Convention for the Protection of Industrial Property, 1883.

The Berne Convention for the Protection of Literary and Artistic Works is one of oldest conventions dealing with the protection of works and the rights of the authors. It aims at creating a common regime for the protection and enforcement of copyright stretching from national to global context. Bangladesh has ratified to this convention in 1999, and as a contracting party to the convention, it is obliged to adopt necessary measures in consonance with the prevailing legal system to ensure the application of the Treaty (Naznin 2011). The Treaty is based on three basic principles, i.e., Principle of National Treatment, Principle of "Automatic" Protection, and Principle of "Independence" of Protection. In addition, it contains a series of provisions determining the minimum protection to be granted and special provisions relating to leverage to the developing countries. The appendix to the Paris Act of the Convention permits developing countries like Bangladesh to implement nonvoluntary license for translation and reproduction of works in certain cases, in connection with educational activities. The Copyright Act, 2000, and its subsequent amendments in Bangladesh is the outcome of obligation imposed under the Berne Convention. It is pertinent to mention that Bangladesh has also ratified the Universal Copyright Convention in 1975 which has lost its significance due to the prevalence of Berne Convention.

The Paris Convention for the Protection of Industrial Property applies to industrial property in the widest sense, including patents, trademarks, industrial designs, utility models, service marks, trade names, geographical indications, and the repression of unfair competition. Bangladesh ratified the convention in 1991. This international agreement was the first of its kind to help IP rights holders protecting their right beyond national boundary. The substantive provisions of the convention fall into three main categories: national treatment, right of priority, and common rules. Under the authority of this convention, Bangladesh is obliged to grant the same protection to nationals of other contracting states that it grants to its own nationals.

Being a founding member state of the World Trade Organization (WTO), Bangladesh is also obliged to afford protection to IP rights holders envisaged under the Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS). Part III (Article 41–61) of the TRIPS outlines the substantive standards and enforcement provisions for IP rights. As a contracting party, Bangladesh is bound to ensure the enforcement procedures under its own legal system so as to permit effective action against any act of infringement of IP rights covered under this agreement, including expeditious remedies to prevent infringements and remedies which constitute a deterrent to further infringements. Despite the stringent mechanism of IPRs enforcement, Bangladesh is yet lacking in developing strategies to implement the obligations of TRIPS agreement and fulfilling the demand of collective interest. Nevertheless,

Bangladesh as a member of lesser developed countries (LDC) has been given an extension of waiver to avoid applying and enforcing IP rights on pharmaceutical products until 2033. This agreement is also a bitter point of contention and ignited the longstanding division between the north and the south.

The very concept of protection of intellectual property rights has also been embedded in Article 27(2) of the Universal Declaration of Human Rights (UDHR) which states that everyone has the right to the protection of the moral and material interest resulting from any scientific, literary, or artistic production of which he is the author. Bangladesh, being a member of the United Nations, is bound to follow the obligation to protect IP rights declared under the UDHR, 1948.

Bangladesh has been considering joining the Patent Cooperation Treaty (PCT) which aims at establishing patent protection for an invention simultaneously in each a large number of countries by filing an "international" patent application. However local experts have warned that it should not endorse the PCT without detailed study of its impact on pharmaceutical and other knowledge-based industries.

In addition, Bangladesh has also ratified to a handful numbers of regional, bilateral, and transnational treaties and agreements which are relevant for cross border protection of IP rights like the Treaty for the Reciprocal Encouragement and Protection of Investment (1989), Agreement on South Asian Free Trade Area (2006). One of the most significant of such is the Trade and Investment Cooperation Framework Agreement (TICFA) which was signed on November 25, 2013, with the USA. While aiming at fostering bilateral trade and investment for creating jobs, improving technology, and enhancing development, the agreement requires an adequate and effective protection and enforcement of intellectual property rights and adherence to intellectual property rights norms. Although there's shadow of skepticism looming around this agreement about the protection of interest of Bangladesh, it is not bound to comply with any issues which are being exempted by the WTO agreements or any other international convention (Abdin 2013).

## Conclusion

For fostering a culture of knowledge and innovation and in ensuring a sustainable economic growth, it is essential to have viable IP rights protection regime. Regulatory mechanisms available in Bangladesh in this regard lack in coherence and have failed to address the significance of utilizing concerted efforts for protecting IP rights within its territorial limit. With the rapid excellence in the technological sector, the dynamism and ratio of IPR infringement are also on the rise. The modern dimension of infringement has been evolving dramatically where the legal mechanisms available in Bangladesh have failed, due to certain inherent defects, in providing adequate protection for IP rights holders. On the other hand, the real problem of infringement lies within the perception of common people as the ratio of infringement is significantly high at the consumer level in comparison to infringement at commercial scale. The relation between supply and demand must be determined within the very core point of socio-economic dynamism to tackle IPR infringement. The supply line of infringed goods at the industry level can easily be eliminated through culminating more effective tools of protection, but it is required to have frequent awareness building programs for creating a state of responsible consumer behavior which shall seek for IPR protection within itself. From regulatory context, Bangladesh has no specific legislation or is not bound under any international agreement concerning plant variety protection and layout designs of integrated circuits. Being member of LDCs, Bangladesh also gets significant level of leverage from international standard practices for IPR protection which consequently acts as an impediment in enforcing standard practice and procedures into the domestic legislation. The sociopolitical division between the north and the south in issues like capital accumulation, discriminatory matrix of wealth distribution, and excellence in the domain of knowledge, etc. has created a regime of distrust and dilemma among the developing countries like Bangladesh (Watal 2001). Reflecting the nonaligned foreign

policy, Bangladesh tends to keep itself away from regional or transnational obligations of IPR protection. Meager capacity building programs has also led to the absence of expertise in specialized cases like IPR infringement in online and digital environment. Enforcement aspect of IP rights also does matters while making theory into action. Law enforcing agencies and judicial authorities are not well trained for understanding the intricate mechanism of IPR protection and enforcement standards. Hence it is required to increase the organizational capacity and efficiency of the concerned authorities from qualitative as well as quantitative approach for curbing IP-related offenses and minimizing losses incurred by IPR infringement.

# Proposed Fiscal Council for Ghana: An Ex Ante Evaluation

Abdulai Kuyini Mohammed
Department of Political Science,
University of Ghana, Legon, Accra, Ghana

## Synonyms

Financial anchors; Financial performance; Financial watchdog; Fiscal discipline; Fiscal imbalance; Profligacy; Prospective assessment

## Definition

Fiscal councils strictly are akin to independent central banks with a mandate for independent fiscal policy setting. They determine annually the budget balance or the expected level of public debt. In a modest sense, fiscal councils forecast, analyze, and advise on fiscal matters. A fiscal council is supposed to check fiscal indiscipline and profligacy. The question that is interrogated here is: Can a fiscal council achieve these goals in Ghana?

## Introduction

Many developing countries are noted to be operating their budgets persistently on deficit bases. But advanced industrialized countries have also had their share of the deficit bias. The real estate bubble in the USA in 2008 symptomized the onset of fiscal crisis in several developed economies (Calmfors and Wren-Lewis 2011). The fiscal crisis was partly blamed on the economic downturn, but it also smacked of a reemergence of an earlier

phenomenon, that is, the speedy mounting of government debt in most OECD countries in the period between the early 1970s and mid-1990s (Calmfors and Wren-Lewis 2011). In that time the refrain that perfectly described government fiscal policy was "deficit bias" which provided the basis for a rethink of fiscal policy. Discretionary policy was disparaged into disfavor, while fiscal rules crafted to rein in decision-makers were stressed. Across the European Union area, the stability accord established caps on both deficits and debt in addition to medium-term objectives (Calmfors and Wren-Lewis 2011). Many countries including the UK and Sweden introduced national fiscal rules.

The slippages in the implementation of fiscal rules prompted the hunt for novel approaches to sanitize fiscal management. One of the promising mechanisms that have been promoted by both practitioners and academics for doing just that is the creation of autonomous fiscal institutions. According to Calmfors and Wren-Lewis (2011), citing several authors, reputable organizations such as the IMF (Kumar and Ter-Minassian 2007), the OECD (contained in several surveys), the European Central Bank, and the European Commission (2010) have called for the establishment of such institutions. These calls likely inspired European finance ministers to consent to the van Rompuy Task Force to design modalities for fiscal councils which have been mandated to issue independent analysis, evaluations, and forecast in respect of internal member country fiscal policy issues (Wren-Lewis and Calmfors 2011).

In developing countries there is usually a gap between the expected and the actual delivery of public goods and services. The existence of the gap is attributable to several factors. First is the increasing demand for more and better services by citizens. Second is governments' inability to collect the revenues due to them efficiently and effectively. Third is the existence of a large informal sector in some jurisdictions. This makes the identification and proper assessment of the taxable units very difficult resulting in the narrowing of the tax base (Amoah and Loloh 2008). Together these factors compel governments to adopt expansionary fiscal policy either via hiking spending or cutting taxes or both. The resultant is a budget deficit which is financed through internal or external borrowing (Amoah and Loloh 2008). In the African context, for example, additional factors are culpable for the fiscal malaise. These include fiscal indiscipline, the structure of the economy, patronage politics, corruption, and lack of accountability, just to mention a few. Fiscal indiscipline is usually triggered by patronage politics aimed at maintaining incumbent governments in power. This is because it engenders corrupt behavior which is acute in Third World nations.

Many developed countries have adopted fiscal rules and/or fiscal institutions to arrest the deteriorating fiscal positions of their economies. However, developing countries of Africa that are in even precarious fiscal health have not taken measures in the form of fiscal rules and fiscal councils to tackle their worsening fiscal conditions. This is probably due to lack of political will in doing so. It may also be attributable to the public's lack of knowledge and appreciation of the functions of fiscal rules and fiscal institutions and their link to good fiscal performance. Moreover, most countries have only recently reverted to democratic rule after protracted experiments with authoritarian single party and military rule. Such undemocratic political systems are opaque and offer little room for questioning and holding public office holders accountable. Only Kenya and recently South Africa have established fiscal councils as parliamentary budget offices in Africa (Chote 2013). In South Africa the Money Bills Amendment Procedure and Related Matters Act 2009 created the Parliamentary Budget Office to "... provide independent, objective and professional advice and analysis to Parliament on matters related to the budget and other money bills" (Section 15 of the Act as cited in Calitz et al. 2013: 9). These assigned functions of the Parliamentary Budget Office represent essential tasks of fiscal authorities (Calitz et al. 2013).

Ghana has unremittingly been witnessing macroeconomic instability and rising public debt stock due largely to fiscal indiscipline caused by nonobservance of fiscal rules (Assibey 2017).

This concern was echoed by the Minister of Finance and Economic Planning, Mr. Ken Ofori-Atta, when presenting the 2017 and maiden budget of the new Akufo-Addo-led government on the floor of Parliament on Thursday, March 2, 2017. Justifying the establishment of a fiscal council for Ghana, Mr. Ofori-Atta averred that, "Ghana has been faced with significant, long-term slippages and an escalating public debt stock." This he said has led to "a high risk of debt distress, which he attributed to the 'fact that the implementation of fiscal policy lacks a transparent institutional arrangement for providing quality information to the public'" (Ofori Atta 2017). He therefore signaled government's intention to establish a fiscal council to be responsible for setting up medium-term fiscal policy anchors to guide fiscal policy as well as monitor compliance (Ofori Atta 2017).

The aim of this chapter is to assess a priori the promises and potential challenges of the proposed fiscal council in Ghana in executing its mandate efficiently and effectively. Specifically, the chapter poses and addresses the following questions: (1) Does Ghana need a fiscal council? (2) What functions will the fiscal council perform? (3) How independent will the fiscal council be? (4) How effective will the fiscal council be in the discharge of its mandate? (5) What measures will be put in place to deal with potential challenges that might confront the fiscal council in the discharge of its mandate?

The chapter is structured such that after the introduction the second section reviews literature on deficit bias, while the third section examines the emergence of fiscal councils. The fourth section looks at trends in Ghana's fiscal outlook. The fifth section discusses the prospects and potential challenges of establishing a fiscal council in Ghana. The final section is devoted to discussion and conclusion.

## The Trend of Deficit Bias in Fiscal Management

Beginning in the early 1970s, fiscal policy implementation has been oriented toward a strong budget deficit bias. Examining a panel of 22 developed countries, Beetsma and Debrun (2016) discovered, based on long fiscal time series data, that the frequency of general government deficits increased significantly over time and across jurisdictions. During the 1960s around half of the countries in their study witnessed largely balanced or in-surplus budget positions more than half of the time. Only New Zealand and Norway had attained such performance between 1990 and 1999. The median number of deficit years per decade was between 7 and 9 years for all post-1970 sub-periods except the pre-global financial crisis period (2000–2008) (Beetsma and Debrun 2016: 4). This occurred when several nations enjoyed extravagant hikes in revenues from asset price booms and relatively strong economic growth. The fiscal ramifications of the global financial crisis currently are evident: 13 out of the 22 states in Beetsma and Debrun's study have experienced or are expected to witness a deficit every single year between 2009 and 2017 (Beetsma and Debrun 2016). In the USA and Europe, spending increased markedly over revenues in the 1970s and 1980s. During the period in the USA, fiscal policy was obviously countercyclical because downswings were usually followed by a dramatic upsurge in expenditure (Wyplosz 2005). The trend was halted by the Reagan administration which managed to arrest the growing debt. However, the deficit reemerged in the 1990s when the federal government introduced tax cuts which were not offset by spending reductions. In the 1980s in Europe, public expenditure hiked every year which was unmatched by tax changes. An important element of the rise, which was quite formidable to reverse, was government expenditure on welfare transfers (Wyplosz 2005).

Fiscal deficits are usually blamed on adverse domestic and external shocks; but their sustained spell in several jurisdictions for so long and the continued public debt accumulation that accompanies the trend imply that some other important forces are responsible. For example, unparalleled in the postwar period, public debt has peaked to heights never witnessed among the G7 economies (Beetsma and Debrun 2016). Extant literature

indicates that "weak public financial management and distorted political incentives are the main culprits for deficit biases" (Beetsma and Debrun 2016: 4). Political distortions comprise the propensity of policymakers to concentrate on the ramifications of their discretionary actions in the short term, giving scant consideration to the medium and the long term. Moreover, distributive conflicts involve the "common pool" problem, that is, the basic propensity for any given political constituency to use the available resources for their exclusive benefit without regard to the overall budgetary position (Beetsma and Debrun 2016; Calmfors 2015). In addition, the deficit bias can also reflect time inconsistency. For instance, it can be difficult for governments to credibly commit to saving revenue windfalls in good times because of strong spending pressures that inevitably arise when abundant resources are available (Calmfors 2015).

The fiscal outlook in Africa is even worse than the picture in the developed countries. During the past decade, Africa's debt sustainability has improved, and its debt-to-GDP today is lower than in decades, even though it has been rising in some countries (e.g., Cape Verde, Ghana) (Ncube and Brixiova 2015). Nevertheless, the global financial crisis has left some countries with looming fiscal challenges and deteriorating public debt sustainability. African countries – which entered the global financial crisis with overall low debt levels, adequate foreign-exchange reserves, and moderate inflation – experienced the crisis shock mostly through cuts in external demand and liquidity shortages. Where policy buffers allowed, the governments adopted countercyclical responses to the crisis, usually in the form of increased capital outlays and/or monetary easing (Kasekende et al. 2010). This contrasts with the experience of developed countries where the global financial crisis of 2008–2009 led to a major private sector de-leveraging and public debt accumulation (Ncube and Brixiova 2015).

In general, the global financial crisis has led to African countries' deteriorated fiscal (and current account) balances. Sometime after the crisis, fiscal balances were pitched lower than before the crisis in about two-thirds of the countries. Although the size of Africa's fiscal decline is reminiscent of other developing and emerging market economies (EMEs), its causes are dissimilar. In advanced countries the increased deficits were driven virtually by stimulus policies, while in Africa external shocks contributed significantly (Ncube and Brixiova 2015: 557).

In Africa, fiscal balances and public debt ratios have shown remarkable dissimilarities and variations even during such a short time period as the aftermath of the global financial crisis. Overall, however, countries with sturdier fiscal positions at the beginning of the crisis employed more decisive countercyclical measures and experienced larger deterioration of their fiscal balances (Ncube and Brixiova 2015: 558). For example, following the posting of large fiscal surpluses in the run-up to the crisis, oil exporters recorded declining fiscal balances decidedly in 2009. Despite this, most countries at least partly recovered with favorable oil prices, and the group recorded a small surplus in 2012 (Ncube and Brixiova 2015). Notwithstanding the improvement, oil exporters need to tackle the underlying structural weaknesses and reduce their dependence on volatile commodity revenues. The fiscal deterioration was severer in frontier market – countries that have issued international sovereign bonds or have sovereign credit rating such as Ghana. These countries recorded the largest deterioration of their fiscal balances, and public debt built up as a result of the countercyclical measures adopted in 2009 and beyond. Several of these countries have upheld expansionary policies. For example, Egypt continues to post deficits (in terms of GDP) near or in double digits, reflecting high subsidies and public sector wages. Their access to financing has allowed for the maintenance of budget deficits which were financed through sovereign bond issues, as Namibia and Zambia did externally and Kenya locally (Ncube and Brixiova 2015). A disproportionately large number of other nations, particularly some of the fragile countries, could not employ countercyclical measures during the crisis, due to limited fiscal policy buffers and access to borrowing. Their fiscal

balances have thus deteriorated less than those of the frontier markets. These countries have also posted current account deficits in double digits, raising concerns about vulnerability to external shocks (Ncube and Brixiova 2015).

To rein in the deficit, most developed countries have established fiscal rules and fiscal councils and equipped with the requisite resources, personnel, and independence to discharge their mandate effectively. The question that arises for interrogation in respect to a developing context like Ghana is: Will the fiscal council when established be given adequate resources, requisite personnel, and independence to do its work?

## The Advent of Fiscal Councils

Coming on the heels of the early upsurge of fiscal rule implementation, many jurisdictions attempted to further boost fiscal credibility via improved designed rules and by setting up fiscal councils to enhance openness, transparency and answerability (Beetsma and Debrun 2016). However, the advent of fiscal councils has been much slower and only actually took off intensely subsequent to the global financial crisis. Independent bodies with responsibility for strengthening the institutional dimensions of the budgetary process, such as enforcing fiscal rules, extending the budget forecast, and creating new fiscal institutions, are certainly not novel (Calmfors 2015; Franek 2015). Countries that have had such institutions in place include the Netherlands (the Central Planning Bureau from 1945), Denmark (the Economic Council from 1962), Germany (the Council of Economic Experts from 1963), and the USA (the Congressional Budget Office from 1974) (Calmfors 2015: 11). These pioneers were followed by Belgium and Austria that created such bodies in 1989 and 2002, respectively. Late comers in the establishment of fiscal institutions include Sweden (2002), Canada (2008), Hungary (2009), Slovenia (2009), and the UK (2010). Calmfors (2015) claims the research by OECD (2014) which indicates that currently there is appetite for the establishment of fiscal institutions.

When the proposals for establishing autonomous fiscal watchdogs were first mooted, it was thought that they should resemble independent central banks. Since governments have delegated monetary policy to central banks, it was surmised that likewise fiscal policy could be relinquished to autonomous fiscal entities as a way of blunting the inclination toward deficit bias. Unfortunately, the view that fiscal policy could be delegated to autonomous institutions never materialized (Calmfors 2015). The reason for this could probably be the idea that fiscal decisions are inherently much more redistributive and for that matter more political than monetary decisions. This is so because government must indicate precisely which taxes or public expenditures to alter (Calmfors 2015; Wyplosz 2005). This forced the theoretical discourses to reorient toward autonomous fiscal authorities devoid of decision-making power. Their role was to be circumscribed to a "watchdog" and a mandate to inform and warn elected officers and citizens of fiscal risks. In this debased capacity, the objective is now to influence policy either directly via input into the decision-making process or indirectly by means of analysis and participation in public deliberations (Calmfors 2015: 12).

A fiscal authority with an oversight mandate could arrest many of the factors that bring about deficit bias in several important respects: furnish information to both electorates and politicians; decrease the informational gaps between government and voters; eliminate the chances for government to apply unrealistic growth forecast to rationalize deficits; mitigate common pool problems via precise costing of spending and tax proposals; increase reputational cost for governments inclined toward deficit bias; identify and warn against unsustainable booms that when ending can cause fiscal crunches; serve as a tool for objective macroeconomic forecasts; focus on long-term analysis of budget balance; and make recommendations for the execution of fiscal policy (Calmfors 2015: 12; Franek 2015).

Despite the theoretical and practical benefits of fiscal institutions, critics have attacked their establishment from multiple angles. One objection to the setting up of fiscal councils is that

proponents simply assume their effectiveness. They ignore the exigencies that might work against their efficacy in practice. They assume mainly that institutions are fashioned as incentive structures for policymakers and their credibility is often taken as given (McCallum 1995 cited in Beetsma and Debrun 2016). Advocates retort that institutions are characterized by the high cost of changing them; hence they are essentially more credible than discretionary polices (Beetsma and Debrun 2016). Posen's (1995) criticism of fiscal institutions relates to the likely incongruence of their judgments with the ethos of the people in a democracy. He insists that in a democracy institutions can only endure if they match profounder social inclinations or permanent features of the political system (Posen 1995 cited in Beetsma and Debrun 2016). The inference from this is that institutions in isolation do not change fundamental motivations. So if fiscal institutions are to be effective, then their judgments should coincide with the deeper preferences of society – neither the former nor the latter can stand alone. Posen strikes an analogy here when he clinches that, "both central bank independence and a coalition in society committed to protecting that independence are necessary to achieve the low inflation heretofore ascribed to central bank independence, either alone is insufficient" (Posen 1995: 271 cited in Beetsma and Debrun 2016).

The question that arises from the above discussion on the strengths and weaknesses of fiscal institutions is: Will such institutions work in a developing context? This question is asked because of the characteristics of the Third World which are markedly different from those in the developed countries where such institutions originated. These characteristically different Third World conditions include the "Big Man" cult; disrespect for constitutions and constitutionalism; lack or weak institutional conventions; lack of political will and commitment; and the culture of reciprocity and deference. For example, in terms of the Big Man cult, historically the executive has been the most powerful institution of governance from the pre-colonial chieftaincy through the colonial era, one-party rule, and military dictatorships in the postindependence period and up to the current democratic dispensation. The executive has been so powerful to the extent that it has culminated in a phenomenon known as the "Big Man" – a single man so powerful that the whole governance system seems to depend on his capabilities and whims and caprices (Mohiddin 2008). Consequently, the other branches of government and other countervailing centers of power are powerless to check the executive and to hold it to account.

## Prospects and Challenges of Establishing a Fiscal Council in Ghana

This section is devoted to the examination of the possibilities and difficulties that are likely to arise if Government of Ghana makes good its promise to establish a fiscal council for the country. Specifically, the remit here is to determine the need for a fiscal council in Ghana, the functions the fiscal council will be assigned, chances for autonomy of the fiscal council from political interference, and measures that will be taken to deal with challenges that might confront the fiscal council.

## The Need for a Fiscal Council in Ghana

There are at least five reasons why a fiscal council and/or fiscal rules are needed in Ghana. These are the escalating budget deficits; inaccurate fiscal forecasts; opaque account of the benefit of expenditure programs or the risks involved; the technical language of budgets; and poor fiscal policy decisions arising from the limitation of government payments to available revenues.

In the Ghanaian context, the debate between the positive versus negative impact of budget deficits on economic growth has been longstanding, particularly among politicians and policymakers. Since the first republic where the socialist agenda was adopted, budget deficits have been a common feature of Ghana's economic management (Larbi 2012). The decade prior to the Economic Recovery Program/Structural Adjustment Program (ERP/SAP) saw momentous economic deterioration which culminated in negative

real growth, triple-digit inflation, and large fiscal deficits. In particular, the deficits averaged over 10% of GDP in the period, reached 13% of GDP in 1976. In 1983, however, it declined progressively to settle at 3% (Amoah and Loloh 2008: 7). The factors that were responsible for the budget deficit included trade shocks and a decline in international transactions, reduction in economic activity, inadequacies and errors in domestic policy, and serious misalignment of the real exchange rate followed by the emergence of parallel markets. Together with an overstretched public sector activity, these factors adversely affected government revenues (Amoah and Loloh 2008). The main fiscal objective of the ERP and the SAPs was to reduce the budget deficits in order to control inflation and halt crowding out of the private sector through among others, revenue growth, broadening the base of the economy, and eliminating waste through privatization of public enterprises. These efforts produced the desired results as the deficit declined to the extent of revenue outstripping expenditure from mid-1980s to 1991.

An expenditure expansion occurred in 1992 and was caused by the democratization process which was climaxed with the general elections in November of that year. The expenditure growth made the budget deficit to rear its ugly head again climbing to 4.8% of GDP in 1992. Nevertheless, there was a progressive decline in the quantum of the deficit which translated into a budget surplus for fiscal years 1994 and 1995 of 2.3% and 0.9% of GDP, respectively (Amoah and Loloh 2008). The large deficits reappeared in 1996 (another election year) after improving from the 1992 level. In 2000 a reminiscent trend was also recorded, which was another election year. The fiscal austerity that was instituted following the assumption of power of a new government in 2001 led to a considerable decrease in the budget deficit from a high of 8.6% of GDP in 2000 to a low of 1.96% of GDP in 2005 (Amoah and Loloh 2008). However, fiscal deterioration which usually characterizes election cycles was not witnessed in 2004 as revenues earned outstripped expenditure incurred. This good fiscal health turned into a malaise by 2007 for a number of reasons: the energy crisis which began in 2006; expenditures associated with "Ghana at 50" celebrations; the hosting of the AU summit in Accra in 2000; and the hosting of the 2008 Africa Cup of Nations. Together expenditure on these events culminated in a fiscal deficit of 8.1% of GDP in 2007 (Amoah and Loloh 2008).

The extraordinary upsurge in the budget deficit since 2012 has rekindled and intensified the debate about the implications of fiscal deficit for economic growth and the development of the country. Ghana's deficit increased from 4.3% in 2011 to 11.8% in 2012 before plummeting to 6.3% in 2015, which is still considered high when juxtaposed with past statistics (Bank of Ghana 2013). The hike in the deficit has contributed to an increase in the country's gross public debt as a ratio of GDP, from 40% in 2011 to 72.6% at the end of November, 2015 (African Development Bank, Organization for Economic Cooperation and Development & United Nations Development Program 2015).

Extant literature identifies four broad means through which a country can finance its budget deficit: (i) it can run down its cash reserves; (ii) it can sell some of its assets like properties, shares in companies, and even enterprises; (iii) it can print more currency, which in turn will increases money supply and thus trigger inflation; and (iv) it can also borrow from central and/or deposit money banks (DMBs) or from the general public internally and externally (Amoah and Loloh 2008). There are economic implications associated with the adoption of each of the approaches to plugging the deficit. For example, while external borrowing upsurges a country's external debt with attendant high interest payments, domestic borrowing does not only increase domestic debt profile, but it also impacts inflation and interest rates and undermines the long-run growth path of the economy (Amoah and Loloh 2008).

The Government of Ghana over the years has employed to varying degrees these different instruments. The principal instrument, however, for financing the budget deficit has been borrowing from both the banking and the private sector (Domestic sources) which averaged about 70%

of the overall deficit financing. Domestic financing of the budget deficit in 1999 was 83% of the overall financing or 5.4% of GDP, out of which 93% or 5.1% of GDP was sourced from the banking sector, of which 21% or 1.1% of GDP came from the Bank of Ghana (Amoah and Loloh 2008). It is important to state that by 2000, domestic financing of the deficit jumped to 102% of the overall financing or 8.8% of GDP; the banking sector's share was 80% or 7% of GDP, and the Bank of Ghana's share of the banking sector was 94% or 6.6% of GDP (Amoah and Loloh 2008). This disproportionately large share of Central Bank financing of the budget deficit is in line with the high inflation and the considerable macroeconomic instability witnessed between 1999 and 2000. During the last 7 years, the composition of the deficit financing has witnessed a complete change. In 2001, government succeeded in traditional debt rescheduling (exceptional financing) of up to 22.3% of the overall deficit. And since 2003, exceptional financing mainly related debt relief made up a big fraction of the overall deficit financing, averaging over 40% between 2003 and 2007 (Amoah and Loloh 2008). The West African Monetary Zone (WAMZ) criterion stipulates that respective central banks cannot finance the budget deficit of more than 10% of the previous year's revenue. Likewise, the Bank of Ghana's Act of 2002 restricts the bank's financing of government (Amoah and Loloh 2008). These restrictions together with other existing financial and legal instruments are intended to force government to discipline expenditure and plug the budget deficit. Successive governments have, however, flouted these controls with the result that the deficit continues to grow. For example, the deficit increased from 6.3% in 2015 to 8.7% in 2016 (ISSER 2017). This means Ghana probably needs binding numerical limits on primary balances, expenditures, and deficits. It also needs fiscal institutions either to advice on or compel adherence to fiscal targets and monitor fiscal performance.

Another reason why a fiscal council is warranted in Ghana is that the government and its treasury's fiscal forecasts are rarely accurate. For example, fiscal targets, characteristic of virtually all election years, were not attained in 2016. In cash terms the overall target was set at a deficit of 5% of GDP, but what was actually achieved was 8.7% – 3.73 percentage points difference. In regard to commitment, the target set was a deficit of 3.7% of GDP, but the figure that was actually obtained was 10.3% (6.6 percentage points difference) (ISSER 2017). Despite the fact that both expenditure and revenue accounted for missing the targets, the contribution of expenditures was far greater. Compare the share of GHS7.1 billion of the former to GHS4.2 billion for the latter. The expenditure target was 26.4% of GDP, but what was actually achieved was 30.3% of GDP. The projection for revenue and grants was 22.7% of GDP, but the actual figure obtained was 20% of GDP (ISSER 2017).

Equally, the projections for 2017 are interesting but ambitious in many important respects. On the upside there have been generous tax abolitions and cuts. While these tax incentives may spur production and growth, they may reduce the revenue yield and create a mismatch between income and expenditure. This gap could only be bridged through deficit financing. Moreover, there is the likelihood that tax cuts are intended to garner patronage and popularity to the new government (ISSER 2017). The other issue relates to whether the government can remain disciplined, fiscally. This is because there is a historical record of profligacy in government expenditure in Ghana's 60 years of nationhood.

Ghana relies on historical trends to make projections. This largely depends on the exchange rate volatility as a key parameter, among other things. Budgets are normally prepared against certain expenditures, which government collates from the various institutions to make revenue projections. Such a system makes it difficult to forecast since it lacks scientific verification (ISSER 2017).

The experiences of both industrialized and developing countries show that governments are generally engaged in bending of their own laws. The fiscal impropriety embraces substantial window dressing of budget estimates of revenues and expenditures, avoidance of credit limits through an accumulation of unpaid bills, transfer of amounts toward the end of the year to deposit

accounts to avoid lapse of funds, and manipulation of performance data and associated means (Shende and Bennett 2004). Window dressing involves projection of rosy scenarios of economic growth and policy measures yet to be formulated. A susceptible public may not always know what the government is doing. While these practices are sought to be reduced in some jurisdictions via a review of the estimates by the audit agency or through an assessment by credit rating agencies, it is important to state that these attempts are, generally, circumscribed (Shende and Bennett 2004). For now, in many jurisdictions the budget mirrors creative accounting approaches that successfully disguise the actuality. These practices, to be frank, undermine financial accountability.

In the Ghanaian context, budget information on nonfinancial assets and liabilities including contingent ones is either scanty or nonexistent. Instead, a good deal of detailed information on small operations may be provided, while accounts are generally opaque in important areas such as defense and extremely brief on the benefits of expenditure programs or the risks involved. The budgets tend to be very silent on risk management, that is, the changes in strategy in the event of changes in the underlying assumptions. For example, the new Akufo-Addo-led government has repeatedly criticized the huge outlays (largely financed from borrowing and tax hikes) of its predecessor Mahama administration. In charting a new direction, the new government has either scrapped or reduced several taxes which its predecessor introduced, labeling them as nuisance taxes (Ofori Atta 2017). In so doing it has over concentrated on the benefits of the abolition of the so-called nuisance taxes, but it has been silent on its costs. Also, budgets and accounts in government speak a technical language that tends to be extremely difficult for the public to comprehend. The classification of government activities may conceal more than it reveals.

The applications of payment arrangement under which government expenditures are circumscribed by available revenues have created grave problems in the pursuit of apt fiscal policy. A fiscal policy suggests a balance between fiscal aspects and service delivery. In cash limited approaches, budgeting becomes a backdoor exercise in that the budget that is implemented may not be the one that is approved by the legislature but the one that is determined by cash inflows (Shende and Bennett 2004: 4). In a setting like that, service delivery becomes incidental, and the very approach that is aimed at boosting investor confidence eventually undercuts public trust in government and weakens legislative accountability. This was exactly the situation during President Mills' regime. In attempt to achieve macroeconomic stability, the government barred the commencement of new projects and programs, froze public sector employment, and instituted fiscal austerity. These measures succeeded in reducing the double digit inflation to single digits and stabilized the foreign exchange rate as well as restored investor confidence (ISSER 2017). But the downside was that public service delivery was sacrificed as maintaining existing service levels became quite formidable. This reinforced the popular perception that, in a crisis, the first activity that is protected is not service delivery, but payment of wages to government employees (Shende and Bennett 2004).

## Functions of Proposed Fiscal Councils

As Wren-Lewis and Calmfors (2011: 15) indicate, the likely functions of a fiscal council are at least seven. These include (1) ex post evaluation of whether fiscal policy has met its targets in the past; (2) ex ante evaluation of whether fiscal policy is likely to meet its targets in the future; (3) analysis of the long-term sustainability of fiscal policy; (4) analysis of fiscal transparency; (5) costing of individual government policy initiatives; (6) macroeconomic forecasting; and (7) normative recommendation on fiscal policy.

In terms of the core functions of a fiscal council, the first four are representative. Fiscal targets are typically predicated on cyclical dynamics which implies myriad and varied interpretations will be obtained in respect to whether or not the targets have been attained. This increases the opportunity for political manipulation (Calmfors and Wren-Lewis 2011). It is in such a

scenario that the role of a fiscal watchdog becomes crucial in verifying past fiscal behavior. The Ghanaian economy in the postindependence period from 1957 to date has been witnessing economic swings or business cycles – recessions and recoveries (ISSER 2017). The business cycle is the cyclical changes of the economy from periods of boom to bust. It encompasses an expansion in economic activity (gauged by indicators like rises in output, employment, and profits) accompanied by a reduction (downward turn in economic activity measured by indicators such as falling production, unemployment, business losses, and bankruptcies) (ISSER 2017). In line with Calmfors and Wren-Lewis (2011), there have been different interpretations over the years as to whether governments have achieved their targets. The window for multiple interpretations of government's fiscal performance was opened following the democratization process in the late 1990s when the hitherto gagged civil society organizations and think tanks had a liberalized environment established in which they could make input to public policy making. Think tanks like the Center for Economic Policy Analysis (CEPA), Institute of Economic Affairs (IEA), Institute for Democratic Governance (IDEG), Center for Democratic Development (CDD), and IMANI Ghana have now been able to speak boldly on national issues and have on occasions criticized government policies. For example, in a recent report, IMANI Ghana made an assessment of the immediate past National Democratic Congress (NDC) government's campaign promises against its achievement (IMANI Ghana 2016). Its findings among others included a mismatch between the government's economic fiscal fundamentals and targets and achievements. This was, however, disputed by the government. Likewise, the Institute for Fiscal Studies (IFS) claims that the outgoing NDC government's medium-term adjustments were not ambitious enough to spur robust economic growth and improve revenue mobilization (Institute for Fiscal Studies 2015). So having a fiscal council will enable an independent assessment to be made of government's past fiscal targets. Because there is risk of a fiscal authority criticizing government, later this should strengthen the ex ante incentives for the government to exercise fiscal discipline. These incentives are much more profound if a fiscal watchdog takes up the task of ex ante evaluation of whether fiscal policy is likely to meet its objectives in the future (Calmfors and Wren-Lewis 2011).

Engaging in long-term fiscal analysis should also be an important remit of a fiscal council. This is because scant consideration of future consequences is at the crux of the deficit bias problem (Calmfors and Wren-Lewis 2011). Yet the proposed fiscal council for Ghana will be confined to making only medium-term projections. This was made clear by the Minister of Finance, Mr. Ken Ofori-Atta, when presenting the 2017 budget on the floor of Parliament on Thursday, March 2, 2017. He said that the "fiscal council shall be responsible for setting up medium-term fiscal policy anchors to guide fiscal policy as well as monitor compliance."

Medium-term fiscal projections should feed long-term objectives. Medium-term targets can be viewed as intermediate goals fashioned to attain more fundamental, high-level objectives. These objectives could include social efficiency (giving an argument for tax flattening), precautionary savings to take care of future contingencies or intergenerational equity (Auerbach 2008). So if Ghana wants the proposed council to do a good job, it should also assign it with the task of projecting long-term fiscal objectives.

Another consideration relates to whether the proposed fiscal council should engage in macroeconomic forecasts. There is one important advantage in conducting macroeconomic forecasts: over confident government forecasts have usually been employed to disguise extravagant fiscal policy (Jonung and Larch 2006). The downside is that the resources required for such forecast can be colossal. Such analyses may also come at the expense of other council activities. Furthermore, forecasts are inaccurate most of the time – sometimes very wrong. Thus, if the fiscal council that is proposed for Ghana is assigned the task of macroeconomic forecasting, this could undermine its credibility and make it quite formidable to accomplish other assigned functions. Wren-Lewis

(2010) agrees when he asserts that engaging in macroeconomic forecasts could weaken a council's credibility and make it harder to fulfill other tasks. They propose another option, that is, that, the fiscal council only monitors the governments' forecasts.

According to the Finance Minister, the fiscal council will "set up medium-term fiscal policy anchors to guide fiscal policy, and monitor compliance with fiscal policy rules" (Ofori Atta 2017). But a fiscal council can do more than what the Finance Minister has suggested. It could in addition do either positive or normative analysis. At the minimum, positive analysis can take the form of setting out the ramifications of the government's policy only. A more advanced positive analysis will be to outline the effects of alternative policies as well. Moreover, a fiscal council could give alright policy recommendations. The pursuit of these tasks will entail hard compromises. In one vein, normative recommendations could compromise the positive analyses. The other side is that those who make use of the council's reports may find it difficult to determine how strictly positive analysis should be transformed into policy conclusions, hence debasing the effect of the fiscal watchdog's analysis on real-world policy (Debrun et al. 2009).

## Independence of the Council

Independence of fiscal councils in discharging their mandate efficiently and effectively has been mentioned often times in the literature. This is grounded in the belief that deficit bias stems from distortions in the political system which a council is established to resolve (Calmfors and Wren-Lewis 2011). Factors that guarantee a fiscal council's independence can be sketched. These are (1) budgetary independence, (2) accountability, (3) establishment of international standards, (4) the choice of a principal for a fiscal council, (5) the composition of a fiscal council, and (6) the legal status of a fiscal council (Franek 2015; Wyplosz 2005).

To ensure independence from political interference, a fiscal council should be guaranteed a stream flow of funds to run its activities. Central banks have no problem since they have financial autonomy (Calmfors and Wren-Lewis 2011). Likewise, a fiscal council should possess a long-term budget to forestall the likelihood of governments attempting to interfere or influence its activities via controlling the size of budget allocations. The uncertainty of a long-term budget for the proposed fiscal council for Ghana looms large. This is because the experience of the resource-strapped constitutional bodies like the National Media Commission (NMC), National Commission on Civic Education (NCCE), and Commission on Human Rights and Administrative Justice (CHRAJ) is illuminating. For example, the NCCE is mandated to provide civic education across the country on all aspects of national life including healthy living, civil liberties, and civic responsibilities as well as voter education, just to mention a few. But its offices are as yet not even established in many districts across the country and it has skeleton and often less skilled staff in addition to poor logistics supply. The mandate of NCCE is huge, but its appropriation in the annual budget is extremely limited. The NCCE has witnessed recurrent discrepancies between the approved budget and the actual funds received. For example, in 2006 a budget of $35,304 was approved, but at the end of the year, the Ministry of Finance released $31,102 resulting in a shortfall of $4,202. For the 2011 fiscal year, a budget of $40,976 was approved; however, only ¢36,231 was released (Debrah et al. 2014). A CDD's (2005) study found huge divergences between budget releases and expenditures of governance institutions. So without political commitment, a fiscal governance institution like the proposed fiscal council will also suffer funding constraints just as the NCCE and the other constitutional bodies.

A second issue in relation to the independence of a fiscal institution is accountability. This seems ironical, yet a fiscal watchdog which is not answerable in the short run may sacrifice its independence into the long term (Calmfors and Wren-Lewis 2011). This is explained by the fact that in the discharge of its responsibilities on a day-to-day basis, a fiscal council may run into a collusion path with the government which may attempt to

curtail its independence or redesign its remit. One way of insulation against such obtrusion is to have regular evaluations of the quality of the work of the council. An appraisal like that could take the form of peer reviews which could be conducted by councils from other jurisdictions or by a more formalized international network of councils or by international organizations like the IMF and the OECD (Calmfors and Wren-Lewis 2011). In a developing country, context such as Ghana's rating by an international body like the IMF may be more credible and acceptable because it already conducts assessments of government's fiscal management of the country which is a beneficiary of its loans.

A third strategy for ensuring the independence of a fiscal council is to establish international standards. This is already a reality in the European Union (EU) where finance ministers have already reached a consensus in the van Rompuy Task Force to develop (non-binding) recommendations on the set up of national fiscal councils (Calmfors and Wren-Lewis 2011). This measure represents an option for making it politically expensive for governments to undermine the independence of fiscal councils. In the Ghanaian context, this appears to be a gloomy proposition because the African Union's underdevelopment in terms of monetary, fiscal, and legal integration makes the continental body incapable of setting and administering such standards. Recourse to the EU will be inappropriate because of lack of jurisdiction.

Another way of guaranteeing the independence of a fiscal council is the assignment of a principal for it. The council could formally be designated as an agency under the executive as in Sweden, Denmark, and Slovenia. Alternatively it could be an entity under the legislature as in Canada, Hungary, and the USA (Calmfors and Wren-Lewis 2011). As an entity under the legislature, the council can achieve independence from the government because it will be difficult for the executive to interfere in the work of the council. However, the downside is that the legislature can likewise interfere in the work of the council since the political cost in doing so might be smaller for less well-known parliamentarians than for government ministers (Calmfors and Wren-Lewis 2011: 18). In the Ghanaian scenario, another problem that will be encountered for subsuming the fiscal council under the legislature is that Parliament has traditionally been a majoritarian one. Moreover, under the fourth republican constitution, the executive and the legislature are fused. Together these two factors make the legislature dance to the tune of the executive. In other words, in fused and majoritarian parliaments like Ghana's, the executive controls the legislature and for that matter will control the fiscal council.

The makeup of a fiscal council can also affect its independence. The tenure of office of council members should enable the council to operate independently from the election calendar (Franek 2015). The likely constituencies from which members of a fiscal council can be drawn include (1) academic researchers, (2) public finance experts from the public administration structure, (3) analysts from the financial sector, and (4) ex-politicians (Franek 2015).

Members of academia constitute the dominant group especially in Denmark, Germany, Hungary, and Sweden. In these countries the council is made up of only academics or a clear majority of academics (Calmfors and Wren-Lewis 2011). The reason for their dominance is that their analyses are more likely to be objective and free from political contamination than most other groups (Chote 2013). A high reputational cost would be incurred by an academic if their analyses were politically tainted rather than being scientifically objective. Nevertheless, academics do not possess the expert knowledge required to furnish detailed assessments of budget bills. This is also the rationale for including public finance experts with a background in government administration. Yet career public servants are more worried than academics about future career prospects in government establishment. Another option is enlisting analysts from the financial sector. The last but not the least alternative is to include a small number of well-known ex-politicians in order to ensure the legitimacy of the council and hence its independence.

In the Ghanaian context, all of the above categories of people are available. For example,

many academics with expertise in economics and finance that are trained locally and internationally are in adequate supply. The bureaucracy with diverse expertise including economics and finance has proven indispensable in public policy development, implementation, and evaluation since independence in 1957 (Asante 2005). There is now a fledgling financial sector in Ghana made up of a portfolio of commercial banks, financial institutions, and a stock exchange market. All of these have nurtured and retained dedicated and experienced staff in the economic and financial fields. The proposed fiscal council can therefore draw members from these different backgrounds. The only problem is with the ex-politicians who may not be truly ex-politicians and their analysis may be politically tainted. This is highly likely in Ghana with its profoundly polarized politicking where even ex-politicians still campaign on political platforms and continue to identify with their parties in order to rent-seek within the state. Their neutrality on the fiscal council will therefore be questionable.

In relation to the tenure of council members being long enough to be independent of the election calendar, the experience varies. Periods of office are in general much shorter for council members than for members of executive boards (monetary policy committees) of central banks. The tenure is 5 years in Belgium, Canada, Germany, Slovenia, and the UK. The tenure is 3 years in Denmark, while in Sweden the original 3-year tenure was reduced to 1 year (Calmfors and Wren-Lewis 2011). In addition to the short tenure, members of fiscal councils in most jurisdictions can be dismissed at the discretion of the principal. The exception is the Office for Budget Responsibility in the UK where the consent of the Treasury Select Committee of Parliament is required. Another is Germany where the law does not grant power for the executive to dismiss members of the fiscal council (Calmfors and Wren-Lewis 2011).

So in Ghana if the proposed fiscal council is to be truly independent, then the tenure of council members should go beyond 4 years which is the tenure of every government. There should perhaps also be an entrenched provision in the constitution establishing the council which no government on its own volition can change without the approval of the citizens. Moreover, dismissal of council members should be barred. In this regard, it is heartening to note the assurance that was given by the Minister of Finance, Mr. Ken Ofori-Atta, when he was presenting the 2017 budget on the floor of Parliament on Thursday, March 2, 2017. He said "legal backing will be given to the fiscal council through an amendment of the Public Financial Management Act 2016 (Act 921), to inter alia capture all the elements of a fiscal responsibility law" (Ofori Atta 2017). This legal guarantee will only work if it is entrenched so that successive governments cannot scrap it if they are uncomfortable with it. Such legal guarantees are lacking in Hungary where only after 2 years of existence, the council had its secretariat hived out and the institution was debased into a more toothless entity. The new body comprised a chair nominated by the President of the Republic, the Governor of the Central Bank, and the Director of the National Audit Office. This happened after the council had criticized the government's budget for its optimistic assumptions and lack of transparency (Calmfors and Wren-Lewis 2011). Nevertheless, formal safeguards provide cover only to some extent. Eventually, fiscal councils have to engender independence and legitimacy in an informal way by cultivating a reputation for transparency and for impartial and rigorous analysis (Chote 2013).

## Effectiveness of the Council

The Akufo-Addo-led government wants to be viewed as constraining its future actions by proposing the establishment of a fiscal council. Once instituted it is likely for the constraints to start to bind, and this may motivate the government to disregard the council's wise counsel. There is also the likelihood that the government will interfere in the council's activities or in the extreme scenario, disband it. The picture is likely to be even gloomier for the council if the New

Patriotic Party (NPP) government, which proposed the establishment of the council, loses power. If the succeeding government is not comfortable with the council, it may scrap it. This is especially highly probable if the assessments of the council are highly critical of government policy to the extent of embarrassing the regime (Chote 2013). On the other hand, if the council produces good quality and impartial analyses, this could be a basis for "building reputation strong enough to create public opinion pressure on government." Moreover, in such a scenario, the government "cannot ignore opinions and recommendations presented by the council" (Franek 2015: 40). This implies that in public financial crisis, the government may even use the council's "recommendations as a form of support in making decisions which are difficult to accept by public opinion" (Franek 2015: 40).

Across Africa, governance institutions have failed to deliver on their mandate because of financial constraints. In Ghana specifically, institutions like Parliament, NMC, CHRAJ, and NCCE, among others, are bedeviled by financial constraints, which have culminated in their appalling performance (CDD 2005). Also if the information a fiscal council requires is not forthcoming from government institutions, its success will be in doubt. This is likely to be the case for the proposed fiscal council because a Freedom of Information Bill which will oblige public organizations to furnish information on their activities on demand by citizens and groups is languishing in Parliament for close to a decade now without passage. So the effectiveness of the proposed fiscal council will be hampered if it is starved of the requisite funds and information it needs to discharge its mandate. Chote (2013) agrees when he observes that a fiscal council's effectiveness can be damaged if the resources and information it needs are not availed to it or are woefully inadequate. So to avoid this funding squeeze, the council's budget should be fixed several years in advance, and published, which would make it quite formidable to exert financial pressure on a year-by-year basis.

Appointment can also be a factor which can undermine the effectiveness of the proposed fiscal council. The power of appointment can be a crucial tool for engendering good governance. However, in Ghana this has been abused among others because considerations of personal loyalty have overridden ability to perform (Oquaye 2000). For example, the Council of State was invented in 1969 to strengthen the checks and balances system under the Constitution. However, this mechanism over the years has been dented and made ineffective because the President controls the appointments. Members generally are used as errand boys and girls for the President, are seen on government party platforms, and are regarded by Ghanaians as not having the guts to speak truth to power. They cannot disagree with the President, and they express only what pleases the government in return for party patronage gains. It is therefore highly probable that members of the council will not be able to speak their minds. Moreover, the government may be able to exert pressure on the council to alter elements of its analyses.

The power of appointment by the executive has undermined the effectiveness of the Belgian fiscal council, the High Council of Finance. The council was left in an indeterminate state for several years, incapable of making policy recommendations. This was because the Finance Minister had declined the renewal of the mandate of incumbent council members or appointment of new personnel (Chote 2013). Also, the future of the Canadian fiscal council (the Parliamentary Budget Office) hangs in a balance following the government's refusal to appoint a permanent replacement to the outgoing Parliamentary Budget Officer before the end of his tenure (Chote 2013). So if Ghana wants its proposed fiscal council to be effective, the current and subsequent governments should refrain from refusal, delay, and using non-meritocratic methods of appointments.

Ultimately, the proposed fiscal council has to be accountable and responsive to the executive and Parliament and yet remains independent of both. Its final responsibility should be to the Ghanaian people. The public is entitled to be furnished with the good judgment of the council irrespective of whether politicians find it receptive or not. For the purpose of protecting its

legitimacy, it is incumbent on the council to enjoy bipartisan support. So far objections to the setting up of the council by the opposition National Democratic Congress (NDC) have not been voiced, which is a sign that it may enjoy support across the political divide.

Achieving a balance between accountability and independence will be a difficult undertaking. The board members of the proposed fiscal council who will exercise oversight could play an important role. Their duties and responsibilities will be to make certain that the council is able to discharge its mandate in the most professionally desired and effective manner. They will be responsible for ensuring that the strengths and weaknesses as well as successes and failures of the council for each year are captured in the annual report. Their watchdog role is also advantageous in another respect, that is, they can furnish a second opinion and an avenue of communication if the council is especially worried about the behavior of politicians – or if the elected officers are troubled by the council's conduct (Chote 2013).

## Discussion

The analysis in this paper indicates that both the prospects and challenges of establishing and running a fiscal council in Ghana are looming. In terms of challenges, the inclination toward deficit bias shows no sign of abating especially so since the country started producing and exporting oil in 2010. Since the discovery and exportation of oil in commercial quantities, the country has tended to be borrowing more and spending more. Compare the pre-oil borrowing level of 2006 of 26.2% of GDP to oil regime level of 72.6% at the end of November 2015 (African Development Bank, Organization for Economic Cooperation and Development & United Nations Development Program 2015; Institute for Fiscal Studies 2015). This evidence confirms the prediction in the literature that if not constrained democratic governments would be susceptible to "deficit bias" and "pro-cyclicality" in their management of public finances. That on average they borrow more than they should and, that in particular, they spend too much or tax too little when the economy and the public finances both appear to be in good shape (Calmfors and Wren-Lewis 2011).

In regard to the proposed council's independence, one of the challenges that appear insurmountable is the disregard for constitutions and constitutionalism. This makes leaders to want to have their way by disobeying laws and rules, intimidating countervailing centers of powers, and interfering in the work of independent monetary, audit, and fiscal institutions. For example, there is political interference in the work of the supreme audit institution in Ghana. For example, only recently the Auditor General petitioned President Akufo-Addo to the effect that the politically appointed board chairman of his outfit was unlawfully interfering and violating his constitutional mandate. According to him, the board chairman attempted to interfere in audit processes and took procurement decision in his absence as well as unlawfully circulated audit circulations (Banaseh 2018). Government was also accused of contracting parallel private firms to conduct special audit of the accounts of some public agencies without recourse to the Auditor General (Aseidu-Nketia 2018). This action, according to the opposition National Democratic Congress (NDC), is usurpation of the power of the Auditor General. Under the 1992 Constitution, only the Auditor General is authorized to conduct audit of public agencies. Where for some good reasons such audits have to be carried out by private firms, it has to be with the consent of the Auditor General who chooses the private firms. Such political interference undermines the independence of the supreme audit institution and twists audit findings in favor of executive desires rather than the public interest. There is therefore no guarantee that when established the government will not interfere in the work of the fiscal council.

In terms of effectiveness of the fiscal council, factors such as lack of funds, lack of access to information, and the president's power of appointment are stark realities in Ghana. These factors potentially can undermine the effectiveness of the fiscal council. For example, access to government

information is extremely limited. To illustrate, the Freedom of Information Bill which would have guaranteed public access to government information has been languishing in Parliament for over two decades without passage (Raviv 2016). Because of lack of funds, the Auditor General's Department in Ghana by June 2009 had a backlog of 27 reports to present to Parliament. The auditing of foreign exchange receipts and payments of the Central Bank (Bank of Ghana), local governments, and public boards and corporations was in arrears for 3 years (GNA 2009). Due to financial limitations, the Auditor General's outfit covers only 70% of its entire audit annually (Daily Guide 2013). There is therefore no guarantee that when established the fiscal council will have access to government information it requires and that its activities will be adequately funded.

This view joins Hagemann (2011) when he argues that the evidence on the effectiveness of fiscal council is limited or indeterminate. He conducted comparative analyses of fiscal indicators of a sample of countries (Belgium, Chile, Hungary, and the UK) before and after the formation of fiscal councils. He found that in some cases fiscal councils impacted positively on fiscal performance, while in some others they did not. In Romania the current public debt is worse than in previous years when a fiscal council was absent. The Romanian fiscal council was established in the middle of 2010. In 2013 that country's public debt was 37.9% of GDP, while in 2009 it was lower at 23.2% of GDP and was even much lower in 2008 at 13.2% of GDP (Franek 2015). The case of Sweden also clouds the claim that fiscal councils have contributed to improved fiscal performance. This is because despite the existence of a fiscal council, public debt has not decreased substantially. In 2007 following the creation of the council, public debt constituted 38.2% of GDP, while in 2013 it marginally decreased to 36.8% to GDP. When juxtaposed with the years prior to the establishment of the council, the rate of decrease of the public debt-to-GDP ratio was bigger. The debt decreased from 70.3% of GDP in 1996 to almost 50% of GDP in 2002 (Franek 2015). The evidences above show that the issue of the effectiveness of fiscal councils is far from settled.

## Conclusion

This paper examined a priori the chances of success and the potential pitfalls of the proposed fiscal council in Ghana. The investigation was in relation to whether Ghana needs a fiscal council; the functions the council will perform; the independence of the council; the effectiveness of the council; and the potential problems and measures for resolving the problem. The evidence showed that indeed Ghana needs a fiscal council in view of the country's inclination to deficit bias and seemingly unsustainable debt trajectory. It also found that the functions that the government intends to assign to the council are somewhat circumscribed which may debase its influence and impact. In addition, it is also highly probable that the independence and effectiveness of the council will be sacrificed due to Ghanaian governments' propensity to circumvent their own laws, starve governance institutions of requisite resources, and use party loyalty rather than meritocracy in appointments to key governance institutions. The paper concludes that unless these minutiae are adequately addressed, achieving fiscal discipline in a fiscal council regime will be quite formidable.

## Protected Disclosures Act: Whistleblowing in an Anti-informer Culture

Omar E. Hawthorne
Department of Government, University of the West Indies, Mona, Kingston, Jamaica

### Synonyms

Corruption; Culture; Disclosures; Informant; Informer; Protection; Transparency; Whistleblower

## Definition

Whistleblowing may be plainly defined as the act of exposing unlawful activities or misconduct occurring in a society or organization. It is notably a key instrument in the fight against corruption and in the promotion of transparency and openness.

## Introduction

A country's culture and attitude to reform might be as, or more, pivotal than legislations passed. In Jamaica, a country with a strong anti-informer culture, (The Protected Disclosures Act 2011) represents a legislative thrust to encourage whistle-blowing in a strong anti-informer culture. Whistle-blowing is increasingly recognized as an important effective tool in the prevention and detection of corruption and other dereliction. The nature of corrupt behavior means that it is highly likely that it may never come to light unless people who come across corrupt acts in the course of their work feel that they can report them without facing retaliation. Studies have shown that reports of fraud in companies often come to the fore thanks to whistle-blowers who, some studies have shown, detect internal problems more frequently than any other actor, including auditors, regulators, and the media.

(The Protected Disclosures Act 2011), regarded as one of the best pieces of whistle-blowing legislation enacted globally by the Organisation for Economic Co-operation and Development (Jamaica Information Service 2014). The Act was further commended by the head of public sector of the Association of Chartered Certified Accountants (ACCA) in the United Kingdom (UK), Gillian Fawcett, as the legislation's provisions, in principle, and accompanying supporting guidelines are deemed pivotal in relation to executing anti-fraud and corruption measures by protecting individual who decide to report wrongdoings. With all of this praise, it is therefore imperative to assess what are some of the possible reasons why the Act has yet to receive a formal report of whistle-blowing.

It is therefore appropriate that the legislation be examined in order to ascertain the factors that are possibly contributing to the lack of reporting to the Commission for the Prevention of Corruption (CPC) on whistle-blowing. Is it a matter of lack of regulations promulgated under or does the informer fi dead culture influence individuals in not making reports? Conversely, there is a strong possibility that the public is unaware of the legislation and therefore have simply not utilized it. Whatever the reason(s) are, it is imperative to review the legislation and provide regulations to accompany the Act. It might very well be the case where, due to the lack of regulations, it might facilitate and or foster a climate where even if and when matters of whistle-blowing are reported and dealt with privately in a firm; the statistics and information are not forwarded to the CPC.

Protecting one's right to come forward with wrongdoings is closely related to protecting one's freedom of expression and conscience. The UN Convention against corruption held in 2003 helped provide the framework for cooperation for states with regard to corruption. Moreover it introduced a comprehensive set of standards, measures, and rules that all countries can apply in order to strengthen their legal and regulatory regimes to fight corruption. Furthermore this convention also included a provision concerning whistle-blowers in Article 33, entitled "protection of reporting persons" which states that: "Each State Party shall consider incorporating into its domestic legal system appropriate measures to provide protection against any unjustified treatment for any person who reports in good faith and on reasonable grounds to the competent authorities any facts concerning offences established in accordance with this Convention."

Jamaica was ranked by Transparency International as highly corrupt and ranked 83rd of 176 countries globally in the 2016 Corruption Perception Index. The whistle-blowing legislation is one such means of improving the ranking of Jamaica. However, since its passing, there have not been any cases reported to the Commission that is tasked with monitoring compliance.

## Informer Fi Dead Culture

Jamaica has long had an informer fi dead culture. The proverbs "see and blind, hear and deaf," similar to the phrase "see no evil, hear no evil, speak no evil" in essence, convey that you should pay attention to your own business and to not meddle in another person's affairs. These proverbs, to a large extent, sum up the perceived cultural attitude, of informer fi dead. Or rather the noting that he who keepeth his mouth, keepeth his life. And, especially, in a country with one of the highest murder rates per capita, in order to gain traction on this legislation, significantly more than creating the legislation is needed. The informer fi dead culture flourishes within the context of this crisis of public safety, "anarchic disorder," and a widespread perception by scholars of systemic weaknesses in governance and in policing (Johnson and Soeters 2015).

The prevalence of the informer fi dead culture flourishes especially in dancehall music. In many songs, dancehall artistes call for "informers" or "snitches" to pay for their treachery with their lives. Therefore, with the strong cultural sentiments of minding one's own business, it is not surprising that whistle-blowers are reluctant to blow the whistle on wrongdoings and hence no recorded report to the CPC. In general, the culture connotes staying out of another's affair. Quite often the person the alleged informer is reporting the matter to is not necessarily the police but just sharing information with others in regard to a violation. Johnson and Soeters (2015) emphasized that in order to fully understand "informerphobia" in Jamaica, one must comprehend the garrison phenomenon, and the powerful "alternative authorities," which have given a social basis to political order (and disorder) in Jamaica.

Despite the different measures in place that encourages disclosure, many individuals shy away from doing so for several reasons. The reality is that most countries do not have a culture of sharing such sensitive information. Thus, those who share information of this kind have to be prepared for the possible repercussions. In mild cases, individuals often fear that they will ostracized and distrusted. In other cases, persons fear that their employment will be terminated as a direct result of their actions. At the extreme end of the spectrum, fear of malicious reprisal or death silences anyone who has the slightest idea of sharing information and so they decide to turn a blind eye (Johnson and Soeters 2010).

In the Jamaican context, potential informants fear for the lives more than any other repercussion (The Jamaica Gleaner 2015). It is important to note though that anti-informer culture is not specific to the Jamaican reality. Evidence points to fatal and otherwise difficult situations for informants even in countries recognized for their introduction and adoption of whistle-blower legislation (Baker 2010). Jamaican culture, through music and popular culture, frowns upon the practice of being informants. Political psychologist (Charles 2013) explores extensively the responses to informant culture in dancehall music and Jamaican popular culture over the years, comparing and contrasting the extant anti-informant discourse.

## Protection for Whistle-Blowers

The Act seeks to protect whistle-blowers by shielding them from what it describes as an "occupational detriment," which has defined as an act or omission resulting in disciplinary action; suspension or demotion; dismissal; harassment, intimidation or victimization' transferal against one's will; refusal of a transfer or promotion; subjecting the employee to a term or condition of employment or retirement from employment, that is, altered to his disadvantage; providing an adverse reference; denying appointment to any employment, profession or office; threatening those actions; or otherwise adversely affecting the employment, profession or office, including employment opportunities and job security of the employee. With this said and despite having received high global ratings for the whistle-blower legislation, Jamaica is encountering problems as it relates to the enforcement of the legislation. Addressing the lack of regulation might be a key starting point. In that, accompanying regulations to the legislation are not in place.

Hence, detailed regulations on the scope of application of the procedures of the legislation might yield more results. The legislation affects both public and private entities, but, without regulation, it is unlikely that we will see improvement in reporting.

The risk of corruption is significantly heightened in environments where the reporting of wrongdoing is not supported or protected. Public and private sector employees have access to up-to-date information concerning their workplaces' practices and are usually the first to recognize wrongdoings. However, those who report wrongdoings may be subject to retaliation, such as intimidation, harassment, dismissal, or violence by their fellow colleagues or superiors. In many countries, whistle-blowing is even associated with treachery or spying (Banisar 2011). The current legislation seemingly provides protection for whistle-blowers, and it is in tandem with best practices of similar acts that show a balance should exist between being overly prescriptive thereby making it difficult to disclose, or overly relaxed, allowing for unlimited disclosures, which in the end may not encourage internal resolution of issues within the organization.

Subsequently, in assessing other jurisdictions, the use of incentives to encourage reporting has shown to be effective. For instance, in the United States, the False Claims Act allows individuals to sue on behalf of the government in order to recover lost or misspent money and can receive up to 30% of the amount recovered. Likewise the Dodd-Frank Act authorizes the SEC to pay rewards to individuals who provide the commission with original information that leads to successful SEC enforcement actions. In South Korea, for example, Korean law also provides monetary rewards for whistle-blowers who disclose acts of corruption. The Anti-Corruption and Civil Rights Commission (ACRC) may provide whistle-blowers with rewards of up to USD two million if their report has contributed directly to recovering or increasing revenues or reducing expenditures for public agencies. The ACRC may also grant or recommend awards if the whistle-blowing has served the public interest.

There is wide gap between the first US whistle-blower legislation, which incentives persons to disclose corrupt practices by providing a financial reward to do so and the current trend that seeks merely to avoid retaliation against whistle-blowers. So in the first case, you will be rewarded if you report misconduct. In the second instance, you will not be punished if you do. It is obvious that the earlier approach is a greater incentive.

Some criticisms have been launched at the Protected Disclosures Act, coming notably from the Commonwealth Human Rights Initiative (CHRI). The latter criticized the types of misconduct on which disclosure may be made, stating that it is too restrictive and excludes disclosure to the commission of the human rights violations as a category entitled to protection (The Law Reform Commission 2014). An employee is only protected if the disclosure is made in good faith and in the public interest.

A disclosure of information is not protected under the Act if the employee making the disclosure commits an offence by making it. Thus, if an employee, who does not have authorization to access a document, which has been categorized as secret or confidential by the organization, reveals such information under the Act, he does not have the benefit of protection. This section has also been criticized, and it has been argued that it is not uncommon for employers to hide documentary evidence of wrongdoing by stamping the document "secret" or "confidential" with access being restricted to a few officials only. With this in mind, and if employees are supposed to make reports on "improper conduct" and make a disclosure under this Act, such disclosure should receive the benefit of protection in the larger public interest. Without protection to the employee, there is no incentive to make such a report when he/she can face retaliation for releasing company information. The CHRI supports therefore that an official should receive the benefit of protection if misconduct is exposed through the unauthorized obtaining and disclosure of classified information.

Another deficiency with the new law in Jamaica is that it introduces what is tantamount to a cumbersome scheme for determining what is protected from what is not. Here, there is a real danger that many disclosures will be denied protection under the Act because the employee may not have followed correctly the prescribed procedure.

Moreover, critical areas are left out of the Act. For example, the Act does not authorize the disclosure of information that is protected by legal professional privilege. These are vexing issues that challenge some of the deeply entrenched ideas of the lawyer – client relationship (McKoy 2012).

Currently, the Protected Disclosures Act of Jamaica has not achieved what many hoped that it would have achieved. In that, it has certainly advanced significantly an important area of workers' rights, but based on the lack of any recorded instance of whistle-blowing, it may not have significantly advanced the broad anti-corruption project (McKoy 2012). In order to make a dent into the informer fi dead culture, and to see fruit from the legislation on whistle-blowing, it is imperative that public awareness and training efforts be given high priority, citing that if and when citizens risk their livelihoods and sometimes their lives to expose corruption, there ought to be more than the feeling of doing "good."

Perhaps, a weakness in policy administration after the legislation was passed is that no efforts were made to launch a public awareness campaign that would, to some degree, counter the strong informer fi dead culture in Jamaica. The probability that the average Jamaica is unaware of this legislation is highly significant. Therefore, the inference can be made that if the average Jamaican is not aware of the legislation, it is highly unlikely that he/she will be aware of the requirements in filing such reports. The benefits of a public awareness campaign would be that it would sensitize the public to the remedies and sanctions in the event they have made a report and is subsequently faced with some retaliatory actions. The Korean and Japanese models are among the best practices in terms of comprehensive remedies. Publishing data on the benefits of whistle-blowing goes a long way. The United States is probably the best case example on data as it pertains the relevance of whistle-blowing for the recovery of public revenues. At the global level, there is little data available on the number of cases reported, the effectiveness of reporting channels, and the financial benefits due to whistle-blowing (Transparency International 2010).

In the Caribbean, there is a brewing interest in whistle-blowing and in the protection of whistleblowers. In the wider Caribbean, Jamaica was first out the gate in 2011 with the Protected Disclosures Act; Trinidad and Tobago in 2015 passed a similar legislation. In the Dutch Caribbean, the importance of protecting whistle-blowers has been highlighted. In Guyana, the government in 2014 announced that it would be dealing with the protection of state witnesses in criminal matters, and to this end, approximately six bills were tabled before Parliament, including the Whistleblowers Protection Bill. In Barbados, there are also calls to protect whistle-blowers. While Jamaica is ahead of some of its Caribbean neighbors, there is still a long way to go in addressing the cultural aspect of informer fi dead.

## Conclusion

With just over 5 years after (The Protected Disclosures Act 2011) was passed and over 4 years since it was enacted into law, the CPC has no reported cases of whistle-blowing. Perhaps now it is prudent that there is an evaluation and review of the legislation as to why there have not been any reports. If there had been clear regulations perhaps, the CPC could systematically collect data and information as a means of evaluating the effectiveness of the whistle-blowing mechanism. However, both the public and private sectors would need to report instances of whistle-blowing, and with that, the CPC could ensure systematic data collection regarding the number of cases and conduct follow-up investigations where appropriate. Efforts like this would play a key role in assessing the progress, or lack thereof, in the whistle-blower protection mechanisms. Conceivably, in order to encourage whistle-blowing, a reward system, including monetary rewards, could be considered in a revised bill. However, this brings into focus several questions: Should the government provide financial incentives for disclosures? Is there a need for this? Would the benefits of having such an incentive scheme outweigh any negative factors it may bring? If the financial incentives are to be provided, how would they be funded? These are questions to be discussed, considered, and evaluated.

The practice of whistle-blowing should be institutionalized and de-stigmatized while ensuring that

adequate protection for whistle-blowers is guaranteed. The legislation is an important first step, however, regulations are needed. Hence, until such regulations are in place, it is highly unlikely that the private sector will have an incentive to turn over documents, statistics, and records to the CPC. A commendation regarding the legislation is that an existing agency, the CPC, was tasked with oversight rather than creating another new government agency. However, the blunders and seeming confusion by different government agencies regarding the Security Interest in Personal Property (SIPP) and the uploading of personal information of debtors online and the lack of clarity as it pertained to the regulations which should have been applied are more reasons why regulations are needed regarding the whistle-blowing laws.

Public support is needed to promote whistle-blowing. Therefore, until whistle-blowing is promoted as an effective tool for stopping corruption and serving the public interest, it will continue to have a negative connotation resulting in very little reporting. The government needs to lend its support to public information campaigns as well as create initiatives which would promote whistleblowing. A robust public awareness campaign to sensitize the public on the Act is needed, especially within the context of a culture that has a strong negative reaction toward "informers." Therefore, until the issue of regulation and cultural matters are addressed, the legislation will be another legislation on the books but largely ineffective and under-utilized. Consequently the following recommendations and regulations need to be drafted and put in place. Public attitude surveys on whistle-blowing are needed to help decipher (1) the public's awareness of the legislation and (2) their knowledge of the duties and rights as public and private workers. These will be steps in the right direction to sensitize the public and to assist in discrediting the informer fi dead culture.

# Provisions and Contingent Liabilities

Alessandra Allini
University of Naples Federico II, Naples, Italy

## Definition

The provision is a subset of liabilities with uncertainty of timing of settlement or amount to settle (Picker et al. 2012).

In accounting studies, a liability consists of future sacrifices of economic benefits arising from present obligations to transfer resources, or provide services, to other parties in the future, as a result of past transactions or events (Jones and

Pendlebury 2000). This obligation may be legal, which means that there exists a formal agreement or a contract between parties.

The existence of a liability may be also demonstrated through a *constructive* obligation arising from the normal business or past practices and circumstances creating a valid expectation that the obligation will be probably discharged by the firm. Thus, a present (legal or constructive) obligation occurs when the firm has no alternative options than to fulfill it. However, the likelihood of future outflows may also be probable, possible, or remote. In practice, such investigation is not always immediate. In this regard, when timing of settlement or amount to settle a liability is uncertain, there is a provision.

In the international accounting profession, provisions are regulated by specific accounting standards. Namely, within the private sector, the related International Accounting Standard is the no. IAS 37 issued by the International Accounting Standard Board (IASB), while for the public sector – which includes the State Owned Companies (SOEs) – the related standard is the IPSAS no. 19, issued by the International Public Sector Accounting Standards Board (IPSASB). Despite the existence of two different accounting standards (private vs. public sector), there is no real and concrete differences between the two rules in terms of definition, measurement, and recognition of provisions (Lapsley et al. 2009; Biondi 2014).

Focusing on the IPSAS no 19, the standard does not provide a direct definition of provision; rather, the term is framed through a residual approach, after having clarified the concept of liability (Berger 2012).

In this sense, the provision derives from past events leading to a present obligation (so-called obligation event). Such obligation event is required to exist before the end of the financial reporting date, and it may arise from either constructive or legal obligations (IPSAS No 19 2002, § 18). However, it could also happen that an event does not origin, immediately, an obligation, but later due to changes in the legislation.

This is the case when an existing law does not engage an SOE to cover environmental damages caused by its operating activity. But if a new requirement has been issuing and recognizes the SOE's responsibility for existing damages, an obligation event arises under the new scenario.

## Recognition

The identity of the counterpart to whom an SOE has the obligation is not a condition to recognize a provision, so that the obligation may be also to the public at large.

Instead, reliable estimation of outflows represents the main condition for recognition. The concept of probability of outflows, however, is not well clarified. It is generally interpreted with the concept that "it is more likely than not" to occur. It can be argued that if the likelihood of an outflow is 50% or less, then the obligation is considered as "possible." Firms have to assess probability for each present obligation in order to distinguish between liabilities and provisions (IPSAS No 19 2002, § 31).

Typical transactions that may produce a provision are related with warranty, restructuring, or onerous contracts. To this end, the promulgation of a law on the existence of a contaminated geographical area may produce an expected probable outflow of resources by an SOE, which imposes the recognition of a provision for the best estimate of the decontamination expenditures. Payments for damages connected with legal cases that are probable shift toward recoding of provisions. Indeed, the outsourcing of a business unit communicated to employees gives rise to a constructive obligation. Outflows of resources are probable; hence, a provision needs to be recorded for the best estimate of the costs determined by the outsourcing of activities.

Conversely, no provisions are permitted for net deficits from future operating activities. Lastly, social or employee benefits are not provisions.

## Contingent Liability and Asset

A provision differs from what is called as contingent liability. Contingent liabilities refer to other transactions that encompass a dissimilar aspect in terms of definiteness and measurability. It deals with the concept of a possible obligation, which

means that it is not probable that the company will have an outflow of resources in the future, or with the uncertainty of the amount, which means that the measurement of the obligation is not reliable (Picker et al. 2012).

Since the contingent liability may be possible or probable, it should be continually assessed by an SOE.

For example, if an SOE is subject to legal proceedings and claims deriving from its current activities, and the amount that should be paid is reliable, but there is no material expectation about the adverse event, this transaction represents a contingent liability. Indeed, the issuance of guarantees on behalf of the employees may be classified as contingent liabilities.

When a firm incurs in a contingent liability, its recognition in the financial statement is not permitted; rather it must be just disclosed in the financial notes, unless the settlement is at least considered remote (IPSAS No 19 2002, § 36).

The amount to be disclosed in the notes should represent the best estimate of outflows to settle the obligation. For example, legal fees that may derive in a court case would be included in the assessment of the costs of the contingent liability. However, in the case an SOE cannot estimate such fees with reliability, disclosure is required indicating the extent to which such costs are considered.

Some contingent losses will not originate liabilities; rather, they may represent an impairment so that a reduction of the amount of the asset may be recorded (Picker et al. 2012).

Instead, corporate tax disputes, failure of a counterpart that an SOE has guaranteed or legal claim against an SOE are some examples of expected contingent losses. Of course, while users of financial reporting prefer more disclosure on risks and contingencies, managers may claim that the range of risks is too high and the information depends on future events. Decision on what disclose about contingent liabilities is an important aspect and should be framed into a clear process that supports and helps managers to assess associated potential risks.

At the same time, users should understand the nature of such risks associated with contingent liabilities and interpret properly related information. Several countries have created their own framework to ensure comprehensive assessment of risks by contingent liabilities. Some rules, for example, ask SOE to approve only projects that pass the cost-benefit approach, are of value for money, and embrace a rigorous risk assessment process.

Contrary to contingent liabilities, a contingent asset is a possible asset arising from past events, and its existence is confirmed only by the occurrence of future events outside the control of the firm. They cannot be recorded in the financial statement; rather, the notes to financial statement should provide a brief description of their nature (IPSAS No 19 2002, § 39).

Since the recognition of provision in the financial statement is not so immediate, possible (involuntary) error may occur. In particular, when provisions have not been properly recognized at the reporting date, an SOE should immediately restate the financial statement and report information in the notes. However, when there is a bias, so relevant as to affect investors' decision, possible legal consequences may arise.

## Measurement

Once an SOE has provided that the obligation origins a provision to recognize, the amount to be reported in the financial statement at the end of the reporting date should reflect the best estimate of the amount to settle rationally the obligation, without considering tax effects or equivalents. Such measurement is difficult to formulate, since there are many uncertainties surrounding the assessment, and managers have to use judgment. Judgments are usually made with caution concerning what and when the obligation should be settled and what should be the possible scenario (Picker et al. 2012).

If there is a range of possible probabilities, then the mean of single probabilities as a whole is used to adopt the best estimate (IPSAS No 19 2002, § 44).

A simple example can clarify the issue. Suppose that an SOE provides radiography machines to other public and private medical firms and hospitals and the equipment is supported by a warranty condition under which firms are covered for the cost of repairmen due to defects within first year after purchase. If minor defects occurred in all equipments, repair costs of three million would result. If major defects were occurred in all equipments provided, repair costs of eight million would result. The past experience and future expectations suggest that 70% of the equipments will show no defects, 25% of the equipments will have minor defects, and 5% will have major defects. Accordingly, an SOE should assess the probability of an outflow for the warranty obligations as a whole; hence, the expected value of the cost of repairs to be recognized as provision will be (70% of nil) + (25% of 3 m) + (5% of 8 m) = 1.150 million.

Conversely, whether probabilities of outflows are either higher or lower than the best most likely outflow, the estimate will reflect a higher or lower measure.

When the effect time is material, the amount of the provision requires also to be discounted to present value by using, normally, a pretax discount rate. Such rate has to reflect the specific risks associated with the time value of the money. Practically, firms tend to adopt the rate employed for liabilities with similar terms and conditions or a free-risk rate (e.g., governmental bonds) adjusted for the specific risks of the provision. Of course, if a future event occurs in advance, the estimation of the expected present obligation should include such adjustment when the expectation is reliable. For example, an SOE may perceive that cleanup costs for unlawful environmental damage are lower, due to expected future changes in technology tools (Picker et al. 2012).

An SOE is required to review provisions at the end of each subsequent reporting period in order to ensure that they reflect the current best estimate of expected outflows, and if no probabilities still exist, then the provision should be reversed. Of course, a risk adjustment approach may increase the amount at which the liability is measured.

In the case the settlement is expected to be concluded by a third party, such event will be recorded as an asset. The condition is that the reimbursement is virtually certain. This could be the case of an insurance contract. Usually, the value of the reimbursement shall not exceed the value of the provision.

The international accounting standard for the public sector requires that a provision may be used only to front expenditures for which that provision has been originally created and cannot be used to cover outflows related to other purposes. In this regard, any unused amounts should be reversed.

## Particular Transactions and Provisions

The IPSAS no 19 includes the so-called onerous contracts which represent a peculiar transaction originating a provision. It consists of an agreement "in which the unavoidable costs of meeting the obligations under the contract exceed the economic benefits or service potential expected to be received under it which includes amounts recoverable" (IPSAS No 19 2002, par. 79).

In fact, the firm is expected to fulfill the contract and has a present obligation. An example of such onerous contract exists when an SOE service supplier (e.g., for electricity or water) has entered into a contract to supply services at a price lower that the one at which it has been contracted to receive. The amount to be recorded in the financial statement is the present obligation net of recoveries. The unavoidable costs include the least net cost to exit from the contract, which is the lower between the cost of fulfilling the obligation and any compensation or penalties arising from failure to fulfill it.

Some provisions may also derive from business combinations among SOE. The IPSAS no 19 called them "restructuring provisions."

They derive typically from the event related to the "closure of a branch office or termination of activities of a government agency in a specific location or region or the relocation of activities from one region to another; changes in management structure, for example, eliminating a layer of

management or executive service; fundamental reorganizations that have a material effect on the nature and focus of the entity's operations" (IPSAS No 19 2002, par. 81).

However, an SOE may recognize such provisions only in the presence of some requisites. Specifically, a detailed formal plan of the restructuring should exist, specifying at least the operating units, the main involved locations, the role and number of employees incurred in the business combination who will be compensated for concluding their activities, the expenditures to support, and the timing of the plan. Furthermore, the existence of a real expectation to implement and carry out the restructuring activities is also required.

For example, an SOE may inform on the implementation of a restructuring plan through a public announcement or a notification of intention to cancel leasing contracts. A public announcement leads toward a constructive obligation for an SOE only if it affects and creates the valid expectations by interested stakeholders (like users of the services, suppliers, and employees) that such plan will be realistically carried out. Of course, in general, an expected restructuring provision may result from events other than the public announcement by the government or official agencies. They include, for example, negotiations with employee representatives for termination benefits.

The amount of the restructuring provision should reflect only some types of expenditures. Specifically, in order to reduce accounting discretion by managers, the international accounting standard requires only expenditures related with the restructuring and not with the ongoing activities of the SOE. To this end, retraining or relocating continuing staff, marketing and investments in new systems, and distribution networks expenditures cannot be included in the measurement of the restructuring provision.

## Information on Provisions

The IPSAS no 19 prescribes several information that should be included in order to guarantee better transparency (IPSAS No 19 2002, § 97). For each class of provision, some information an SOE should disclose includes the carrying amount, changes in existing provisions, and the amounts used during the period. Narrative information concerns description of the nature of the obligation and the expected timing of any outflows, uncertainties about the amount or timing of those outflows, and the amount of any expected reimbursement.

Disclosure about provisions is an important part of the financial reporting since it helps to better understand nature, probability, and event surrounding this kind of liabilities.

In particular, even if the public accounting standard provides several guidelines to ensure that the measurement and recognition of provisions are credible and faithfully conducted by SOE, there still exists a certain range of discretionary managers may exercise, due to the intrinsic nature of such item.

# Psychology of Crisis Evacuation

Craig Barham
Department of Urban and Public Affairs, University of Louisville, Louisville, KY, USA

## Synonyms

Disaster psychology; Psychology of catastrophe contexts; Psychology in emergency situations

## Definitions

The highly dynamic phenomenon of human behavior during disasters and emergencies that result in evacuations.

## Introduction

An accurate understanding of human behavior in disasters and emergencies is critical to minimizing the fatalities and injuries that may arise during a dispersal or evacuation and to ensuring that the response by disaster agencies, or the coverage of the media, does not become a greater risk to human safety than the crisis event itself (Donald and Canter 1990; Quarantelli 2001; Sime 1990). The traditional assumption of collective behavior in crisis events was that crowds were over-emotional and irrational which often leads to mass panic and disorganized and dangerous dispersals and evacuations. These assumptions about collective behavior, when held by and acted upon by those with responsibility for disaster and emergency management, have particular and far-reaching implications (Chertkoff and Kushigian 1999). The traditional assumptions of crisis psychology rested on theories of mass panic, fear-induced flight, or post-event paralysis; contemporary theories, supported by a considerable body of empirical evidence, suggest that collective behavior is usually socially meaningful and constructive and demonstrates stable patterns of collective agency, endurance, adaptation, and collective resilience (Aguirre 2005; Drury 2012).

The traditional behavioral assumptions have given rise to "disaster myths" which have influenced public policy and practice, mass media and public discourse, and popular culture. In addition to myths about crowd behavior, the traditional assumptions also suggest that the constituted authorities always know best and behave moderately and rationally. These myths are not supported by empirical evidence; however, they persist and encourage counterproductive practices that potentially exacerbate the effects of disasters and emergencies and undermine the public's collective resilience (Dynes 2003; Tierney 2003). Understanding how crowds and the authorities actually behave under a range of stressful and life-threatening conditions is necessary for proper emergency planning, can lead to more appropriate official and public responses to crisis events, and guide the design and layout of the built environment to facilitate safer crowd dispersal and evacuations. Facilitating emergency management best practices can encourage a more desirable collective social response that can reduce the possible negative impacts of a disaster or emergency (Donald and Canter 1990; Quarantelli 2001; Sime 1990; Williams and Drury 2010).

A range of events come under the broad headings of "disaster" and "emergency." Disasters and emergencies often trigger dispersals and evacuations which usually involve a mass of people, who face an actual or perceived threat of injury or death, in which there is still a subjective possibility of escape within a time-limited window and through a physically restricted space (Quarantelli 2001; Drury and Cocking 2007). Dispersals and evacuations can be physically and psychologically stressful on both evacuees and emergency workers making medical and psychological care an important component of disaster and emergency management (Alexander 2002). Even in the absence of injury and death, disasters can take an emotional toll (APA 2017). Crisis

psychology deals with the negative reactions and responses of victims and witnesses of disasters and emergencies but also reactions and responses that demonstrate psychological robustness, resilience, and collectively pro-social behavior (Quarantelli 2001; Alexander 2002; Tierney 2006; Drury and Cocking 2007; APA 2017).

## Theories of Behavior in Crises and Evacuations

In crisis-related events, it is possible to identify typical patterns of collective behavior. These behaviors depend on the scale of analysis, the type and nature of the crisis event, the frequency with which a group is exposed to crisis events, and the times in the social life of a group when a crisis event takes place (Quarantelli 1999, 2000, 2005). The scale of analysis can be either at the individual, organizational, community, or national level each of which can affect collective behavior in different ways (Phillips et al. 2012). Most crisis-related events impact a large group, but they also impact small groups or people who are isolated or widely dispersed. Among large groups, and in more routine disasters, there are often the mechanisms and the capacity for survivors to receive the mutual social support that emerges from people who share a common experience, while in catastrophes or among dispersed groups, that capacity may be absent or the mechanisms may have broken down (Jacob et al. 2008).

Crisis-related events can also be distinguished along a continuum from emergencies, to disasters, to catastrophes; and their cause can be natural, technological, social, religious, or political (Phillips et al. 2012). Crisis-related events can be further distinguished by whether they are consensus-driven or conflict-driven; whether they take place in homogeneous communities characterized by high trust or heterogeneous communities characterized by low trust; whether they represent a major threat to life and property and a significant disruption to the routine social and economic order; or whether the community is able to restore its routines quickly and smoothly. The behavioral response in each case might be quite different due to the presence or absence of collective social support mechanisms or because these events may have different social constructions (Phillips et al. 2012).

The scope of a crisis, and its spatial, temporal, and informational characteristics, will also produce major differences in behaviors (Phillips et al. 2012). A crisis may take place in a concentrated space or over a large area; there may be a large volume of accurate information about a crisis, or there may be limited or inaccurate information available to the public; and it may occur quickly or evolve gradually. Individual, community, organizational, or institutional factors often weigh more heavily in the overall outcome of a disaster or emergency than the actual crisis event itself (Phillips et al. 2012). Identifying the context and nature of a crisis is important because such factors produce qualitatively and quantitatively different impacts that will affect behavioral responses to a crisis in both degree and in kind.

Psychological and sociological models of crisis behavior have evolved considerably during the twentieth century, and early theories based on antisocial crowd behavior have given way to theories which increasingly emphasized the pro-social aspects of group behavior (Turner and Killian 1957; Rule 1988; Mawson 2007). The contagion, asocial, convergence, value-added, normative, and emergent behavioral theories are good examples of the evolution in thinking. Contagion theory was the dominant perspective on crowd behavior in the first half of the twentieth century (LaPierre 1938). It was the product of an intellectual mindset that was influenced by more than a century of social conflict that often resulted in mob violence by the poor and politically dissatisfied (Le Bon 1960). Elites in the twentieth century were very disturbed by this violence and concerned about the breakdown of social order. They were convinced that normally rational individuals became unduly influenced by strong, irrational emotions of other people in crowds and could no longer control their unconscious instincts.

The negative conception of collective behavior contained in contagion theory remained popular well into the twentieth century until it was

gradually superseded by theories which emphasized more rational, cooperative, and purposive human behavior (McPhail 1997; Mawson 2007). The asocial conceptualization of collective behavior was advanced by Quarantelli (1954, 1957) who suggested that people in crowds, when placed in a position of fear for their safety, acted rationally but with self-interest. Primary group ties were temporarily suspended as people engaged in highly individualistic behavior. Asocial crowd behavior suggests that the rare instances of fear-induced flight should be considered as a nonrational, rather than irrational, individual behavioral responses to specific and contributory circumstances which produce collectively suboptimal outcomes (Mawson 2007). The Lang and Lang (1961) further refined these behaviors into terror responses, mob escapes, and mass panics and articulated their different sources or triggering events, stages, and outcomes.

Convergence theory suggests that crowd behavior is reflective of the attitudes and behavior of the individuals who decide to join a crowd. Smelser (1963) suggested that certain specific conditions produced specific collective behaviors – a range of panic behavior – which could be distinguished by the "generalized beliefs" of the individuals in the crowd. It is not the crowd that affects the behavior of the individual, but the convergence of like-minded individuals with pre-existing values, beliefs, and behavioral dispositions that affect the behavior of the crowd (Goode 1992). Convergence theory thus agrees with contagion theory that people in a crowd may do something that they would not do by themselves; but, the antisocial behavior of the crowd largely reflects the individuals who compose it. Smelser (1963) also put forward the idea of "value-added" which suggested that there were a set of necessary conditions that together created sufficient conditions that determined collective behavior. The causes and effects of collective behavior were more complex and contingent that previously assumed but could be understood as the logical outcome of a specific context.

Normative conceptions of crowd behavior began to emphasize the sociability of crowds and suggested that everyday social roles and norms shape the behavior of people even when facing emergencies (Johnson 1987a, b). Normative conceptions of crowd behavior emphasize the importance of pre-existing social bonds. One normative conception is the affiliation model of crowd behavior which suggests that in threatening conditions, physical danger is less disturbing or stressful than separation or isolation, and people are motivated to seek familiar people and places. Affiliation behavior has a calming effect, keeps fear to a minimum, reduces the likelihood of "flight," makes expressions of mutual aid commonplace, and is more influential than other forms of social control (Sime 1985; Mawson 2005; Cocking et al. 2009). Cohesion and calmness is heavily dependent on the establishment and maintenance of "primary group" relations, flight affiliation is more social than risk based, and perceptions and responses are determined by proximity to attachment figures (Mawson 2005). Another normative conception is the social identity model of crowd behavior which suggests that people are able to act cooperatively in crowd events because they share a common social identity which sets normative conduct. This normative conduct exists along a spectrum from peaceful to conflictual (Reicher 1982, 1984, 1987). Rather than irrational, antisocial, or asocial behavior, it is social and affiliate behavior that usually takes place during crisis events.

In addition to social and affiliate behavior, there is also evidence of mutual aid, heroism, and self-sacrifice among groups of strangers (Chertkoff and Kushigian 1999; Proulx and Fahy 2003; Ripley 2005). This lacuna is addressed by the conception of the mass emergent sociability of crowds which suggests that social bonds can arise within a crowd of strangers based on a shared relationship to the crisis itself. The shared experience of a common external threat can become the basis for solidarity, social cohesion, and empowerment in the crowd (Drury et al. 2009a, b); and this solidarity is dynamic, meaning that it can change over the life of the crisis, with individuals increasingly identifying with the rest of the crowd, and the crowd becoming more unified (Drury and Cocking 2007). This shared social identity results in specific behaviors in which everyday norms are upheld and

social roles continue to operate; and it is both a cause of helping and coordinating behavior, as well as an outcome of crisis (Drury and Cocking 2007). Evidence from the July 7th bombings in London suggest that people in crowds generally cope well during disasters and emergencies and that crowds appear to be an adaptive source of mutual support (Drury and Cocking 2007). In short, while the contagion approach emphasizes the dissolution of social bonds, and normative and affiliation approaches stress their maintenance, mass emergent sociability considers the possibility of the creation of such bonds.

## Crowd Behavior, Panic Myths, and the Empirical Evidence

The concepts of "panic" and "flight" are often negatively associated with dispersal and evacuation events. Panic is generally defined in terms of an irrational or emotionally charged psychological state, or group response, to real or imagined external threats (Peckham 2015); and it is often linked to fear-induced "collective flight" (Smelser 1963, p. 131). Panic is often characterized as an "overwhelming sense of fear" (Quarantelli 1954, p. 269), believed to be based on "hysterical belief" (Johnson 1988, p. 8), and involving "unregulated competition" and a "loss of social control" (Feinberg and Johnson 2001, p. 270). This orthodox conception of behavior was influenced by the contagion and asocial theories; and it suggests that antisocial behavior is an inevitable response to either danger, the threat of damage to property, and the risk of death. Panic involves a fear-induced breakdown in the accepted social order, and of normal social bonds, that is often driven by insufficient time to make an informed decision, which in turn creates more danger for members of the group. Panicked people uncritically copy the antisocial behavior of others without considering the consequences, allowing their instinct for self-preservation to override normal socialization, dissolve collective bonds and social attachments, and engage in selfish and competitive strategies for personal survival (Strauss 1944; Quarantelli 1954; de Ville de Goyet 1991). These images of crowd behavior follow what McPhail (1991) refers to as "the myth of the madding crowd."

New conceptions of crowd behavior gradually emerged as these phenomena became subject to increased study by psychologists and sociologists and as anecdote and conjecture gave way to a growing body of empirical evidence based on research of actual cases. The orthodox assumptions of irrational and destructive behavior during crisis events did not accurately account for actual human behavior in the vast majority of events. Collective crisis behavior is typically socially structured and adaptive, among survivors is characterized by sociality and cooperation rather than by individualized competition, and is usually complex and highly contextual (Quarantelli 1954; Fritz and Williams 1957; Johnson 1987b; Donald and Canter 1992; Solnit 2009; Aguirre et al. 2011). Couch (1968, 1969) identified and critiqued several crowd stereotypes or myths associated with the orthodox conception, most of which he demonstrated were empirically false, present only in very specific cases, or also present in other collectives beyond crowds (McPhail 1991, 1997). Several of the leading myths are summarized in the Table 1.

Over time each of these myths has either been discredited, qualified, or circumscribed based on the nature of the crisis and the context in which the crisis takes place. The description of crowd behavior as being antisocial behavior and noninstitutionalized, and the use of negative and emotive terms to characterize its collective psychological state, seems to ignore or downplay the fact that collective behavior that is coordinated, calculated, and institutionalized can also be antisocial, emotional, and irrational and can lead to violence, destruction, and death. Crowd behavior which seems on the surface to be uncoordinated and irrational might actually be a rational and effective means for achieving some goal and represent at least tacit acceptance of shared beliefs among the crowd. Human behavior that is pathological, primitive, emotional, impulsive, irrational, delusional, and paranoid does not require a mob to manifest itself, nor does it arise only in the context of mass panic or fear-induced flight.

**Psychology of Crisis Evacuation, Table 1** Crisis myths versus empirical evidence

| Crisis myths | Claim | Empirical evidence |
|---|---|---|
| Crowds often act in an antisocial manner when faced with some stressful triggering event | Crowds are less intelligent and more driven by simple emotions than individuals. Crowd behavior often described using negative and emotive terms (LeBon 1968; Smelser 1963) | No evidence that crowds inherently suffer from any cognitive deficit. Many crowds are goal-focused. The perception of irrationality might be more reflective of the biases, prejudices, and agendas of observers and commentators (Turner and Killian 1957; Couch 1968, 1969; Rule 1988) |
| Crises bring out the worst in people | "Civil disorder" was inevitable. Rioting, looting, and interpersonal violence would be the specific manifestations (Alexander 2007; Fischer III 2008) | Helping and rational behavior, cooperation, and altruism are common to crisis-related events (Turner and Killian 1957; Couch 1968, 1969; Rule 1988) |
| Survivors of crises-related events are often stunned and overwhelmed by the experience | Survivors become passive and helpless, cannot adequately care for themselves, and need outside support to cope and recover (Quarantelli 1954; Webb 2002; Auf der Heide 2004) | Survivors commonly act as first responders and members of "therapeutic communities," carry out the bulk of search and rescue activities, and convey the bulk of injured toward medical treatment (Barton 1969; Drury et al. 2009a, b) |
| Crowds act spontaneously and are highly suggestible | The strong emotions of other people in the crowd spread like a "contagion" giving rise to widespread antisocial behavior (Park and Burgess 1924; LeBon 1968; Ross 1908; McDougall 1920) | Crowds are no more spontaneous nor receptive to the suggestions of outsiders than other groups including the authorities. Crowds are often the result of careful planning and represent organized collective action, e.g., strikes, boycotts, and protests (Couch 1968; Tilly 1993) |
| Crowds are highly destructive and capable of causing loss of life and damage to property | Anonymity leads people to feel free from normal social constraints and unaccountable for their actions, while unanimity suggests that the spontaneous and suggestible crowd is driven to behave in a mutually inclusive manner (Couch 1968, 1969) | Destructiveness and death often arises in very specific circumstances, is not restricted to crowds, and is more likely to be a result of, or response to, the behavior of the authorities. Violence is usually triggered by a small group whose intent is violence (Couch 1968; Tilly 1978; McPhail's 1994) |
| Antisocial behavior tends to come from the lower or marginalized echelons of society | Lower strata social groups do not command sufficient respect, possess sufficient resources, nor have the necessary knowledge and skills to organize others and coordinate pro-social behavior (Tierney 2006) | Misconceptions about the behavior marginalized or poorly understood groups are well-ingrained. Elite groups normally characterized what is socially normal and acceptable |
| "Mass panic" and "fear-induced flight" | Irrational fear spreads through a group of people like a contagion inducing collective panic flight (Ross 1908; McDougall 1920). Crowds react out of proportion to the actual level danger (Smelser 1963). The perception of entrapment increases likelihood of antisocial behaviors (Johnson et al. 1994) | Mass panic and fear-induced flight are uncommon. People are more likely to remain in place, move to familiar places, or stay with or move to familiar people (Drury et al. 2009a, b) |

This is not to suggest that people in a crisis do not "panic" nor feel "fear," nor to suggest that the stereotypical panic reactions never happen; however, these feelings only rarely emerge as selfish, competitive, injudicious, antisocial, and behavior. It is important to note that the relationship between a state of fear or panic and fear-induced flight is not necessarily a direct one, nor is it an inevitable one. When people are surveyed or interviewed after a crisis, they usually report feelings of fear, and not panic-stricken behavior by themselves or others, consistent patterns of solidarity in the face of a common external threat, and communities working cooperatively and collaboratively to restore to recognizable shapes their physical environment and their culture (Drury et al. 2013). Where the conditions for mass panic and fear-induced flight are present, or these behaviors start to emerge, they are usually taken care of by various informal mechanisms of social control (Rosengren et al. 1974; Quarantelli 1981). The concepts of mass panic and fear-induced flight are poor predictors of, and explanation for, death and injury in disasters and emergencies and are therefore of limited scientific value (Rogsch et al. 2010).

Despite the empirical evidence against the orthodox conception, the myths about mass panic and fear-induced flight persist, often reinforced in popular culture by the inaccurate reporting in the mass media, by apocalyptic themes in films and novels put out by mass entertainment, and by the rhetoric of politicians and public officials (Clarke 2002; Quarantelli 2002; Tierney 2003; Fischer III 2008). A few examples illustrate the persistence of these myths: popular accounts of the Johnstown Flood of 1889, the Galveston hurricane of 1900, and the 1938 Orson Welles radio dramatization of War of the Worlds; media accounts of the 1973 Swedish radio dramatization of a fictional meltdown at an unfinished nuclear reactor in Barseback; and initial official rhetoric surrounding Hurricane Katrina in 2005 (Cantril 1940; Rosengren et al. 1974; Thevenot 2005; Miller and Goidel 2009). Also, many leading sociology textbooks – to which policy makers, emergency managers, law enforcers, and journalists are exposed in their training – contain passages endorsing one or more of the panic myths (Park and Burgess 1924; Schweingruber and Wohlstein 2005).

The continued use of the term "panic" may be more related to its rhetorical, rather than scientific, value where it is used to convey the seriousness of an event, to exaggerate impending danger, to socially and symbolically construct a desired post hoc image of a crisis, and thus to influence an audience in a way that serves elite interests (Quarantelli 2002; Dawkins 2006; Hoffman and Ford 2009). There are numerous ways in which the perpetuating of the panic myths serves elite interests to distract from their culpability in engineering, management, policy, institutional, and organizational failure and to cover elite panic (Clarke and Chess 2008; Challenger and Clegg 2011); to justify restrictions on public access to information and increase centralized crisis management (Tierney 2004, 2007); and to encourage members of the public accept the expansion of state powers, the curtailing of civil liberties, and increasing of surveillance of its citizens, as happened in many Western countries after the terrorist attacks in the 2000s (Davis and Silver 2004). The orthodox conception of crowd behavior therefore shows how power often works in disasters and emergencies but with negative consequences.

## Crowd Dispersal and Evacuations

A wide variety of disaster and emergency situations may cause or require a dispersal or an evacuation (egress), although in some crisis events the best course of action is to remain in place. When an egress does take place, it may be spontaneous or planned, or it may be chaotic or orderly, but in all cases, it is psychologically stressful and places considerable pressure on people's decision-making abilities. This is especially so when the threat is eminent, the number of evacuees is large, and escape routes are limited. In such circumstances it is appropriate to experience feelings of fear (Drury and Cocking 2007). The unpredictable and varied circumstances surrounding a crisis will therefore greatly affect how quickly and safely people move away from a

hazard, or an impending or ongoing disaster or emergency, and determine if an orderly egress devolves into mass panic and fear-induced flight.

For an egress to devolve into fear-induced flight, people must perceive the following circumstances: the threat of entrapment in a confined space, the possibility of escaping the threat, a limited number of escape routes that appear to be rapidly closing, and a belief that flight seems to be the only way to survive and that no external help will be forthcoming (Rosengren et al. 1974; Heide 2004). These circumstances, when combined with one or more further contributing factors, will determine if aggressive conditions will emerge, the degree of jam of evacuees, and the probability of successful escape. These contributing factors include crowd size and crowd density, perceptions by evacuees about the seriousness of a threat, mechanisms for warning of a threat, the physical environment in which the emergency takes place, the psychological and social characteristics of individuals and the crowd, the managerial policies and controls in place to deal with an emergency, the volume and consistency and credibility of information, and the familiarity of evacuees with the location and its people (Canter 1980; Bryan 1982; Sime 1980, 1983, 1995; Johnson 1987a, b; Johnston and Johnson 1988; Keating 1982; Donald and Canter 1990).

The degree of group cohesion and calmness during egress is connected to the maintenance of existing, or establishment of new, "primary group" relations, and it is usual to attempt to maintain or reestablish proximity to attachment figures. Strong primary group relations are not always beneficial to an efficient and effective egress. People fleeing from dangerous situations tend to remain guided by social relationships and roles; they exhibit altruistic behavior; and they move toward familiar people and places rather than move away from the threat; however, this pro-social behavior will often mean people fail to recognize the urgency of the situation and act quickly enough and with purpose, so that collective flight may be delayed and the chance of survival reduced (Sime 1984; Drury and Cocking 2007). Studies of evacuations suggest that people are often unwilling to deviate from what is familiar, even in the face of danger: people tend to leave venues by the way they entered, or through familiar routes, even with better exits available; and the propensity for flight is more social than risk based, leading people to under- or overestimate danger and respond suboptimally (Donald and Canter 1990). The order and regulation of social relationships and roles should impose control on people, and interdependence and cooperation should generate feelings of social solidarity and promote mutual assistance; however, the availability of greater amounts of group resources slows evacuations as it changes the social perceptions of danger (Donald and Canter 1990).

There is some empirical evidence suggesting that factors such as gender, culture, social class, social influences and support, and prior evacuation experience may also affect dispersal and evacuation behavior (Riad et al. 1999; Riad and Norris 1998; Tierney 2006). Studies also suggest that different egress situations are also likely to provoke a range of evacuation behaviors among a heterogeneous crowd that gives rise to models of behavior such as competitive, queuing, herding, altruistic, and leader-following (Pan et al. 2006, 2007). The September 11th attack on the World Trade Center provides some empirical examples of a range of egress behaviors: some evacuees delayed their egress to collect belongings, save their work on computers, or go to the bathroom (Blake et al. 2004; McConnell et al. 2010); strangers stopped to help evacuate a woman in a wheelchair (Averill et al. 2005); and the evacuation of people from below the impact point was orderly, efficient, and characterized by a very high survival rate because pro-social norms were reinforced by evacuation protocols which were put in place after the 1993 bombing (Drury and Cocking 2007). These protocols were periodically rehearsed and known by a significant number of the building's occupants.

## Policy and Practice Implications of Crisis Psychology on Evacuations

The current theoretical assumption is that a heterogeneous crowd will behave rationally, normatively, and collaboratively during egress situations

which are triggered by a wide range of disasters and emergencies. Theories of individual and collective egress behavior, whether explicit or implicit, do inform policies, procedures, and practice which will in turn influence the risk of human casualties (Mawson 1980; Clarke 2002; Drury and Cocking 2007). Public officials and emergency managers need robust, empirically based, theories of human crisis behavior to help them develop balanced evacuation policies and practices that reflect the legitimate public policy and safety concerns of public officials; that reflect individual and group decision-making processes; and that reflect how people interpret official warnings and advice that influence whether, when, and how to disperse or evacuate (Riad et al. 2001).

One important result that emergency managers need for efficient and effective egress is getting people to fully comply with evacuation requests. Compliance is usually more problematic than mass panic and fear-induced flight: evacuation rates will vary widely in disaster situations depending on individual, group, spatial, temporal, informational, and hazard characteristics; and some people may evacuate even though they are not officially considered to be at risk (Riad et al. 2001; Drury and Cocking 2007; Kendra et al. 2008). Public knowledge about risks and hazards they face, and the expectations of the authorities charged with managing relief and recovery efforts, is critical to efficient, effective, and successful crowd control and egress. Disaster and emergency agencies and other public officials must practice sound information management; they must treat the public as trustworthy and cooperative partners who can be trusted with accurate information about the risks and hazards they face; they must get coherent, understandable, meaningful, and consistent information to the various audiences; they must carefully and strategically use of the media to educate and inform the public; and they must do so in a timely manner to allow the public to process the information and respond appropriately (Riad et al. 2001; Eiser et al. 2012). Individuals and communities are often more psychologically and socially resilient than the authorities give them credit; however, individual and community resilience is not unlimited (Douglas and Wildavsky 1982; Tierney 2006; Quarantelli 2008). Successful crowd control and egress requires authorities to act ethically; to be explicit, unambiguous, and sensitive in their communications; and to encourage two-way communication if they are to build and maintain public trust (Quarantelli 1984; Riad et al. 2001; Drury and Cocking 2007; Eiser et al. 2012).

Apart from the hazard itself, it has long been recognized that human factors are the major source of problems in all types of disasters and the prime factor behind mass fatalities and injuries (Quarantelli 1988). Emergency organizations have been criticized for assumptions, policies, and practices ill-suited to civilian disaster operations: the traditional civil defense type orientation involved centralization, hierarchy, and command-and-control; contingency plans were followed inflexibly; civilians were expected to respond appropriately to instructions; and dysfunctional behavior and nonfunctioning individuals were assumed to be the major source of problems (Riad et al. 2001; Quarantelli 2008). Panic, informational and cognitive overload, and bureaucratic inertia often takes place among the people in positions of power and authority tasked to manage crisis-related events (Mawson 2005). Successful disaster and emergency management in general, and dispersal and evacuations in particular, requires robust communication and coordination, the avoidance of management overload, the ethical and responsible exercise of authority, the clarification of roles and responsibilities, and the trust, moral support, and actual participation of the public in addressing the event.

## Conclusions

Current research and empirical evidence suggests that crowd behavior in disasters and emergencies is socially structured, collectively patterned, and meaningful rather than irrational or instinctive; is characteristically orderly and cooperative rather than disorderly, individualistic, or selfish; and the shared experience of danger and deprivation tends to lead to feelings of togetherness, mutual helping of strangers, altruism, and even heroism

(Drury and Cocking 2007). Even in the most life-threatening situations, people do not usually turn against each other, nor do they suddenly forget personal ties and moral commitments to members of the community. In cases of egress, mass panic and fear-induced flight are rare, and most people cooperate with each other and the authorities. In the instances were crowds descend into violence and individualistic behavior, there are usually special circumstances and triggering events beside the actual emergency and disaster. Disasters and emergencies, like other social situations, have social rules and prescribed roles, and people generally follow them (Drury and Cocking 2007).

The psychological robustness and resilience of individuals and crowds have important implications for improving disaster and emergency planning and management, for ensuring that emergency organizations cope well and act ethically, and for providing the public with meaningful support to survive and recover. Survivors can be a potentially useful resource to the emergency services to assist with response, relief, and recovery; and emergency management organizations must not inhibit the public's own natural resilience and resourcefulness (Drury and Cocking 2007). Traditionally negative perceptions of crowd behavior by public officials and the media in crisis situations need to be challenged and addressed by better education and training of emergency professionals, the public, and the media. The ability of the crowd to positively contribute during response and recovery by providing mutual aid and rescue, by coping with individual distress and panic, by coordinating and cooperating with the authorities, by taking initiatives to identify and solve immediate problems, and by playing a leadership role should not be underestimated nor undermined (Drury et al. 2013). Just as the social construction of collective psychological vulnerability has been historically used to misrepresent the behavior of the crowd and serve the interests of those in power, so too can the social construction of collective psychological resilience, civility, and cooperation be employed to reduce death and injury in crisis events.

# Psychology of Leadership

Eric K. Austin
Department of Political Science, Montana State University, Bozeman, MT, USA

## Synonyms

Bureaucracy and Leadership; Group and Individual Leadership; Leadership; Leadership in Organizations; Theories of Leadership

## Introduction

The psychology of leadership is the study of leadership, including topics such as organizational identity, motivation, coordination, performance management, and organization development and change through various psychological models and corresponding approaches to psychological research. These approaches examine variables including individual and group identity, perceptions, and behaviors.

At least two, potentially related, basic models of psychology and leadership are operative within the research. The first explores the psychology of leaders and inquires into how psychological traits or orientations of leaders affect their ability to improve the effectiveness of followers' or subordinates' efforts to do their jobs and accomplish their goals/tasks. The second examines the psychology of all members of the organization and the relationships among them in order to understand how leaders can leverage psychological processes to improve employee and organizational performance.

This entry proceeds by first exploring several of the dominant psychological models used descriptively and prescriptively in the study of psychology as it relates to leadership, beginning with early trait and character models of leadership, and then proceeding through behaviorist, humanist, social-psychological, psychoanalytic, and finally neuroscience and cognitive science approaches to understanding and developing

leadership. The description of each model includes an overview of its core psychological ideas and a summary of the organizational and leadership applications that have developed from it.

### Early Management Theory: Character, Personality, and Trait Approaches

As leadership, management, and organization theory emerged as a formal, systematic field of study in the early twentieth century, psychology too is still in its early stages of development. To the degree that a psychological theory of leadership existed, it took the form of what is either described as *trait theory* or *great man theory*, which both assume that leaders are born with the requisite characteristics or traits to lead. These theories tend to emphasize traits including heroism, self-confidence, courage, and extroversion as the basis of effective leadership.

Although it does explicitly adopt a psychological model of leadership, classical and scientific management does embrace a basic model of behavior, which entails a corresponding theory of mind. The rational or economic model of mind and behavior dates back as far as Adam Smith and the Scottish Enlightenment, but its integration into organizational settings emerges most influentially with Fredrick Winslow Taylor's Principles of Scientific Management, in which he argues that subordinates' basic rationality or pursuit of utility can be used by managers and leaders to maximize organizational performance.

One of the key representatives of the shift toward changing the emphasis and growing recognition of the more complex human elements of organizations, including an essential role for leadership, was Chester Barnard (1938). His thinking marks an important shift away from the classical models in that he emphasizes individual, small group dynamics, systems, communications, and decision-making as important concepts. Barnard also advanced the thinking about the importance of informal groups and emphasized the role of leadership by saying that leadership cannot be solely exercised by those at the top and not only at their discretion. Leadership is dependent upon the willingness of workers to follow, accept, and respond to the direction. He suggested that followers have a great deal to do with the nature of leadership. Barnard pictured motivation as a matter of interactive exchange of capacity rather than the narrow pursuit of self-interest. In such interactive relations, leaders and followers have something to offer the other and seek to negotiate these roles. In shifting attention away from narrowly rational organizational structures and behaviors, and to the importance of cooperation and interactive relationships, Barnard represents an important bridge to what would become the human relations movement.

As a part of that shift, Barnard is interested in issues of persuasion and cooperation based on an assumption of some level of rationality in individuals. Workers are not necessarily uneducated, uncalculating masses, but not wholly rational either. As such, they are also affected by social pressures. Like the great man and trait theories described above, Barnard suggests that leaders had better attributes for management. Labor, according to Barnard, wants and perhaps even needs to be lead and will recognize fulfillment through the success of the organization. Leadership is connected to the satisfaction of desires, and those who were successful were characterized by intelligence, ability, enthusiasm, honesty, and fairness.

Barnard's depiction of leadership is illustrative of the reflectivist character of this psychological approach to leadership, in that his depiction of the necessary leadership traits is developed largely based on his reflection on his own capacity for and success as a leader. One difficulty of trait and great man theories is that observationally, the link between these traits and effective leadership is more difficult to identify and verify in systematic ways. That is, if traits are causal features of leadership, how do we explain those who possess those traits and are not leaders or are not effective leaders? Similarly, how do we explain those individuals who are effective leaders who do not possess those traits?

### Behaviorism

Developing in part because of the problems reflectivist psychological theory had in accurately

predicting behavior, behaviorist theories adopt a more systematic, empiricist approach to examining behavior and inductively attributing causes to that behavior. Behaviorists believe that behavior itself can be objectively and scientifically measured rather than being inferred based on internal and subjective mental causes like thinking and emotion. As a result, behaviorists emphasize carefully controlled, observational methodologies. Critically, though, behaviorists also assume that, rather than being innate or inherited, effective behaviors can be intentionally developed through conditioning.

Moving beyond Pavlov's notion of classical conditioning and natural reflexes, B. F. Skinner was among the first behaviorists to turn his attention to more complex voluntary and involuntary forms of behavior and developed the approach known as *operant conditioning*. Operant conditioning functions on the assumption that behaviors, and changes in behaviors, result from an individual's response to stimuli experienced in the environment. Most simply, positive stimuli will reinforce and increase behaviors and negative stimuli or punishment will decrease the frequency or prevalence of behaviors. Leadership, working from a behaviorist orientation, suggests that supervisors cannot directly cause behaviors among subordinates, but rather sets the circumstances or provides the stimulus for behaviors to occur or appear (Davis and Luthans 1979).

While early behavioralist research, especially using classical and operant conditioning approaches, attempted to proceed by focusing only on observable phenomena, subsequent work, described as cognitive behaviorism, recognized the possibility that unobservable or covert cognitive processes such as self-instructions, self-evaluation, and other thoughts and images have an influence on the relationship between the actor and environment.

## Humanism

Unlike the more narrowly observational methods used by behaviorists, humanist psychology works from the assumption that behavior is shaped by inner feelings such as self-concept, and emphasizes studying the whole person rather than what humanists see as overly reductionist methodologies that measure only behavior.

It is this attention to employees and their normative value in the organization that appears clearly in the work of Abraham Maslow, perhaps the most well-known psychologist beyond Sigmund Freud to make a contribution to management and organization theory. Maslow's observational research found behavior which suggested that a prioritized or hierarchical set of needs were involved in shaping what humans do. Based on this recognition, together with the addition of the concept of self-actualization, he developed the widely known *hierarchy of needs*. Beyond the profound impact Maslow's theory has had on American psychology, the same thinking has influenced thinking about leadership and management in organizations as well. Drawing on his observations at a small manufacturing firm, the results of which were published in his book *Maslow on Maslow* (1998). The basic idea of Maslow's hierarchy – physiological, safety, social, esteem, and self-actualization, respectively – as applied to organizations is that humans pursue the needs described in the hierarchy and do so in a particular prioritized way. That is, if one's basic or physiological needs haven't been met, the individual will not consider or pursue his safety needs. As a question of leadership in organizational settings, the idea is that if organization can be managed such that many, if not most, of the individual's needs can be fulfilled inside the organization, then that individual will be able to focus his or her energy on his or her job duties. If leaders can arrange for more of the employee's energy to be directed to job duties and tasks rather than need fulfillment or if needs can be met through the work of the organization, then the organization will benefit and organizational performance will be higher.

Working along a similar line of inquiry, Frederick Herzberg (1959) recognizes that there are attributes of organizational practice and experience that can serve as powerful positive motivators for individual performance, and there are also job dissatisfiers, or *hygiene factors*, which can inhibit performance. For Herzberg, satisfiers or motivators follow closely with those that emerge

from motivational theories described above. These include opportunities for development, achievement, recognition, and so forth. The addition of Herzberg's hygiene factors reveals the importance of organizational structures that are, to a large degree, outside the control of the individual but that nevertheless have a substantial impact how individual workers feel about and performs. Hygiene factors, according to Hertzberg's research, include things like company policies, working conditions, structural or authority relationships with supervisors and subordinates, and, interestingly, salary. Herzberg's survey research found that contrary the position generally taken by rationalist management theorists, salary functions as a hygiene or dissatisfier factor rather than a motivator. That is, when salary was a concern for workers, it was associated with problems such as perceived unfairness or inequities in the salary system and its administration. In the cases where salary was mentioned in comments about motivation or satisfier factors, it was typically connected to factors of achievement and recognition rather than being a motivator in and of itself.

Hertzberg's consideration of an alternative and more complex model of motivation is particularly important in revealing that operationalizing motivational factors, especially hygiene factors such as compensation, is not just a matter of finding the optimal level where it becomes a positive motivator. More broadly, the humanist picture of leadership that is attuned to both motivators and hygiene factors is especially useful in public organizations where often the work is challenging in contextually very different ways than in private, for-profit settings. Because sources of motivation are different and often the very work that one does in the public sector comes with inherent public perceptions, it is important for leaders to note that the dynamics of any specific setting can dramatically influence the dynamics of motivation.

## Social Psychology and Sensemaking

The next approach draws on social rather than individual psychology. Social psychology is the subfield of the discipline that deals with social interactions, their causes, and their effects. Within the subfield of social psychology, this section looks specifically at Karl Weick's notion of "sensemaking" as a way of viewing the patterns within and factors that shape social relations organizations. Weick's depiction of the psychological processes of sensemaking involves more than a dozen of factors that are operative for most individuals and social groups (1995). Weick (1993) also recognizes that sensemaking has a critical role to play in the dynamics of leadership and organizational operations in that organizations are susceptible to sudden losses of meaning. That is, organizations can suffer what he calls cosmology events or vu jade as a sense that, "I've never been here before." Organizations and individuals within them can find themselves in situations that are totally out of the ordinary.

Weick proposes a social-psychological model of sensemaking as an alternative to the formal situational analysis and decision-making that entails routinized, rational, or boundedly rational decision-making described by Herbert Simon and others. Instead, Weick's social-psychological model of sensemaking advances a different way of conceiving how we come to understand organizational circumstances and has implications for the conceptualization of leadership.

Weick shifts attention from how information is acquired and analyzed, and by which decisions are made, and instead emphasizes the psychological character and development of shared meaning in organizations. He suggests that much of the activity in organizations is really an effort at rationalization or making sense of where we are and what we are doing at any point in time and working to fit available data into existing frameworks. When the data no longer fit, there's a breakdown in sensemaking.

Two of the central factors of sensemaking are that it is grounded in identity construction and it's social (Weick 1995). As such, the *role structure* that exists among members of an organization is critical. It also reverses the traditional understanding of group dynamics by suggesting that panic causes groups to break down rather than vice versa. Working, in part, from Freud, Weick (1993) argues that as the space between individuals and their roles becomes convoluted, then panic will ensue.

In the face of threats to sensemaking, there are mitigating strategies and structures that, when used by official and informal leaders, can reduce organizations' vulnerability and improve their resilience. The use of *improvisation and bricolage*, or the capacity to generate alternate courses of action based on available and perhaps unrelated knowledge, is one strategy. Weick's argument is that the collapse of role systems can, in part, be overcome in the presence of individuals who have the ability to identify creative solutions. He also suggests that organizations can develop *Virtual Role Systems* wherein each member of the group simulates the leadership roles and identifies "escape routes" or alternate courses of action. A third element, *Wisdom*, has to do not with knowledge of particular facts but is instead an attitude taken toward knowledge that includes skepticism or hesitancy no matter the extent or strength of one's values, knowledge, skills, information, and so forth. Finally, *respectful interaction* with others builds relationships based on trust, honesty, and self-respect. Such relationships contribute to sensemaking through the synthesis or the creation of meaning that can be the basis of actions and the recognition that such interaction changes the parties to it.

In addition to these attitudes, Weick argues that organizations can adopt certain structures that will enhance its resilience and enable it to cope with situations that will cause sudden losses of meaning. First among these structures is the capacity for *communication*. Regardless of the character or nature of the group or its structure, verbal and nonverbal communication has to be continuous and allows for the constant creation and refinement of meaning in the context of the work. Weick also emphasizes *developing frameworks* around which we create meaning. In doing so, a positive feedback loop is created wherein the meaning that is created then reinforces the existing framework. While there is a risk that this positive feedback can build to the point of dysfunction and disconnection that can tear down the group, Weick suggests that it can be balanced by giving more attention to the social or both formal and informal relationships. That is, by giving more attention to the relationships that have been created, puzzlement regarding the nature of the situation can be reduced.

Leadership approaches, utilizing Weick's model of sensemaking, understand organizations as being more or less socially constructed. The dynamics of such organizations are best understood via a social-psychological approach. More broadly, social psychology describes the relational dynamics that impact the functionality of groups and sets out to prescribe courses of action that are effective.

## Psychoanalytic Theory

A fourth psychological framework for both studying and enhancing leadership draws on psychoanalytic theory. Although there are important distinctions within psychoanalytic approaches to leadership, all psychoanalytic models have evolved from the seminal work of Sigmund Freud and all share a model of the human behavior that assumes a separation of the conscious from the unconscious mind.

Work drawing on the research and theory of Carl Jung is among the most developed and influential within organizational studies. Jung (1971) developed a theory of personality types that breaks human personality into four discrete elements, each of which functions along a continuum. The first element, the introvert/extravert domain, describes individuals' orientation toward social settings with respect to where they draw or expend energy. The sensing/intuiting element designates how individuals perceive the world around them and the thinking/feeling how one judges or assesses that world. The final element, judging/perceiving, reflects one's orientation toward the other world with respect to how they are likely to take action – individually or within groups. Where one falls along each continuum and the interplay of the four elements determines or frames how humans perceive and interpret the world around them and, thereby, structures how they behave. Jung's theory suggests that while people have a dominant type that becomes fairly stable over time, they also have an auxiliary function that provides balance, and that it is possible for people to develop or enhance nondominant elements of their personality type.

In organizational settings, personality type has been used to examine aspects of leadership including communication, supervisory style, approach to personnel relations, and other factors. Several Jungian-type indicators, including the Myers-Briggs Type Indicator (MBTI), Keirsey Temperament Sorter, and Singer-Loomis Type Indicator, have been developed to assess personality types and have been used fairly extensively in organizational settings. Early research into the validity and efficacy of Jungian typology in organization settings was mixed (Gardner and Martinko 1996). More recent work (Thomson and Gopalan 2005) has found that personality types affect the sorts of behaviors leaders believe to be appropriate under different conditions and that those beliefs translate into actual behaviors. Another work (Hautala 2006; Brown and Reily 2009) has shown a relationship between leaders of certain personality types, especially those tending toward extraversion rather than introversion and intuition rather than perception, as having a stronger sense of supporting transformational leadership efforts.

Another quite distinct approach to considering leadership and organizations from a psychoanalytic perspective draws on the work of Jacques Lacan. Lacan, while retaining the notion of the unconscious as being a key driver of human behavior, breaks with Freud and Jung in presenting a model that understands the mind and behavior as being shaped by the processes by which language is acquired during childhood. According to Lacan, language, as well as other variables like culture, produces a set of structures that frame and shape behavior. Because language and culture are shared within a society, these factors not only shape individual behavior, but they become embodied in social institutions like law and policy as well. Lacan also differs from his predecessors in that he made what is known as the "linguistic" or "postmodern" turn, which rejects the idea of absolute truths and instead adopts an understanding of truth as being socially constructed.

This characterization of truth and knowledge has implications for how we conceive of and approach leadership. For example, if we reject the notion that there is a finite body of knowledge that can be compiled and acted upon by authoritative or knowing figures in organizations, then it may be necessary to shift to alternative conceptualizations of activities like leadership, decision-making, and communications.

McSwite (2003), drawing on Lacan, describes the concept of *refusal* in organizational settings and a very different model of leadership that results. To be clear, McSwite's refusal is not a "take my ball and go home" response that results in disengagement or even departure from the organization. Rather, it is the refusal to grant deference or privilege solely to formal expertise or authority derived from traditional depictions of leadership, while at the same time remaining fully engaged in and committed to the work of the organization. This form of refusal is the recognition that there are structural or role necessities associated with productive activities in large, divisionalized organizations and a simultaneous refusal to allow authority or knowledge to rise to the level where it precludes alternate forms of wisdom or other collaborative contributions to organizational processes. McSwite argues, following Lacanian psychoanalytic theory, that the linguistic framework which gives a sense of order and shape to the world also assumes, and repeatedly reinforces, the importance of having a leader, a man of reason, or one who both knows and is in control. The problem, in an increasingly diverse, complex, and rapidly changing workplace, is that control is an illusion. If knowing in absolute terms is undermined, then control based on the ability to act from knowledge collapses as well. An example of an alternative organizational strategy that de-privileges structural elements like hierarchy and privileged knowledge and even the structural position of the leader is the use of participatory change models like action research.

The Lacanian response is one of the refusals that entails a choice to see the organization for what it is; refuse to grant deference to constructed loci of knowledge, authority, and claims thereby developed; and yet remain entirely engaged with the organization and its operation. Because the symbolic order is socially constructed, refusal also prompts us to begin to recognize that we are

not radically autonomous, atomistic individuals. We are mutually created by one another in relationship to each other and to the symbolic order. It is also a paradoxical subject who is simultaneously responsible for his actions and at the same is unavoidably a product of his circumstances.

Drawing again, directly and metaphorically from Lacan, in order to come to terms with these conditions, the individual goes through psychoanalysis to recognize how those circumstances both shape his behavior and function within and at the same time stand apart from them. At the organizational level, the discourse of the analyst might look the mission of an organization, its institutional identity, or the myths and rituals that give stability and distinction. More concretely, the organization can go through a social emergent action noted above. Action research, which operates through the collective or interactive process of acquiring data, reviewing that data, and identifying courses of action, allows the organization to deconstruct its operations, identify and make sense of the dysfunctional symbolic structures, and begin to change them.

Psychoanalytic theory, whether Jungian, Lacanian, or another approach, operates based on the notion that the drivers of behavior, because they emerge from the unconscious mind, are always more than what meets the eye. As a result, the analytic strategies, as well as the leadership and organizational responses developed through a psychoanalytic approach, all set out to make the invisible visible, or to create a space for the unconscious of the organization or its members to be present. In doing so, it becomes possible to improve the performance of the organization.

## Cognitive and Behavioral Neuroscience

Neuroscience, most broadly, is the study of the nervous system, and cognitive and behavioral neuroscience is the study of how psychological functions are produced by the neural circuitry of the brain. Until recent advances in neural imaging, the brain was largely a black box, leaving researchers to infer the causality relationships based on some combination of observed behavior and psychological models. However, because of the development of functional magnetic resonance imaging (fMRI), positron emission tomography (PET), and other neural imaging technologies in conjunction with digital analysis of the imaging, scientists are now able to gain new information about brain function in real time. Insights gleaned from this research have direct implications for behavioral and social settings, leadership, and organizational operations most prominent among them. If we can develop a better understanding of the electrochemical and neural processes of the brain, we can enhance leadership practices in relation to processes including organizational learning, behavior change, transformation, and other processes. Work in this area is new and rapidly emerging, and the following examples of leadership research and practice developing out of cognitive and behavioral neuroscience are neither exhaustive nor comprehensive. They are, however, indicative of interdisciplinary efforts to enhance understanding and practice in this area.

Work being done by the Center for Creative Leadership (CCL) is notable among recent efforts to extend and apply research in this area. CCL is using neural research to understand neurofunctioning, mindfulness, and emotion to build and test leadership development interventions (Ward and Becker 2014). For example, early efforts at CCL include the use of biofeedback to support mechanisms of self-regulation within leaders. CCL builds leadership development techniques utilizing these new understandings, in which it then tests for efficacy, both in the perceptions of participants and the degree to which they can be assessed against organizational outcomes by comparison to interventions that use approaches which leverage other variables.

Another initiative uses the interconnectedness, modularity, and plasticity of the brain, and the finding that learners' sense of reality is driven by electrochemical signals, to consider leadership and learning models (Kussrow 2001). This research suggests that the physical structure of the brain, along with its electrochemical processes, predisposes the mind to learning and responding to novelty. If this holds, then the corresponding leadership response might be to develop organizational processes that leverage

these biochemical processes in support of development and change.

A final example of study in this area approaches organizational change and leadership in a different way. Rock and Schwartz (2007) combine learnings about electrochemical processes in the brain, with the quantum phenomenon, the quantum Zeno effect, to highlight how mental focus manifests in the brain and, in so doing, shapes learning, perception, and identity. This understanding of the intersection of quantum and psychological processes can then be leveraged to establish more effective learning processes in the classroom, the workplace, and beyond.

## Conclusion

The psychology of leadership has been formally and systematically developing for more than a century at this point. Research has evolved into areas including the behaviorist, humanist, social-psychological, psychoanalytic, and, most recently, cognitive and behavioral neuroscientific approaches described here. Each approach has, in its own way, contributed both to a better understanding of and practices for leadership in organizations. Working from the premise that leadership, at its core, has to do with the ability of one actor to influence the behavior of other actors, research in psychology, which seeks to better understand functions of the mind and their relation to behavior, will continue to be influential in leadership studies.

# Psychology of Talent Management, The

James Kwame Mensah
Department of Business Administration,
University of Professional Studies, Accra, Ghana

## Synonyms

Employee outcomes; Psychological contract; Talent management; Talented employees

## Definition

Talent management focuses on the activities and processes that are used to identify key positions, the development of a pool of high-potential and

high-performing employees to fill these roles, and the continuous management of such employees with differentiated human resource architecture to ensure their continued commitment to the organization. Rousseau (2004: 120) defined psychological contract (PC) as "the beliefs, based upon promises expressed or implied, regarding an exchange agreement between an individual and, in organisations, the employing firm and its agents."

## Introduction

The past two decades have seen an increasing interest in talent management (TM) in the academic literature and as a central element of managerial discourse and organizational practice. Its growing significance is premised on the assumption that superior talent is a key source of competitive advantage in this highly dynamic and often uncertain market environment of the twenty-first century. This coupled with changes in worldwide demographics leading to talent supply issues have been key driving forces of interest in TM. Indeed, two articles in the Economist entitled "The Battle for Brainpower" (Wooldrige 2006) and "The Tussle for Talent" (Schumpeter 2011) claimed that organizations are much concerned about talents. Earlier scholarly research on TM primarily focus on defining and clarifying the conceptual boundaries of TM, but this has since given way to empirical studies in recent years. Therefore, it has been found that TM does matter as it is positively associated with employees' attitudes and outcomes and organizational performance, and negatively associated with quit intentions and counterproductive work behaviors.

While many business leaders, practitioners, and academics attach great value to TM, there is still little known about how TM really works in practice – the mechanisms by which TM practices produce these consequences remain poorly understood. This is what is usually referred to us the "black-box" in TM (Mensah et al. 2016). The "black-box" focuses on the critical interactions inside the complex realm of organizational TM systems that account for its positive consequences. Indeed, it is stated that psychology is a missing link between the TM systems and their consequences in that, employee perceptions, attitudes, and attributions are crucial mediators of this relationship (Dries 2013). Drawing from the social exchange theory (SET), this section attempts to explain why psychological contract (PC) fulfilment may act as mediator in the TM–talented employee outcomes relationship. Whereas SET was initially developed to examine the development and maintenance of interpersonal relationships, it has since been used to explain the nature of employee–organization relationship.

PC basically has to do with beliefs based upon promises either implied or expressed regarding an exchange agreement between an employee and organization. TM practices and talent strategy of an organization can be considered as particularly instrumental in shaping PC fulfilment and employees make sense of their employment relationship. The implementation of TM practices is related to PC fulfilment thereby inducing talent pool members to illicit the desired employee outcomes. Thus, an organization's investments in TM practices serve as a fulfilment of the PC for talent pool members which then have a strong relationship on talented employees' outcomes. In this paper, an attempt is made to examine the mediating role of PC fulfilment in the relationship between TM and employee outcomes as this is central to examining the "black box" in TM.

## The Concept of Talent Management

Academics and practitioners agree that TM continues to be one of the key challenges for organizations worldwide because it represents a source of sustained competitive advantage. However, TM research has long suffered from lack of a precise definition, theoretical support and development, and measurement frameworks for operationalization and identification. Early

definitions of TM concentrate on the individuals, but the focus has since shifted to strategic positions that drive organizational performance (Collings and Mellahi 2009). This paradigm shift led to the identification of "high impact" or "pivotal" roles to be filled with talented employees. Strategic positions are defined in terms of their potential outputs or disproportionate contribution to the organizational strategic intent. Strategic positions are not only limited to top positions, but include different levels in organizational hierarchy among functional and operational units. The key to understanding strategic positions is to take into account the contribution of the position to the achievement of the strategic objectives of the firm.

Generally, there are two approaches to the study and practice of TM – exclusive and inclusive. The exclusive approach views talented employees as an elite subset of the organization's employees as they exhibit a drive to excel, a catalytic learning capability, an enterprising spirit, and a dynamic sensor (Ready and Conger 2007). On the contrary, the inclusive approach is based on the "egalitarian" principle and that ideally, all employees in an organization have a role to play and can contribute something (Iles et al. 2010). Clearly, every individual's role is part of the overall performance of the organization; however, some individuals have rare skills that are crucial and contribute heavily to the competitiveness of the organization. Similarly, some positions are very strategic and contribute towards the achievement of organizational goals than others. Therefore, adopting an inclusive approach results in overinvestment and waste of resources when a star performer is in a position with little potential for differentiation (Minbaeva and Collings 2013).

TM has been described as important to the success of organizations, being able to give a competitive edge through the identification, development, and redeployment of talented employees. Contemporary TM research has focus on the individual level and found that TM contributes to employee outcomes such as satisfaction, commitment, OCB, task performance, and reduced turnover intentions (Mensah et al. 2016). However, TM especially the exclusive approach is likely to have some negative consequences. It may discourage, demotivate, frustrate, and cause dissatisfaction and jealousy of those employees who are not in the talent pool, resulting in lower productivity or increased turnover. Similarly, talent label may lead to arrogance and complacency, promote inequality, and exclusion from the TM pool could be interpreted as somehow inferior, which might lead to lower self-efficacy. Indeed, the overemphasis on individual performance diminishes teamwork and creates a destructive internal competition that hinders learning and the spread of best practice across the organization.

## Psychology: A Psychological Contract Fulfilment Perspective

PC has gained increased attention because it is an important concept in understanding the exchange relationship between organizations and their employees. The origin of PC theory can be traced to the work of Argyris (1960), Levinson et al. (1962), and Schein (1965). However, recent use of the concept stems from Rousseau's (1989) seminal work. PC comprises of the beliefs employees hold concerning the terms and conditions of the exchange agreement between themselves and their organizations. PC is unwritten and hence not necessarily shared by the other party to the exchange, what is termed perceptual (Rousseau 1989). Explicitly, PCs are comprised of the obligations that employees believe their organization owes them and the obligations the employees believe they owe their organization in return. Accordingly, different views are held by employees and employers on the content of the PC and the extent to which each party has fulfilled the mutual obligations of the exchange.

A central premise of the PC is the notion of reciprocity whereby employees reciprocate their employer subject to how well they have been treated – PC fulfilment, breach, or even violation. A composite measure of PC uses content-specific

items which can be categorized as transactional and relational (Rousseau 1990). Transactional content refers to specific, monetizable exchanges over a limited period, while relational content refers to long-term exchanges that maintain the employee–employer relationship (Robinson and Rousseau 1994). PC fulfilment reveals an employee's perception that the organization has fulfilled its side of the contract (Henderson et al. 2008). Empirical research has established a relationship between PC fulfilment and individual performance variables such as neglect, intention to quit, satisfaction, organizational citizenship behavior, turnover, intention to remain, loyalty, and voice (Robinson and Rousseau 1994).

Generally, PC develops at key moments in the employment relationship, such as recruitment, performance appraisal, training, and compensation discussions and outcomes or during events where organizations express plans for the future. Human Resource departments of organizations, through their policies, practices, and actions aimed at managing and shaping the employment relationship, are therefore considered to be particularly instrumental in the shaping of PC. Indeed, HRM has the task to create and maintain PC between organizations and their employees, where each HRM practice represents a choice by the organization about what it expects from its employees and what the employees can expect in return (Sonnenberg et al. 2011). Therefore, as part of efforts to open up the black box of TM, the concept of PC fulfilment could be used to examine how TM practices send signals that are relevant to talented employees which in turn generate talented employee outcomes.

## Talent Management: What Has Psychology Got to Do with It

A large body of research has documented that academics and practitioners agree that TM continues to be one of the priorities for organizations worldwide. While the importance of TM practices is now well accepted, there is insufficient understanding of how they work in practice (Thunnissen 2016). In order to advance the field, Dries (2013) challenged scholars to bring in literature from the field of psychology. In response, this section argued that PC fulfilment may act as mediating variable in the relationship between TM practices and talented employees' outcomes. The state of PC in terms of fulfilment or breach is of interest to the extent that if the theoretical predictions hold true, organizationally desired outcomes will result from contract fulfilment by the employer whereas contract breach by the employer is likely to lead to negative responses. Findings from the PC literature showed that fulfilment of employer obligations will be reciprocated and this reciprocation may take the form of performance, commitment, satisfaction, OCB, reduced turnover, and reduced counterproductive work behaviors.

TM practices can be seen as an investment in a long-term and stable relationship with an employee. Therefore, an organization's investment in TM practices generates a higher emotional involvement and more mutual interdependence between the talent and the employer. Thus, whereas TM may lead to talented employee outcomes, it is the perception of PC fulfilment that would generate an obligation on the part of talented employees to reciprocate their employer. In other words, the more talented employees perceive the organization as fulfilling their promises and obligations, the more likely they will display positive outcomes. This accounts for the importance of PC fulfilment in the TM and employee outcomes relationship. Indeed, the TM process is of significance to the talented employee in two ways. First, the inclusion in a talent pool is an indication of the employer's attempt to fulfil the PC. Second, the favored individual recognizes differential treatment and an investment in the development of their talent and career as an indication that their contribution is valued and the fulfilment of the PC (Sonnenberg et al. 2011). Thus, TM practices such as identification, selecting, developing, appraising, motivating, and retaining signal a fulfilment of the organizations' obligations in the contract.

Theoretically, SET provides a useful lens through which to understand the mechanisms involved in how talented employees interpret and react to TM practices. From the perspective

of SET, talented employees may see organizations' investment in TM practices as an indication of their employer's commitment towards them, signaling future opportunities in the organization. Thus, when organizations invest in TM practices, talented employees interpret this as organizational support and will reciprocate with positive employee attitudes and outcomes. Scholars have offered explanations of SET that defines TM as signals of organization's willingness to invest in talented employees (Mensah et al. 2016), which subsequently impact the PC fulfilment (Sonnenberg et al. 2014). From the above explanation it is argued that PC fulfilment may be valuable in explaining the TM–employee outcome relationship.

## Implications and Recommendations

The above discussion has implications for human resource managers. First, managers must institute communication mechanisms that inform talented employees about the availability, content, and focus of TM practices to ensure that the desired results are achieved from talented employees. This is perhaps because TM practices when communicated to talented employees help develop better understanding of organizational signals while at the same time implying the fulfilment of the PC on the part of the employer (Sonnenberg et al. 2014). Indeed, given the strategic intent to manage talent as a competitive resource, top management are expected to be highly involved in governing and communicating intentionally regarding this highly visible competitive activity.

Second, managers need to be careful about what promises and expectations they create with talented employees. Care must be taken by managers at the beginning of the employment relationship or at the time of admitting high potentials into the talent pool to firstly establish and agree to a fair PC that would benefit both parties in the employment relationship. Indeed, an entry-level survey can be used to identify their initial expectations and align them, thus creating a fair PC that would benefit both parties in the employment relationship. Since expectations may change over time, monitoring and aligning expectations should be done on a regular basis, perhaps half-yearly. This also includes the need to create environments that are supportive of employees' PC needs as far as possible. Third, organizations and their agents such as managers and supervisors should be transparent and communicate effectively with their high-potential employees about the promises, business situations, and other factors that may influence or limit their ability to fulfil their promises to their talented employees. This also implies that in situations where there has to be changes in the employment relationship, employers should seek to renegotiate the contract and thereby create new terms that are reflective of the new employment conditions.

## Conclusion

TM practices do not only have a direct positive effect but also an indirect effect on talented employee outcomes via PC fulfilment. Management should therefore endeavor to understand and fulfil the expectations of talented employees so that they can reciprocate with positive outcomes. It is also imperative for management to communicate the availability and content of TM practices, and provide information on how the organization seeks to fulfil their part of the PC. This paper contributes to the TM literature by bringing an important mechanism from the field of psychology, PC fulfilment. Therefore, this paper links the two streams of fields together to show that PC fulfilment is a psychological mechanism through which TM practices illicit positive talented employee outcomes.

## Definition

Obstetric fistula refers to a medical condition characterized by an abnormal opening in the vagina and the bladder or rectum, thereby leading to an incessant leakage of urine and/or feces.

## Introduction

Obstetric fistula is one of the medical disabilities troubling women (GHS 2015). It is a medical condition that involves an abnormal opening between the bladder and the vagina (vesicovaginal fistula) or between the rectum and vagina (recto-vaginal fistula), or both, leading to uncontrolled leakage of urine and/or feces caused by prolonged, obstructed labor, without access to timely, high-quality medical treatment.

Globally, it is estimated that more than two million women are living with obstetric fistula (vesico vaginal fistula [VVF]) with an additional 50,000–100,000 new cases diagnosed each year with at least 33,000 of these cases among women and girls in sub-Saharan Africa (SSA) (WHO 2014). It is also estimated that 30,000–90,000 new cases develop each year in Africa alone (WHO 2014). Also, more than two million young women live with untreated obstetric fistula in Asia and in sub-Saharan Africa (UNFPA 2002; Vangeenderhuysen et al. 2001).

Obstetric fistula is a severe condition which can have debilitating ramifications on a woman's life (Wall 2006). Generally, the disorder mostly results to pains and disability among patients (Lewis and De Bernis 2006), symptoms of constant leaking of urine and feces, infections, bladder stones, and infertility (Rochat 2010), depression and emotional loss (Khisa et al. 2011), loss of dignity and self-identity, and interrupts social roles among women (Mselle et al. 2011). Besides social stigmatization brought about by the condition, it also poses a threat to the women while imposing constraints on their socioeconomic activities (Wall 2006; Khisa and Nyamongo 2012; Roush 2009; Bangser 2006).

Women who experience obstetric fistula suffer constant incontinence of urine or feces or both leading to shame, anxiety, social segregation, and other health and social problems. Obstetric fistula victims often experience feelings of powerlessness, physical injury, emotional breakdown, depression, divorce, erosion of social capital, and loss of healthy years (WHO 2014). The condition is treated by corrective surgery but in spite of the successes recorded from corrective surgery, the victims continue to suffer from social isolation, and gaining entry into their disrupted social networks is often a long and arduous journey (Khisa and Nyamongo 2012). The condition affects marital and family stability as most often, and divorce and separation often occur following the onset of the illness (Roush 2009; Yeakey et al. 2009). This further aggravates the already worst lives of women with the condition (Ahmed and Holtz 2007; Roush et al. 2012).

Obstetric fistula remains a public health issue in sub-Saharan Africa and Asia; its consequences have a devastating impact on the lives of those affected (Wall 2006; Abrams et al. 2010). In sub-Saharan Africa and other developing countries, women and girls continue to endure lives of shame and incredible suffering because of this preventable condition, and not enough hospitals exist for them to receive the surgery that can cure them (AbouZahr 2003).

The complexities surrounding obstetric fistula requires further investigation to improve understanding of women's experiences and to assess whether holistic approaches may enhance their quality of life (Maulet et al. 2013). As such, a research on such a crucial health condition is much needed to enhance a holistic care approach. Exploring and describing the experience of obstetric fistula patients and sharing with individual full stories of their own feeling will fill the gap of baseline data, information, and stories of the occurrence, severity, consequence, and impact of this condition among Ghanaian women.

Discovering and documenting the plight of women with obstetric fistulas in their own voices excavates insight into the nature of this demoralizing problem and thus assists as a call for policymakers concerned with reproductive health to discourse the complex issues that propagate this preventable condition. There is now a growing literature on the period following corrective surgery albeit few studies examine their social reintegration (Molzan Turan et al. 2007; Yeakey et al. 2011). Despite the growing population of obstetric fistulas in sub-Saharan Africa (Murk 2009), the physical, psychosocial, and economic consequences suffered by those affected remain largely unexplored (Wall 2006).

A total of 1538 women have been diagnosed as having obstetric fistula (vesicovaginal fistula (VVF) between January 2011 and July 2014 in Ghana and the Ashanti region; the focus of this study recorded 295 cases representing 19.2% is the second highest in Ghana between this

period (GHS 2015). The consequences of obstetric fistula differ from country to country and from community to community. The author attempts to add to this growing corpus of literature by exploring the psychosocial consequences of obstetric fistula among women with the condition in Ghana.

## Methods

### Study Design

This research study was conducted in Ghana. Study participants were recruited from five (5) hospitals. They comprise the Okomfo Anokye Teaching Hospital (KATH), Manhyia District Hospital (MDH), Kwame Nkrumah University of Science and Technology (KNUST) Hospital, Tafo Government Hospital, and Suntreso Government Hospital. All these health facilities are located in Southern Ghana, specifically in Kumasi. According to the Ghana Statistical Service (GSS 2013), the region is the second most populous in Ghana. The selected health facilities are health facilities that are equipped with the required technology and adequate human resources to attend to obstetric conditions. The study design was a cross-sectional institution-based qualitative descriptive research. Fraenkel et al. (2011) posit that a cross-sectional design entails collection of data from a sample drawn from a specific population. It aids the researcher in collecting data in just one point in time. In addition, surveys are important in research and have been found to be useful in describing the characteristics of a population under research since they allow the researcher to ask individuals to describe the existing phenomena (Fraenkel et al. 2011; Kathuri and Pals 1993).

### Study Population

The study population consisted of women who have been living with obstetric fistula, their families as well as health professionals (nurses, midwives, and medical doctors). Participants were targeted because it was expected that all had knowledge or insights into the condition and as such could contribute to gathering relevant data for assessing the consequences of the condition on patients, and as well contribute to offering remedies through recommendations, to overcoming the challenges. This was intended to help the study draw much information from both patients and practitioners. It is believed that this would contribute to gathering a holistic, comprehensive, representative, and concise as well as a well thought through data.

*Participants for the study were selected based on this inclusion criterion:*

(a) Participants must be obstetric fistula patients
(b) Participants must be proficient in a local Ghanaian language, English, or both
(c) Key informants must have a relationship, either as a professional health practitioner or a relative to obstetric fistula patient
(d) Patient must be 18 years or more
(e) Participant must be an attendee of any of the selected health facilities

*Participants' exclusion was based on the following criteria:*

(a) Obstetric fistula patients who were reluctant to participate in the study
(b) Obstetric fistula patients less than 18 years
(c) Obstetric fistula patients outside of the selected health facility

### Sample and Sampling

The purposive nonprobability sampling technique was used in the selection of women with obstetric fistula. A total of 50 participants (women with obstetric fistula) constituted the sample for this research study. These were women who had the condition and had undergone a corrective surgery but were reporting to the various hospitals for review. Also, another sample of ten (10) key informants comprising of health professionals (nurses, midwives, and medical doctors) and relatives of women with obstetric fistula were also selected. Overall, a total sample of sixty (60) participants was involved in this seminal study. The sample for the study was achieved at the point of reaching saturation.

## Data Collection Methods

Patients with obstetric conditions were interviewed and key informants were also interviewed using an in-depth interview instrument. Specific participants recruited for the key informant interview included certified nurses, medical doctors, midwives, and family relatives of obstetric patients. The research investigators with five (5) research assistants interviewed patients in each of the five (5) health facilities and key informants with work bearing on obstetric fistula were also interviewed. Integral to the interview guide, participants were required to furnish the research team with data bordering on their individual demographic characteristics like age, marital status, level of education, number of children, and occupation. In gathering data, participants with difficulty of understanding English had the instruments explained to them in Twi (the local language which is the most widely spoken language in the study area) with the help of a professional translator. On the few occasions when the research team encountered a participant with little or no proficiency in the Twi language, a professional facilitator was engaged to assist in explaining the interview. Data were elicited using a tape recorder. This was done with the consent of the participants. All the participants were above the age of eighteen (18) years. To gather a holistic, comprehensive, representative, concise, and a well thought thorough data, key informant interviews were also conducted. Participants including relatives of patients and medical professionals were interviewed. The key informants contributed to gathering diverse opinions, which were consistent with information provided earlier by patient participants. The key informants were precisely relatives of patients and other health professionals like doctors, nurses, and midwife whose knowledge and professional insights into the condition were tapped into. Going forward, their views, relative to recommendations, were sought to make the study complete. Before our engagement with participants, the research team clearly explained the purpose of the research, procedures, and benefits as well as the associated emotional complexities to them.

## Data Analysis

Miles and Huberman's framework of thematic content analysis was employed. Miles and Huberman (1994) segmented data analysis into data reduction, data display, conclusion drawing, and verification. Audiotaped recoding of interviews had with participants were transcribed accurately and used as primary data. The audiotapes of the participants' description of their experiences were then transcribed verbatim. Once the interviews were transcribed, an overall summary was written based on the participant's responses to the interview. In transcribing, a person proficient in the medium of communication transcribed the recorded in-depth interviews with the guide of investigators field notes. Assigning much attention to details, transcripts were patiently read line by line in order to become conversant with them. Initially, codes were identified after which codes with similar discourse focus and connections were integrated to constitute subject matter themes intended to help detailed content analyses which were used. The response of the interviewees of the study, deduced from the in-depth interviews conducted, which constitutes the central narratives of this study, is representative of descriptions of their own opinions. The themes derived from the in-depth interviews were then subsequently summarized. Also, no names were associated with participants but pseudonyms. This was done to hide to ensure confidentiality and anonymity.

## Ethics

Ethical clearance was obtained from the Committee on Human Research Publication and Ethics at the Kwame Nkrumah University of Science and Technology (KNUST) before the study was conducted. Participants were given ample time to recall their experiences. The questionnaires were approved by experts who had working experience related to obstetric fistula research. The research design for all the participants was tailored to avoid gathering duplicated and irrelevant responses. To ensure consistency and minimize

inherent weaknesses, questionnaires were pre-tested on a pilot basis with a randomly sampled population from the targeted study areas. The piloted questionnaires were however not included in the final data gathered for the main research work. Key informants were involved in the survey.

## Results

### Sociodemographic Characteristics of the Participants

For the purposes of this study, fifty (50) participants with obstetric fistula were recruited in some five (5) selected health facilities. The ages of participants ranged between 20 and 51 years. A careful look at the table indicates the ages at which women developed fistula, most of the participants (48%) developed obstetric fistula at the age between 41 and 50 years. On the educational level of participants for the study, most of them (70%) had no formal education. The resident status of the interviewed women indicates that 66% ($n = 33$) were from rural areas and 34% ($n = 17$) were urban residents. With regards to the number of years lived with the disorder, it was found that most (40%) had lived with it for 7–9 years. From our field interview, it was apparent that 58% ($n = 29$) were divorced, 28% ($n = 14$) were still married, and 14% ($n = 7$) were widowed as sown in Table 1.

### Psychosocial Consequences

The participants sampled for the study clearly stated their social challenges experienced as a result of the obstetric fistula. Some of the challenges included stigmatization, isolation, and reduced or truncated general social and marital relationship.

### Marginalization and Stigmatization

Almost all participants interviewed for the research study complained of stigmatization

**Psychosocial Consequences of Obstetric Fistula: Implications for Social Work Policy and Practice, Table 1** Study participants composition

| Variable | Category | Number of Respondents | Percentage (%) |
|---|---|---|---|
| Age | 20–30 | 25 | 50 |
| | 31–40 | 10 | 20 |
| | 41–50 | 8 | 16 |
| | 51+ | 7 | 14 |
| OBF age occurrence | 20–30 | 13 | 26 |
| | 31–40 | 10 | 20 |
| | 41–50 | 24 | 48 |
| | 51+ | 3 | 6 |
| Residence | Rural | 33 | 66 |
| | Urban | 17 | 34 |
| Education level | Formal education | 15 | 30 |
| | No formal education | 35 | 70 |
| Occupation | Employed | 21 | 42 |
| | Unemployed | 29 | 58 |
| Marital status | Married | 14 | 28 |
| | Widowed | 7 | 14 |

| Yrs. lived with OBF | 1–3 | 15 | 30 |
| | 4–6 | 12 | 24 |
| | 7–9 | 20 | 40 |
| | 10+ | 3 | 6 |

from within and among members of the society. The continuous isolation in their view stems from the smell and odor brought about by the fecal and urine leakages and incontinence. The extent of the stigmatization, though pervasive, appeared varying from one participant to the other. Whereas others suffered from job losses, others complained of having been objects of social mockery owing to intolerance for the health disorder. In an interview with a participant, it was recounted that;

> *"I lost my first job because my employers thought customers couldn't bear with the smell and odour from me. I was a shopkeeper then. I had a second job and it was taken away from me because of the same problem"* (Participant 18).

Another participant in the narration of her ordeal stated that:

> *"People think I am dirty and filthy. Whenever they see me, they whisper to say that is the and smelly lady coming. Actually, before God and Man, it makes me feel bad and wants to even at times end my life by committing suicide"* (Participant 21).

Another woman said that:

> *"I cannot go to community meetings because people will point fingers at me and talk about me. My social life is now limited"* (Participant 25).

Another reiterated that:

> *"I have been home alone almost all the time because my faeces and urine all together are leaking. It is quite nasty an experience to go through. People who have little or no idea of the ailment come into contact with me and think I am unclean and filthy to be associated with. To be frank with you, I am tired of this ailment. I wish I am dead. For some time now, I have been hoping for recovery, but now, I have given up. Whatever want to happen can happen. I care less* "(Participant 9).

This theme of marginalization and stigmatization recurred throughout the narratives of key informants. Our interaction with a key informant nurse captured that:

> *"Obstetric fistula patients face a lot of problems. Close associates of theirs including family relations, husbands and even the society abandon them. They find themselves in a tight situation living a solitary life from society. It is not surprisingly most of them have psychological problems"* (Participant 22).

Another key informant who is a medical doctor said that:

> "*Obstetric fistula is more of a social and cultural problem. One of the first things that fistula patients face is the stigma from the society so they are segregated, simply because of the condition they are living with"* (Participant 16).

The foregoing interviews underscore the painful experiences that women with obstetric go through. As captured above, it is obvious from the above that they are socially sidelined and as such are unable to live a normal life and participate in social activities as well all because of the continuous urine and feces leakage.

### Isolation and Abandonment

Participants bitterly expressed their profound disappointment with the isolation and abandonment they are subject to. A participant shared that:

> *"My friends no longer come to me. Even the very people I am proud to call relations have all abandoned me all because they think I smell"* (Participant 28).

A key informant in an interaction also reiterated that:

> *"The way and manner patients are abandoned and left to their fate by relatives is not the best of treatment. In times of the ailment, that is the time they need the emotional support of their relatives to overcome the thoughts of the burden they carry about the ailment"* (Participant 24).

One participant who experienced incontinences of urine and fecal leakages said that:

> *"The level of my isolation has become too painful that, my husband, whom I expected to be my backbone in all situations, has abandoned me. To add more to my emotional woes, he told me in the face that, he cannot stay with an Obstetric urinating patient. This is the most painful comment ever heard since my disorder started. I understand it's a medical problem. And it's repairable. So why did he abandon me? It is shocking, to say the least"* (Participant 18).

The above responses from the women and key informants suggest that women living with obstetric fistula are subject to emotional abuses, rejection, marginalization, and stigmatization as well as ostracism from the larger society.

### Sexual Dysfunction, Disrupted Marital Relations, and Divorce

Participants interviewed complained of their inability to have normal sex. Others also complained of the difficulty to have sex after developing the obstetric fistula disorder. During our interaction with participants, it appeared that most participants attributed their divorce or marriage breakdown to their development of an obstetric fistula. Among those who were still married, some complained of limited or no sex life with their husbands whereas others complained of not receiving emotional support from their husbands. In our interaction, a participant said that:

> *"My marriage has known no peace and enjoyment since I developed this disorder. My husband has abandoned me. He is now married to another lady"* (Participant 12).

Another participant said that:

> *"I can see my husband has lost interest in me. He has left the home for a long time. He rarely visits. On days he decides to visit, he does not even eat the food I cook for him"* (Participant 20).

These concerns raised by participants resonated with what key informants shared with the research team. In our engagement, a family member who is a key informant stated that:

> *"Husbands start to maltreat and abandon their wives from the very moment they develop the disorder. This is very bad. This attitude of men destabilizes the family structure"* (Participant 29).

Another interviewed woman declared that:

> *"Yes, my family has been the source of support and my backbone since my ailment started. My mother and siblings have provided me the support that has got me to this level. I would say they are my reason for being alive today. My husband has not been of any help at all. He is better dead"* (Participant 2).

### Economic Consequences

Due to the stigma attached to the obstetric, many women tend to lose their jobs and are unable to engage in economic activities. As such, in times like this, with the onset of financial difficulties and uncertainties, some women have to endure a lot of hardship.

### Job Losses

In responding to issues of job losses, a participant commented that:

> *"I have lost my job because of this ailment. And no employer would want to engage me because of my ailment. The smell has deprived me of my source of livelihood"* (Participant 9).

A participant said that:

> *"Having this disorder is more than hell for an individual to contend with. I have been unwell for long with this ailment. The leakage has shattered my dreams and restricted me in many ways such that I can hardly go about with my normal daily life. I am a hard-working woman. But because of this ailment, I am home now. This is not typical of me"* (Participant 10).

Another participant stated that:

> *"Because of this sickness, I can't go to the market to sell. So, I don't have enough money to buy a pad. I have to buy a pad and use to absorb the leakage. This is a financial hurdle for me now. I feel uncomfortable when the pad is wet and don't have a replacement. So, in times like this, I use cut garments to absorb them. I remove them when they are wet, wash, dry and reuse them later"* (Participant 8).

One participant said that:

> *"Because of my indisposition, I am unable to work, so I am at home now. It has, therefore, become very difficult for me to survive. And I am also not receiving any help from my any source"* (Participant 16).

According to a family member of the obstetric fistula patient, the combined effects of all these have compounded the problem. He stated that:

> "*She was in good health and she was the breadwinner for the family. But now she can't participate in any activity"* (Participant 7).

### Financial Challenges

In a separate interview, another participant shared that:

> *"My husband is not in love with me. He does not even want to set eyes on me. Our marriage is shaky. He was no longer fulfilling his financial commitment s as he used to. Out of financial stress and other difficulties, I packed and came to my family"* (Participant 15).

### Dependency

Most interviewed participants indicated they are struggling to make ends meet. Another who lamented having lost her sustainable source of livelihood and survival stated that:

> *Since I developed this condition "Obstetric" I was depending on one single source. That source is what I get from my family especially my parents. When I want to go and pay for something, I have to beg my parents and wait for some days"* (Participant 13).

Another woman reported that she lost her working capability due to the frequent pain and the leakage of the urine, which made it difficult for her. She recounted that:

> *"I feel worthless because I have no capacity to work. My survival now is under threat. I am just imagining how I am going to make it in the rest of the years ahead of me without depending on others"* (Participant 27).

### Coping Measures

In our interaction with participants, it was revealed that almost all of them have devised measures to control the discomfort engendered by the onset of the obstetric fistula. Among some of the measures meant to normalize their situation range from distancing themselves from the larger society, maintaining a good sense of personal hygiene, use of good smelling perfume, use of sanitary pads, and other absorbent materials. A participant recounted that:

> *"In my difficulty, whiles I try to hide my situation from people, I try to control the smell from the leakage by using sanitary pads. When I don't have the money to buy the pads, I use other absorbents like pieces of garments to control it"* (Participant 30).

Another woman indicated that:

> *"I distance myself from the larger society. I refuse attending social gatherings to save myself from shame and finger-pointing. Most of the time, I hide at home"* (Participant 4).

Another participant narrated that:

> *"Almost every hour, I take shower and change my dress. When it is time for me to attend to something outside, I dress and apply perfume on my dress and go out. Mostly I have perfume on me. So anytime I feel like the smell is coming, I apply it to control the situation"* (Participant 20).

From the foregoing interactions, it is obvious how obstetric fistula patients devise ways and means of overcoming or controlling their situation.

## Discussion

The results of this research were elicited from diverse participants with obstetric fistula in five selected health facilities in Ghana. From the responses elicited, the wide array of experiences encountered by the participants were similar to the reports by previous researches (Khisa and Nyamongo 2012; Gebresilase 2014; Wilson et al. 2015) that obstetric fistula exerts heavy consequences including sores, skin rashes, and wounds around the genitalia, bad smell, leakages, and incontinences of urine and feces. Other social experiences brought about by the onset of obstetric fistula comprise marginalization, stigmatization, ostracism, abandonment and isolation, sexual dysfunction, disrupted marital relations, and divorce. This according to McKinney (2006) could necessitate clinical depression and suicidal thoughts. It may also bring about other forms of socioeconomic difficulties such as financial insecurity and dependency, as well as financial hardships occasioned by limited social support, financial constraints, and profound poverty and one's loss of health. The findings of this study are consistent with prior studies conducted in Ethiopia (WHO 2014; Muleta 2006; Browning et al. 2010; Burundi (Bishinga et al. 2013); Democratic Republic of Congo and Bangladesh (USAID 2012); Kenya (Khisa and Nyamongo 2012), Ghana (Mwini-Nyaledzigbor et al. 2013) as well as Nigeria (Okoye et al. 2014), and Tanzania (Wilson et al. 2015). These studies corroborate with the physical, psychosocial, and socioeconomic challenges found by this study as some of the experiences of obstetric fistula patients.

As revealed by this study, obstetric fistula patients exercise fears to enjoy sexual life with

their partners. This finding is in conformity with a study conducted in Kenya (Khisa et al. 2011) which reported that obstetric fistula victims still have fear to have sex with their husbands. This same study confirms that patients easily get divorced. This finding is consistent with this study finding which revealed that most participants sampled for this study were divorced. Most of the divorces could be ascribed to the urine and feces leakage that created smell and odor which their partners could not stand. Also, the inability of affected women to sexually satisfy their husbands stood as one of the factors that precipitated their divorce. This research finding agrees with a study carried out by Landry et al. (2013); Ampofo et al. (1990) as well as Pope et al. (2011) and Gebresilase (2014). These studies further confirmed that husbands married for the second time. This was also confirmed by participants and other interviewed key informants in this study. As confirmed by Lita (2008) and Drew et al. (2016), this research revealed that obstetric fistula victims do not get much support from their husbands as some of the husbands neglect their wives because of the fistula condition. The main challenge of obstetric fistula patients is smell and odor and its discomfort for patients has been confirmed in a number of studies conducted in other African countries (Mselle et al. 2011; Khisa and Nyamongo 2012; USAID 2012; Mwini-Nyaledzigbor et al. 2013). These studies assert that women who lived with obstetric fistula frequently get unsettled and emotionally worried about their situation.

As captured under the social experiences, specifically of marginalization, stigmatization, and abandonment, sexual dysfunction, disrupted marital relations, and divorce among obstetric fistula patients, earlier studies conducted in Kenya and Nigeria (Khisa and Nyamongo 2012; Okoye et al. 2014) reported that husbands develop attitudes that end up ostracizing their wives after developing an obstetric fistula. It was further revealed that women living with obstetric fistula face daily life challenges including the inability to engage in socioeconomic activities (Wall 2006). This, in their views, has deprived them of self-confidence while at the same time it has rendered them unable to maintain a sustainable source of income. This research study also confirms this finding. In our interaction with participants, most of them expressed their worries relative to their unwillingness and inability to attend social gatherings because of the development of obstetric fistula, which has brought about smell and odor.

In the course of the research, it was revealed that participants have control measures for managing the situation. While some of the participants indicated resorting to social isolation as a control measure, others also indicated that they use sanitary pads and other absorbents to control the situation while maintaining personal hygiene. As revealed by previous studies (Gebresilase 2014; Mwini-Nyaledzigbor et al. 2013; Okoye et al. 2014) and (Elzubeir et al. 2010), people with medical illnesses resort to using different measures to manage their situations. Similarly, as reported in previous studies (Mselle et al. 2011; Gebresilase 2014; Mwini-Nyaledzigbor et al. 2013), participants in this study also used garments as sanitary absorbents to control the leakage and odor. Others also cited frequent changing of clothing and use of perfumes.

## Conclusion, Recommendations, and Implications for Future Policy and Practice

Women with the condition have grave challenges contending with it and its ensuing debilitating discomfort comprising physical challenges such as wounds around the genitalia, bad smell, and leakage of urine and feces, psychosocial consequences such as marginalization, stigmatization, and ostracism, isolation and abandonment, reduced or truncated general social and marital relationships as well as economic consequences such as financial challenges, job losses, and dependency. The results accentuate how the combined effects of obstetric affect women

psychosocially, which is devastating even to an extent that the fulfillment of certain responsibilities by them becomes restricted. To assuage obstetric patients of the multipronged ordeals that the onset of the condition exposes them to, the study, therefore, recommends that continuous awareness and extensive public media campaign toward obstetric should be implemented at community levels to "generate media attention." Also, the Government of Ghana should devise means of social reintegration and women empowerment mechanisms for women with obstetric fistula.

Authorities of the selected health facilities, in concert with the Ministry of health, government and nongovernmental organization, civil society organizations, and stakeholders alike, should intermittently organize outreach programs targeting patients who visit their hospital and those within their catchment area to improve their knowledge on obstetric especially on the causes in order to equip them to detect and report suspected cases for treatment. The Ministry of Health, through community engagement strategies, should engage local community institutions to assist grassroots workers in tracking cases and organizing intermittent free mass screening exercises across the country. An extensive health education on obstetric should be undertaken by the hospital authorities in collaboration with social workers and community health workers.

In ensuring that the results and output of this study translate into concrete effects as in impacting on health policy directives of Ghana, we recommend a nationwide broad-based replication of this study to help address the complications, complexities, and etiology of obstetric to help foster a deeper understanding of the causal factors. A study of this nature would help gather expertise knowledge while helping build a national consensus among health practitioners on the way forward in mounting a national strategy to fight against obstetric while creating national awareness among people. Obstetric awareness education should be all integrative. Strategies designed by stakeholders relative to public enlightenment should be broadened to concentrate and target all members of the society. To ensure this, the Ministry of Health, Ghana Health Service, and other stakeholders like the department of social welfare, the World Health Organization, and UNICEF could join forces to execute this proposed policy strategy.

Advocacy, support, and reintegration efforts should be instituted to reduce the emotional and economic impacts of fistula. The findings of the study suggest that positive illustrations of support from family, friends, and communities can be enhanced by use in public education and advocacy efforts to break the stigma around fistula. Promoting sexual and reproductive rights should be promoted by the local government. Public education and interventions to mitigate the risks of fistula must address the full reproductive life cycle of girls and women. For this reason, community education efforts must inform people that all women are potentially at risk of obstetric fistula. In creating public awareness about the disorder, this study recommends that stakeholders team up with other institutions like the religious and educational institutions to help in reaching out to populations as part of efforts to sensitizing them and creating awareness among them about the disorder and ways and means to deal with it.

## Synonyms

Policy acceptance; Policy compliance

## Introduction

Group theorists and pluralists view public policy as a product of group interaction or struggle (Dahl 1978; Truman 1971). A large number of groups that are more, or less, well organized according to social, economic, and demographic similarities or needs compete with each other in the political arena. These groups put pressures on the government to gain access to the key points at which policy decisions are made (Theodoulou 2013; Truman 1971). Considering that public policy is the result of a process of power struggles among competing individual and group claims, it is critical for policy-makers to first identify the relevant stakeholders who may be affected by or who may influence the policy process. Particularly, when facing complex combinations of interest groups, any conflict concerning stakeholders' different needs is expected to be assessed and addressed. Moreover, in cases where a policy decision should be jointly made among stakeholders who pursue conflicting needs, policy-makers are required to minimize the adverse impacts of a policy and increase the likelihood that disaffected groups will still accept the policy.

However, conflicts can occur among various stakeholders, including conflicts between the government and affected groups, conflicts among different policy target groups, conflicts between the government and civic groups, and conflicts between central and local governments. Therefore, it is inevitably challenging for policy-makers and public managers to make high quality decisions while remaining responsive to the different groups those decisions affect. Meeting such challenges may pose serious problems, particularly when policy issues are technically complex and value-laden, when the policy decision is perceived as risky, and/or when multiple interests operate in an atmosphere of conflict and mistrust (Beierle 1999). For instance, the construction of facilities such as nuclear power plants, radioactive waste management facilities, incinerators, prisons, or landfills are prone to raising heavy concerns about localized risks (Jenkins-Smith et al. 2011). The public's resistance to hazardous or unwanted facilities leads to the *not in my backyard* (NIMBY) or so-called *locally unwanted land uses* (LULU) phenomenon (Schiverly 2007). Opposition to potentially hazardous facilities may be attributed to concerns about environmental threats, perceptions about facility safety, economic concerns about reduced property values, or localized losses that may outweigh prospects for some larger public good, dynamics in the public discourse of risk, or even mistrust in other participants and the information they provide (Jenkins-Smith et al. 2011; McAoy 1998; Schiverly 2007). Despite such strong opposition, many developed and developing countries are also faced with the dilemma posed by siting such hazardous facilities, particularly nuclear energy facilities, as a major energy source to protect national energy security needs (Jenkins-Smith et al. 2011; Kim et al. 2014). In this vein, understanding the public perception of the localized risks is substantial. Focusing on the case of the historical development of Korean nuclear energy policies, this entry addresses issues related to public acceptance of nuclear energy policies.

## Public Acceptance of Nuclear Energy

Public acceptance of nuclear policy refers to "people's willingness or readiness to receive, within

their governmental boundaries, the operation of nuclear power reactors for electricity generation and various applications of nuclear technologies, as determined by perception sharing" (Kim et al. 2014, p. 476). As reflected in this definition, public acceptance is inherently related to the attitudes of policy target groups, and for this reason, it may be used in a sense similar to policy compliance, which refers to policy target groups' willingness to obey a government's request, policy direction, and/or the regulation of action in the guidance and the implementation process. While policy compliance ensures that expressed behavior conforms to a set of prearranged rules of conduct, public acceptance highlights not only changes in outward behavior but also changes in internal value systems and attitudes (Jung 2008). Therefore, public acceptance can be understood as a complex social process in which the government understands the value system of target groups and encourages a positive attitude so policy groups will accept it. In other words, public acceptance involves an active process to achieve policy goals by reducing the gap between stakeholders' preferences and the government's policy direction. In this sense, public acceptance of nuclear policy can be understood as an overall process to understand the value system of the government-drafted nuclear energy policy and to induce positive attitudes to reach a consensus when conflicting needs and value systems exist among various stakeholders.

Researchers have investigated the factors affecting public acceptance of nuclear power. These factors include personal beliefs and attitudes (e.g., Midden and Verplanken 1990), general worldviews (Peter and Slovic 1996), a policy discourse that framed nuclear power in terms of climate change mitigation (Bickerstaff et al. 2008), perceived risks of nuclear power (Greenberg 2009; Whitfield et al. 2009), perceived benefits (Tanaka 2004), citizens' trust of nuclear institutions or their government (Ansolabehere and Konisky 2009; Greenberg 2009; Tanaka 2004; Whitfield et al. 2009), perceived costs of nuclear power (Ansolabehere and Konisky 2009), and so on.

Liu et al. (2008, p. 2834) further specify sources of subjective judgments that result in the acceptance of nuclear power with four categories and nine relevant issues as follows:

- Opinions on benefits of nuclear power: (1) benefit to the national power supply; (2) benefit to lower electricity prices; (3) benefit to environmental protection.
- Judgment of the risks: (4) judgment on operational risks of nuclear power plants; (5) judgment on the risks of nuclear waste (nuclear proliferation is not yet included here).
- Knowledge of nuclear power: (6) how much nuclear knowledge the public has; (7) self-assessed familiarity with nuclear power.
- Trust in the parties concerned: (8) trust in government agencies; and (9) trust in nuclear experts.

On the other hand, in their model of public acceptance of nuclear power, Visschers et al. (2011, p. 3623) highlight risk perception and benefit perception as key factors predicting public acceptance. In particular, benefit perception consists of two types of benefits, including perceived benefit for the climate (it is $CO_2$ neutral and therefore an effective mitigation strategy against climate change) as well as the perceived benefit of a secure energy supply (it will secure the fulfillment of our energy demands).

Based on previous studies on public acceptance of or resistance to nuclear power, this study specifies four dimensions of public acceptance of nuclear energy policies particularly in the context of South Korea. The four dimensions are technology acceptance, risk acceptance, economic acceptance, and political acceptance.

First, nuclear energy policy involves technology acceptance because it deals with highly advanced technologies. Whether it is a nuclear power plant or a radioactive waste management facility, public acceptance is determined by whether the technology can minimize the negative impact by significantly reducing the potential risk probability. This is equivalent to the acceptance of almost all groups of stakeholders because any group would prefer to minimize the risk probability through proven technology.

The second dimension of public acceptance of nuclear policy is risk acceptance which should be considered beyond the acceptance of the technology itself. Judgment of a technology is not made solely by the calculation of objective risk probabilities; instead it is socially constructed by considering the reputation of institutions and persons dealing with formal/informal information and related technology. In other words, risk acceptance involves an understanding of the political, social, economic, and cultural impacts of technologies. In particular, risk acceptance can be differently assessed depending on the group to which one belongs. Local residents living near nuclear facilities will demonstrate high levels of public concerns due to the risk, while groups who use power cheaply produced by nuclear power will emphasize the economic benefits and hold a stance that some risks should be accommodated.

Third, economic acceptance may be different between groups that benefit directly from the location of nuclear facilities and those that do not. Groups with huge economic rewards can take some risks, but those exposed to risks without economic rewards may resist because they have no incentive to take risks. These economic rewards include both direct compensation and indirect economic effects. The impact on the local economy in the construction and operation of nuclear facilities as well as the direct economic compensation received by local governments due to the location of nuclear facilities can act as important factors in determining public acceptance of nuclear power.

Finally, public acceptance of nuclear power can be shaped by political trust and ideology, which is referred to the political dimension of public acceptance. Citizens' political trust, a global affective orientation toward the governing body and politicians, has long been thought to reflect policy satisfaction and acceptance (Rudolph and Evans 2005). Citizens are more likely to support an expansion of nuclear power when the decision-makers (e.g., a president, ministers, and politicians) are perceived as trustworthy. Likewise, citizens' willingness to accept the nuclear policy highly depends on their political support, and therefore, it is even complicated for the government to consider conflicting needs and political preferences of various stakeholders in the process of decision-making.

## Case: Historical Review on the Development of Nuclear Power in South Korea

South Korea first became interested in nuclear power and technology in the 1950s due to a lack of energy sources needed to generate electricity. In 1959, the Korea Atomic Energy Research Institute (KAERI) was established to conduct basic research on nuclear power, technology and the safety of nuclear power plants, and economics of nuclear power. On March 1962, TRIGGA Mark-II, Korea's first research reactor, was provided by US firm General Atomics and General Dynamics under an agreement signed on 3 December 1958 to acquire practical nuclear technology. Based on the acquisition of such technological capabilities, the GORI-1 reactor, Korea's first commercial nuclear power plant, started commercial operation in April 1978 after 7 years of construction.

In the 1980s, additional PWR (Pressurized Water Reactor) and CANDU (Canadian Deuterium Uranium Reactor) nuclear power plants were built, and as part of effort to localize nuclear fuel cycle technology, the Korea Nuclear Fuel Company (KNFC) was established in 1982 and has been successfully producing nuclear fuel since 1989. During this period, domestic participation increased to enhance self-sufficiency in nuclear power plant construction and technology.

In the 1990s, through a technology transfer contract with the USA to increase self-reliance in nuclear power technology, Korean entities took responsibility for the entire projects, while foreign suppliers were mainly consultants. As a result, OPR-1000 (Optimized Power Reactor-1000), a Korean Standard Nuclear Power Plant (KNSP), was constructed. In the 2000s, Korea has made an all-out effort to supplement the core technologies, and in 2012, Korea fully attained self-reliance in nuclear power technology for long-term

self-reliance in fuel and plant design, manufacturing, construction, and operation. South Korea's first Advanced Pressurized Reactor with a 1400 MW(e) generating capacity (APR-1400) project began in 1992 with the basic design completed in 1999. The APR-1400 was developed by making improvements and modifications to the KNSP, and its commercial operation commenced in 2016. Korea's APR-1400 was exported to the UAE. Currently, a total of 24 nuclear power plants produce about 30% of the nation's electricity (Kim 2018). Table 1 provides the summary of key characteristics of each period of the development of nuclear power in South Korea.

South Korea became active in building and operating nuclear power plants because it lacked the energy sources to sustain its economic growth. The reserves of coal, the source of energy for thermal power generation, were far from sufficient, and oil and natural gas were not available, so thermal power alone could not produce enough cheap electricity for economic growth. Moreover, a stable supply of electricity was needed for sustainable economic growth, but the high dependence on energy sources overseas was bound to cause a sharp rise in the unit cost of electricity production due to price changes and would eventually hinder the competitiveness of industries in Korea. In this context, nuclear power generation began to receive a spotlight not only in terms of stability and efficiency, but the trend has been invigorated through the United Nations Framework Convention on Climate Change in 1992, which is a framework for international cooperation to combat climate change and prevent global warming due to the indiscriminate use of fossil fuels. Nuclear power generation was considered an alternative to greenhouse gas reduction

Source: Lee (2012)

in terms of generating little carbon dioxide compared to thermal power generation. In spite of the TMI nuclear accident in the USA in 1979 and the Chernobyl nuclear accident in the former Soviet Union in 1986, nuclear power has continued to grow in almost all countries. Since 2008, the Korean government has established a National Energy Master Plan every 5 years to cover the next 20 years, and in January 2014, the Korean government announced the Second National Energy Master Plan up to 2035. This plan outlined the future energy policy direction, including the development and deployment of nonfossil energy such as nuclear and renewable energy. South Korea seeks to achieve a 41% share of nuclear energy in regard to the total energy consumption by 2030.

There is no doubt that the potential of nuclear energy is tremendous, but there are also downsides. As the proportion of nuclear power plants has increased in South Korea, the problem of radiological waste management has begun to emerge, the nondemocratic behavior of the government in the site selection process of radioactive waste management facilities has begun to antagonize local residents, and because of the participation of antinuclear environmental groups, anxiety about nuclear power generation and distrust in the government has begun to worsen. The fact that it took more than two decades to decide the low and intermediate level radioactive waste disposal sites may be evidence of how many conflicts there have been due to such distrust. Although a gap apparently exists between the nature of accidents that could occur at nuclear power plants and those that could occur in radioactive waste management, people are becoming nervous about unclear power in general in the wake of the problems at the Fukushima nuclear power plant in Japan, questioning whether nuclear power is a sensible option for energy production in light of the perceived risks and provoking antinuclear groups to lead an antinuclear movement. Moreover, as the Moon Jae-in government promised to reduce the country's dependence on nuclear energy and has implemented a nuclear phase-out policy, the future of South Korea's nuclear power programs has seemingly come to the end.

## A Historical Analysis of Public Acceptance of Korea's Nuclear Policy

### Public Acceptance of Nuclear Policy in South Korea: 1940s–mid 1980s

In 1948, the Republic of Korea (South Korea) was formally established as a free democracy, with Rhee Syngman as the first president. It has been paying attention to nuclear power since the establishment of the Rhee administration. At the time, there were few industrial facilities and power production bases for national development, and even existing facilities were destroyed during the 1950–1953 Korean War, making power production an urgent task. For this reason, the Rhee administration (1948–1960) established the Korea Atomic Energy Research Institute (KAERI) to promote nuclear technology research, and South Korea became a member of the International Atomic Energy Agency in 1957. The Atomic Energy Law was passed in 1958, and in 1959, the Atomic Energy Institute was launched as a government agency dedicated to nuclear energy policies, and a nuclear power plant design and manufacturing company was established and fostered as an affiliated organization (Jung 2018).

Although President Rhee Syngman stepped down in 1960 due to the April 19 revolution, the project to introduce nuclear reactors continued, and nuclear power plant design and nuclear fuel manufacturing technologies were also steadily studied. At that time, there was no controversy over nuclear acceptance because of a low level of public awareness about nuclear power, and it was extremely rare for the government to inform or seek consent from the public about the public policies it was pushing.

The Third and Fourth Republic was a period of promoting the economic development of the state by President Park Chung-hee, whose top priority was the growth of a self-reliant economy and modernization. Under the slogan of "Development First, Unification Later," the economy grew rapidly with vast improvement in the industrial structure, especially in the basic and heavy chemical industries, and the supply of electricity for economic development became the biggest concern of the administration. The

Park administration (1963–1979) prepared legal and institutional devices necessary for the construction of nuclear power plants, pushed ahead with the selection of nuclear reactors to be introduced in Korea based on economic and technological feasibility, and concentrated on training nuclear power plant operation personnel. At that time, most people agreed with the national task of economic development, and there were no groups unhappy with or actively opposed to the government's nuclear energy policy, so it was more like policy compliance than discussing public acceptance (Jung 2018).

The situation was similar under the Chun Doo-hwan administration (1980–1988). As there was little controversy over citizens' acceptance of nuclear power, the government implemented an aggressive nuclear energy promotion policy by setting a localized target of 95% for nuclear technology and was continuing to build nuclear power plants. A total of seven nuclear power plants had been constructed and commercialized by 1987 when President Chun Doo-hwan was in power, and there were also nuclear power plants under construction. However, the majority of the public did not take issue with the potential risks of nuclear power plants but rather generally accepted them in terms of providing a driving force for the nation's development.

Overall, public acceptance of nuclear power in this period relied on high levels of technology acceptance in that the acquisition of technological capabilities of developed countries and the introduction and transfer of new technology from these countries were believed to advance domestic technological development. Moreover, considering that South Korea had experienced a government-driven rapid economic growth in this period of time, the Korean public expressed a high level of trust in the positive economic benefits of nuclear power as well as trust in government agencies. On the other hand, high levels of technology acceptance and higher trust in nuclear experts and institutions led to a lower risk perception of technological risk probability. Therefore, the high levels of technical, economic, and political dimensions of public acceptance as well as low levels of risk perception reinforced the laypeople's acceptance of nuclear power.

## Public Acceptance of Nuclear Policy in South Korea: Mid 1980s–2000s

The Sixth Republic was established in 1987 and remains the current republic of South Korea after the June 29 Declaration, which was called for holding direct presidential elections and the restoration of civil rights. Roh Tae-woo became president in the first direct presidential election and was officially inaugurated in February 1988. As democratization has progressed rapidly, South Korea has been experiencing a flurry of complaints about a military regime and past vestiges of authoritarian rule. This has made it difficult for the government to demand policy compliance with its closed actions any longer. For decades under the military regime, the Korean government had not paid attention to understanding the value system of local residents and how to make efforts to change their behavior, and in turn Koreans have shown high levels of distrust in government.

The issues regarding public acceptance of nuclear policy in South Korea have emerged not because of the risk of nuclear power plants but because of conflicts around radioactive waste generated as a by-product of power generation and siting conflicts during the selection and evaluation of a site suitable for a nuclear management facility. The Korean government has been discussing plans for radioactive waste management since 1983 and contracted outside consultation agencies to draw up candidate sites from 1986 to 1987 while the overall process was not publicly announced. However, the residents living in the candidate sites revealed that the process was not transparent, which led to serious distrust about the government's nuclear policy.

Even after the government publicly announced the selection process of candidate sites, public acceptance of nuclear power remained at a very low level due to a severe backlash from residents. In addition to distrust in the government, the democratization process amplified the public belief that local residents do not need to accept the government's policies if they do not conform to their own value system. Moreover, antinuclear

activities dramatically increased in conjunction with the rapid growth of civil society as well as concerns about nuclear safety and criticism of the nuclear policy making process. In this context, a set of factors caused the Korean government to experience massive policy failures in securing radioactive waste sites, which in turn heightened distrust in government and public acceptance of nuclear energy policies remains extremely low.

Moreover, the accidents at Three Mile Island in 1979 and Chernobyl in 1986 provoked negative public attitudes toward nuclear power, and anti-nuclear groups highlighted the potential damage from the released radioactive materials and the possibility of radioactive contamination. Through the social amplification processes (Pidgeon et al. 2003), nuclear accidents stigmatized nuclear power (Flynn 2003). Although nuclear accidents are rare, their severe damage generates a strong signal that perpetuates a negative image or stigmatization of nuclear power, and such risk perception has structured the fear of nuclear power and influenced public acceptance of nuclear power being remained extremely low.

Ironically, however, nuclear power plants have been continuously constructed and operated even after democratization despite more than seven major opposition campaigns in the selection process of radioactive waste repositories. The conservative administrations of Roh Tae-woo (1988–1993) and Kim Young-sam (1993–1998) focused on developing and implementing mid- and long-term plans for the nation's nuclear research and development. The progressive administrations of Kim Dae-jung (1998–2003) and Roh Moo-hyun (2003–2008) also established a comprehensive long-term plan for nuclear power development and expansion and planned to continuously construct eight additional Korean Standard Nuclear Power Plants by 2015 (Jung 2018). The development of nuclear power in Korea indicated that political, economic, and technology acceptance remained still high because there have not been any significant accidents at South Korea's nuclear power plants and the proportion of electricity production from the nuclear power cannot be ignored. However, the combination of local residents and antinuclear groups armed with specific ideologies and values created a severe backlash, which led to an increase in the awareness of the risks, eventually affecting public acceptance of nuclear power as a whole.

Since 1986, the Korean government has looked for a nuclear storage site for low- and intermediate-level radioactive waste (LILW), but for approximately 20 years, Korea was unable to find a location for the radioactive waste management project. However, long-term discourse between government and stakeholder groups led to public acceptance and trust, and accordingly, the policy was changed to promote the democratic process, improve procedural transparency, consider public acceptance, and increase credibility regarding safety (Yun 2008).

In 2005, for instance, various efforts were made to secure an LILW disposal site, and as a result, the Special Law on the Support for the Volunteer Site of the Low and Intermediate Level Waste Disposal Facilities was legislated on March 31, 2005. This law ensures the safety of the facility, promotes a democratic siting process, and provides financial support for economic development and quality of life in the area. Four local governments (Gyeongju, Gunsan, Youngdok, and Pohang) applied as volunteer sites, and these candidate sites were evaluated and confirmed to meet the safety recommendation standard. As a result of resident voting, Gyeongju was selected with the highest approval rate (89.5%) and received a special state subsidy of 300 billion won (about $288 million). During the siting process in 2005, antinuclear groups' activities rapidly declined and overall public acceptance of nuclear energy policies considerably increased. In 2005, for instance, local residents in the four regions blocked the intervention of antinuclear groups, tried to assess their economic feasibility, and attracted medium- and low-level radioactive waste dumps. The government, which had identified major causes of extreme opposition, created a referendum that allowed local residents to participate in the site selection process directly, provided economic incentives, and tried to increase acceptance of the project by preparing various systems and procedures. Thus, the government's efforts for understanding the value

and needs of stakeholders (e.g., local residents, general public, local government, local business leaders), developing strategies (e.g., economic incentives), ensuring procedural transparency, and eliminating negative perceptions of nuclear power were key to overcoming resistance to nuclear power and increasing public acceptance of nuclear energy policies.

In this period of democratization, public acceptance of nuclear power waxed and wanted. Despite initial enthusiasm in the 1960s and 1970s, the Korean public expressed significant levels of opposition to nuclear power due to distrust in the government decision-making process, antinuclear activities, and the nuclear accidents at TMI and Chernobyl. The low levels of technological and political acceptance and high level of risk concerns led to extremely low levels of public acceptance of nuclear energy policies. However, opposition to nuclear power appears to have decreased steadily in South Korea since the mid-2000s when newly enacted Special Law ensured the technological safety of the nuclear facility, promoted transparent democratic siting process, and provided a financial support to the volunteer sites for their economic development and quality of life in the area. Thus, enhanced technological, political, and economic acceptance helped people have favorable than unfavorable attitudes toward unclear energy.

### Public Acceptance of Nuclear Policy After the 2011 Fukushima Accident (Early 2010s)

During the Lee Myung-bak administration (2008–2013), the government adopted an ambitious Green Growth Strategy in 2009 and tried to revive nuclear power plants under the "Low Carbon, Green Growth" vision (Jung 2018). However, the March 2011 Fukushima nuclear accident in neighboring Japan had a huge impact on Korea's nuclear policy acceptance. On March 11, 2011, the cooling systems of the Fukushima Daiichi nuclear power plant were devastated due to a 9.0 magnitude earthquake and tsunami. Compared to nuclear accidents and incidents such as Chernobyl and TMI, the nuclear accident in a neighboring country amplified anxiety about nuclear power generation and caused people to be suspicious of the safety of nuclear energy (Wang and Kim 2013). In this situation, antinuclear groups, which had slowed in mid 2000s, became actively involved as the issue of managing spent nuclear fuel (SNF) emerged as a key issue in the nuclear policy.

South Korea has secured low- and intermediate-level radioactive waste management facilities but has yet to come up with a high-level radioactive waste management policy, including spent nuclear fuel (SNF). High-level radioactive waste (HLW) is more toxic than LILW and has a longer half-life (radioactive half-life time to return to natural radioactivity state). As a result, the government delayed the selection of the management site and faced strong resistance from local residents. In particular, while the government decided to draw up management policies based on public consensus, it was not easy to reach an agreement among various stakeholders, including residents near nuclear power plants, experts, and antinuclear groups. Local residents near nuclear power plants insisted on considerable economic incentives if the high-level hazardous waste was not removed. Antinuclear groups argued that the issue of managing high-level waste would be discussed only after a decision is made to shut down the plant. In addition, expert groups argued that the plant must be shut down if spent nuclear fuel in temporary storage inside a nuclear power plant is not brought out of the plant. In this context, the Policy Forum on SNF management was organized by government. Based on a review of SNF management options and public opinions, public engagement started with the launch of the Public Engagement Commission on SNF management in 2013. The commission decided major principles and methods of the public engagement programs, initiated public consultations and discussions, submitted recommendations to the government, and drew up the consent-based national plan on SNF management. However, the policy decision was not smooth due to resistance from residents near nuclear power plants, antinuclear groups, and a delayed public debate process. The government had to push for a re-publicization effort from 2019.

Only a few studies have been conducted to investigate how a nuclear power plant accident influences public acceptance of nuclear power in a longitudinal setting. Two European studies found that people had more negative attitudes toward nuclear power and a lower level of acceptance after the Chernobyl catastrophe (Eiser et al. 1989; Verplanken 1989). Specifically using the case of Fukuyama accident, Visschers and Siegrist (2013) were able to follow 790 Swiss people before and after Fukuyama (5 months before and directly after the accident) to measure public acceptance, perceived risks, perceived benefits, and trust related to nuclear power stations. From a longitudinal study, they found that in general, people presented a more negative perception of nuclear power after the accident. However, their findings show that even after the nuclear accident, the public did not dramatically change their attitudes toward nuclear power. Moreover, the public still considered the perceived benefits as relevant.

In the case of Korean public acceptance after the Fukuyama accident, it is consistently found that the public's risk perception has been dramatically increased and people have become seriously concerned about technological issues at nuclear faculties. While people recognized the economic benefits as important, political debates among various stakeholders and interest groups resulted in complex public discourses about sustainable nuclear policies and eventually led to reducing public acceptance of nuclear power in this period.

### Public Acceptance of Nuclear Policy in the Era of Changing Energy System (Mid 2010s–)

Nuclear policies in South Korea emerged as a national concern after the 2011 Fukushima nuclear accident and through public debate on the use of nuclear fuel. Unlike in the past when the majority of the public remained indifferent to nuclear policies, the Fukushima nuclear accident transformed the public's indifference into an active negative perception of nuclear power. Of course, the majority of the general public still does not pay much attention to South Korea's nuclear energy policy. While recognizing the risks, they perceive that there is no alternative power source to replace nuclear power and nuclear policies do not have a significant impact on their individual lives. Thus, in general, residents living near nuclear power plants have shown high levels of economic and technology acceptance but low levels of risk acceptance, while antinuclear groups have demonstrated low levels in all four dimensions of public acceptance. The general public did not receive any substantial economic benefits or compensation while recognizing the positive economic impacts of nuclear power. Instead they have been indifferent to nuclear energy policy or quite accepting of nuclear power since their economic/political acceptance is moderate. However, since the inauguration of President Moon Jae-in, nuclear policy has become a hot topic of debate among the public, because he pledged to phase out coal and nuclear energy considering the public's growing concerns about air pollution and nuclear safety.

The Moon administration (2017–2022) is emphasizing the transition to safe and clean renewable energy by abolishing existing nuclear-centered energy policies. President Moon's pursuit of a nuclear-free era made the fate of the two ongoing new nuclear reactor construction projects controversial, sparking heated debates between pro- and antinuclear groups in South Korea. Amid the public's growing concerns about nuclear safety, the Moon administration has emphasized the damage from the Fukushima nuclear accident, which was nearly 220 trillion won, and stressed the safety of nuclear power plants due to earthquakes in the densely populated areas of Korea. According to the Moon administration, the economic feasibility of nuclear power plants was assessed relatively high by underestimating the cost of dismantling nuclear power plants and waste management, and the social conflict in securing the site for radioactive waste management facilities was a huge waste of money. Moreover, advanced countries such as Germany and Switzerland are actively trying to convert energy, and the portion of nuclear power generation is decreasing worldwide (for more information: https://www.etrans.go.kr).

At the closing ceremony for the GORI-I reactor in June 2017, President Moon proclaimed that he

would review the policy on nuclear power plants entirely. He said, plans for new power reactors would be cancelled and the operating periods of existing units would not be extended beyond their designed lifetime. He added that he would reach a social consensus to suspend construction of units 5 and 6 of the Shin GORI plant. The president's remarks at the time were enough to draw attention from many people who were not previously interested in nuclear power plants. The people's attention to nuclear energy policy has been higher than ever because the former president was impeached due to the state-run meddling scandal and overwhelming public support under these circumstances. However, social conflicts arose due to a lack of consistency in the government's nuclear energy policy. Residents in the region were less receptive to a new nuclear energy policy when the government announced the suspension of construction of Shin-Kori 5 and 6 reactors. Local residents actively protested the nuclear phase-out policy, recognizing that the huge economic benefits from the construction and operation processes could be eliminated. In the end, a public discussion was conducted on whether to resume the construction of Shin-Kori Units 5 and 6, and the general public decided to resume the construction in consideration of the burial costs.

In 2019, the government has reinvigorated public debate on its spent nuclear fuel management policy. The government has made significant progress in terms of democratic decision-making process compared to the past; however, it is still unknown whether public engagement can increase public acceptance of nuclear policy when it comes to the different values and needs of stakeholders.

## Conclusion

This entry examines the public acceptance of South Korea's nuclear policy using a multidimensional approach. Levels of public acceptance are determined by the various groups interacting with the environmental conditions and the environmental context at the time. Under the Korean government's strong commitment to the nuclear power program for economic development, the question of public acceptance did not emerge, as the majority of the population was advocating for nuclear power. However, as democratization and a degree of economic development have progressed, a lack of efforts to improve transparency and develop consensus through risk communication might reinforce negative perceptions about nuclear power and decrease the level of public acceptance of nuclear power.

International issues as well as domestic ones have a significant impact on public acceptance. The massive nuclear disaster in Japan could lower public acceptance of nuclear policies by raising risk perceptions among uninterested ordinary citizens. Also, the president's political judgment can affect public acceptance as it creates a new context for debates. It should be noted that the government's efforts to maintain consistency in the policy, provide open accurate information to the public, improve transparency and accountability, increase trustworthiness, and adapt effectively to the changing environment will be beneficial for increasing public acceptance of nuclear policies.

[4]Faculty of Economics, Energy and Management Science, Makerere University Business School, Kampala, Uganda

## Synonyms

Answerability; Culpability; Liability; Responsibility

## Definitions

Accountability involves being held answerable for one's actions or decisions that attract consequences of punishment for performance or nonperformance.

P

| | |
|---|---|
| Public accountability | is the obligation of government agencies through the civil servants to explain the utilization of delegated responsibilities they exercised in trust on behalf of citizens. |
| Local government | is a lower-level administrative unit of a country set up in cities, districts, towns, counties, and parishes with responsibility to provide delegated or devolved services to the public. These units are manned by appointed and elected public officers. |

## Historical Perspective of Accountability

Accountability is a concept that originated from the old French word, "aconter," meaning to count and enumerate which equates to the Latin word, "computare," which denotes to reckon up and render account arithmetically. This concept gradually progressed to encompass accounting and bookkeeping, including nonnumerical matters. It later graduated to reckoning for money given or received, progressing to providing detailed explanation of money held in trust. Accountability as a concept was initially used in respect of holding individuals to account for tax on private property; and over the years, it advanced to holding sovereigns accountable to citizens for entrusted public authority and resources. Eventually, public accountability by governments became embraced as a fundamental requirement for good governance that makes a difference in the lives of citizens (Bovens 2014).

Accountability is helpful in explaining the institutionalized action of giving accounts with focus on public sector managers mandated to utilize public funds and exercise authority. In this way, communal resources are saved from wastage by operating in accordance with civic law. The concept has variously been studied considering it as a relationship between what citizens expect and what government officials are obliged to do. Answerability is thus the principle that individuals, organizations, persons, and the community are responsible for their actions and may be required to explain to others how they were exercised. Each party in an accountability relationship plays a distinct role with varying characteristics. While the principal exhibits a constant characteristic, the other party displays varying ones depending on whether they are agents or stewards. Agent civil servants present conflict of interest in the relationship, while stewards share the principal's interest. In terms of public business, the citizens are principal, while public officers are agents or stewards. In a state-society relationship, the principal is expected to enjoy superior authority, with agent in a subordinate position.

## Text of Public Accountability in African Local Governments

Ogentho, Munene, Kamukama, and Ntayi (2020) conceptualized public accountability in local governments as including six dimensions: transparency, accessibility, credibility, obligation, judgment, and sanctioning. Transparency underpins the importance of provision of information to the citizens proactively, especially that which is published or available upon request by members of the public. This is the hallmark of freedom for obtaining information on primary service delivery managed at the local government levels. The relevance of the second dimension, accessibility, stems from the requirement that every citizen has a right to access information and records in the custody of government or a public body. The exception is in the case where the release of the information is likely to prejudice the security or sovereignty of the state or interference with the right to the privacy of any other person. Another dimension is credibility of the report. This is the requirement that information and records to which a person is entitled shall be accurate and up-to-date as is practicable. Credibility, in this context, refers to the fact that the reported information should, in real terms, reflect the services delivered to recipient communities in local governments.

The fourth dimension presents public officers as having the obligation to account to citizens. It underscores the commitment of the parties involved in accountability. It indicates whether public officers know and perform their role of prompt display of local government financial information to the public, the willingness to respond to the public to answer demands raised on accountability, and whether the existing laws are adequate in forcing public officers to account to the general public. Citizens' ability to pass judgment on public officers is another dimension. In essence, this is the court of public opinion. In contemporary terms, it is the aggregate of individual attitudes or beliefs held by a population (in cities, districts, towns, counties, or parishes) on accountability situations. The public is expected to possess the capacity to verify whether their resources are being well managed. Judgment spells out whether citizens can openly denounce public officers who do inappropriate jobs, report their dissatisfaction on the performance of the public officers, and whether there exists a formal channel for the public to report nonperforming public officers.

The last dimension, citizens sanctioning public officers, provides opportunity to appreciate them for good performance and put a tag for non-performance. The sanctions options available to citizens in local government setting include inflicting shame, ridiculing, sarcasm, criticism, and disapproval. In extreme cases, sanctions may include social discrimination and exclusion. These sanctions provide means of informal social controls with effect on individuals given that their social values are internalized, thus becoming an aspect of the individual's personality. As for elected public officers, citizens exercise sanction by recalling them or voting them out of public office.

The concept of accountability within African local governments takes its roots from the informal sanctions and societal values inculcated at individual level. These controls are implicitly exercised by society through customs and norms either internalized unconsciously or through indoctrination. Acceptable behavior in society is rewarded, while unacceptable behavior (i.e., deviance) is punished. The breakdown in societal setup made it possible for non-accountability to thrive in the current African local governments.

## Rationale of Public Accountability

The main objective of public accountability is to provide good governance that delivers services to citizens through promoting transparency that eliminates favoritism, discrimination, fraud, corruption, money laundering, and other social evils from society. To achieve this, governments should be held answerable by citizens. The citizens should be able to reward and/or punish their government in order to influence the provision of services that are in their best interests. Accountability can be objectively categorized into two: either rendered about the process (procedure) or outcome (result). Accountability for process seeks to establish whether public officers' acts are in compliance with rules and regulations spelling out the manner in which the officers ought to conduct themselves. Answerability that specifically targets process tends to become inflexible and attempts to indicate how things ought to be done. Obligation for performance (outcome/result), on the other hand, focusses on whether or not government is achieving the intended results regardless of procedures (process). Outcome accountability emerged as part of the new public management paradigm in response to concerns by citizens on government performance on provision of quality services to them. This outcome obligation is concerned with whether the decisions of governments are in the best interest of their citizens. It is an attempt to shift accountability from complying with rules and regulations to achieving intended results. Using this approach, public officials can deliver service demanded by citizens through innovative and flexible approaches.

An appropriate system of transparency embraces responsibility for performance as well as for due process. Focusing attention on outcome only may result in little attention on how things should be done and thus provide loopholes for

corruption, unfairness, and unethical tendencies in the process of achieving results. Accountability is a fundamental requirement of good governance. It puts pressure on local government technocrats to report, explain, and be answerable for the consequences of decisions they make on behalf of the community they represent. Through accountability, actions and decisions taken by public officials get subjected to oversight and verification whether government imperatives are tailored to meet stated objectives and respond to society's needs and benefit. In this way, accountability contributes to better governance and poverty reduction.

## Approaches to Accountability

This is largely through two basic approaches: supply or demand accountability. These approaches emerge regardless whether the obligation is political, administrative, or financial/fiscal. Supply side accountability refers to the obligation of governments, elected representatives, corporate, and other governing bodies to publicly explain how they exercise their mandate that impacts on citizens who are the owners of resources. This aspect is the institutionalized practice of providing accountability by civil servants entrusted with utilizing public funds, exercising public authority, and managing corporate bodies in accordance with the relevant public laws. It offers political representatives and citizens (voters) the inputs for assessing effectiveness and efficiency of the system of governance. In an environment with excessive oversight and regulatory requirements, under this approach, most civil servants choose to satisfy the test of transparency through being audit-proof for process. Risk-taking and result-seeking executives may apply innovative ways to circumvent the formal rules and ensure they are not held accountable,

Demand-side accountability depends on pressure mounted through society based on civic engagements in which ordinary citizens and/or civil society organizations demand for openness. This attracts sanctions that necessitate the proactive role of civil society actors which is a form of social accountability initiative. This presents an emerging broader new obligation agenda in response to the general failures of democratic accountability in conventional institutions. This approach aims to overcome entrenched processes of elite capture and elite bias to deliver accountable governance to the poor and marginalized groups in society. Citizens' demand and sanctions can contribute to improved governance through monitoring to ensure authority is exercised in a transparent, responsive, and fair way; improved service delivery through provision of feedback to service providers on areas requiring improvement and helping to discipline them; and deepening democracy by allowing citizens to exercise their right to ensure government acts in the best interests of people.

## Traces of the Lack of Accountability in Sub-Saharan Africa

The lack of public accountability has bedevilled African local governments as reflected in poor services delivered to citizens. This is an indication of weak public interest demonstrated by some civil servants and is a challenge. Citizens get frustrated and feel that they are not empowered adequately to enforce transparency and answerability in their governments. This makes them resort to denouncing public officers for failure to remain responsible for entrusted community funds. The outcome of public accountability is expected to be visible as it provides key factors that drive success in society's projects. For example, tax compliance levels are very high in the Nordic countries despite their having the highest income tax rates. This compliance is because the outcomes of accountability are publicly evident as taxpayers derive direct benefits in form of good education, health, infrastructure, social welfare schemes, and other systems that are run using the taxes. Similar evidence is seen in Rwanda which is ranked the best country at continental level in improving the quality of life due to the high level of transparency despite having just emerged out of the ruins of genocide barely few years back. In this regard too, Mauritius is a state regarded as a reflection of encouraging levels of

public accountability in good service delivery. For example, the Mauritius Revenue Authority (MRA) collected better revenues that led to improved service delivery to her citizens.

In contrast, Ugandan citizens have resorted to tax evasion partly because of the absence of accountability in terms of tangible benefits out of tax payment. They cite the lack of visible results from taxpayers' money; they assert that a lot of public resources remain unexplained which has led to reduced participation and enthusiasm of citizens. Without a robust, transparent, and accountable government, it is not possible to assess reliably whether the decisions made by government have been in the interest of the public (Kwemarira et al. 2019).

In Uganda, for the period 2015–2019, Shs. 14.35 billion ($3.9 million) were unaccounted for by public officers at district and urban local governments (Auditor General' annual reports 2015–2019). This money is sufficient to provide 2.9 million poor rural citizens with single dose of malarial drugs supplied by the National Medical Stores (NMS) which can prevent their possible death from malarial infection. Equally, the Inspector General of Government of Uganda reported that Shs. 10 billion ($ 2.7 million) were recovered from local government officers who had previously failed to account for the funds (Inspector General of Government of Uganda 2015–2018). This money which was taken back to the Consolidated Fund is equivalent to providing four million rural school-going girl children sanitary towels that can boost their menstrual hygiene. This would facilitate their retention in schools as they are bedevilled by high dropout rates due to menstrual hygiene-related challenges. Lack of openness denies citizens services intended to have been delivered by government. It demonstrates that lack of transparency corrodes public esteem and leads to loss of trust by citizens in public officers.

## Conclusion

Public accountability in African local governments should be made effective by sensitizing citizens to take up ownership of public resources, participate, be assertive, and take up their role in demanding the public officers mandated to serve them to improve on transparency levels. Resources which are not owned tend to be cared for less because there is lack of control that goes with ownership. Public accountability seals the loophole of unchecked corruption, unfairness, and unethical practices in government. Public authorities should emulate their counterparts in other parts of the continent and ensure outcomes of their responsibility are evident for citizens to appreciate and improve their support for public resource mobilization. It will also help to restore public confidence in government. African countries should scale up their judgment and sanctioning of civil servants on account of their performance. Without these efforts, improvement in service delivery for the benefit of society may be a far-fetched expectation. A good balance between supply and demand and process and output accountabilities is essential for better transparency in society.

## Introduction

While public accountability is considered to be "a crucial principle, expectation, and foundation of a democratic governance system," (Lindquist and Huse 2017) as well as the most critical mandate of audit and inspection systems, its meaning and boundary have not yet been clearly defined. There have been continuous debates on how to operationalize the concept (Lindquist and Huse 2017), but it is considered to be elusive and amorphous (Dowdle 2006; Mulgan 2000).

Nevertheless, it is hard to deny that public accountability is considered to be one of the most important public values that asks audit and inspection institutions like the Board of Audit and Inspection (BAI) of the Republic of Korea to ensure that public actions are conducted according to legitimate policies and laws; that they abide ethical precepts; and that they produce expected outcomes.

The BAI is the only Supreme Audit Institution in Korea that is assigned with the constitutional power to check and balance accountability, which is to scrutinize the allocation and use of public funds as well as to inspect the performance of public agencies and individual officials to see if they are consistent with statutory and regulatory requirements, both in terms of procedure as well as outcome.

Based on the power delegated by the people and the National Assembly, the BAI bears the constitutional duty and authority to investigate, decide, and report to the public on whether public officials have provided proper accounts from the perspective of public interest. At the same time, the Board also makes recommendations on how the public should respond to the public officials' accounts, including disciplinary actions and policy recommendations. In this sense, the BAI is an entity, endowed with supreme power and accountability by the public, to ensure the public accountability of different levels of governments, public agencies, and executive branches.

The accountability system of Korea has a long history of 1300 years. Since the earlier form of the BAI, *Sajeongbu*, started in the Shilla Dynasty, AD 659, to detect wrongdoings and violations of central and local officials, the national audit and inspection system has gone through tremendous changes both in terms of structure as well as practice. Nevertheless, it is noteworthy how its spirits and practices maintained its core mandates for accountability, while its political, managerial, and social functions have changed over the history.

## Understanding Public Accountability

### Definition of Accountability

The origin of the term, *accountability*, is known to come from accounting and bookkeeping. However, these days, the concept is regarded more frequently as a symbol of good governance (Bovens 2007) as well as a necessary condition for democracy (Lonsdale and Bemelmans-Videc 2017: 15) rather than a mere principle for financial management. Despite the lack of "a single, grand unified theory of public accountability (Dowdle 2006: 15)," it seems that there is at least an agreement that accountability is closely related to the exercise of power and the legitimacy of policies (Lonsdale and Bemelmans-Videc 2017: 3). Most commonly, accountability is defined as "the obligation to present an account of and answer for the execution of

responsibilities to those who entrusted those responsibilities (Gray and Jenkins 1993: 55)."

It is notable that the accountability concept is often considered as equivalent, or at least most closely related to the responsibility concept. For example, based on its etymology, Hart (2008) defined accountability as equivalent or conceptually very close to responsibility. In comparison, scholars, including Mosher (1968), emphasized the differences between the two concepts. They characterized accountability to be rather objective, while responsibility subjective. According to them, accountability is based on formal obligation, so accountable actors have a formal duty to give an account of their actions to their formal accountability forum, usually with higher authority. Therefore, accountability is a formal mandate that needs to be expressed to other parties.

## Public Accountability Systems

To define the basic elements of a public accountability regime, Mashaw asked questions of "to whom, about what, through what processes, by what standards and with what effect" (2006:18). These questions capture the four major parts that characterize accountability, namely, (1) relationship, (2) performance of tasks, (3) oversight/direction/request, and (4) provision of information or justification (Stapenhurst and O'Brien 2005).

### Accountable About What

To the question of about what one should be accountable, scholars like Normanton (1971) defined accountability rather broadly, to include liability in the financial aspect as well as the responsibility to explain and justify their performance, which is expected by law, contract, and organizational roles and status. Public accountability relates to the question of how clearly roles and responsibilities are speculated by law, mandates, and regulations. For example, ministers are responsible for various functions including (1) leadership within the ministry, (2) legislative work in parliament, (3) administrative management, and (4) representation of ministry interests in cabinet meetings. For other public officials at lower levels: (1) making policy recommendations to ministers, (2) implementing policies and managing performance, and (3) carrying out administrative roles are main role responsibilities.

In addition to these role responsibilities, which are specified in laws and regulations, public officials are also accountable in terms of the ethical expectations of the society. Following the Confucian tradition, public officials in Korea are expected not only to be clean from corrupt behavior and to produce successful outcomes, but also to be role models according to the ethical and moral expectations of the society.

Within the realm of public governance, accountability can be categorized in various types like political, managerial, legal, consumer, and professional ones (Lawton and Rose 1991). For example, political accountability is based on political relationships, which is formed by elections and political appointment. Their duties and authorities are generated and delegated by the public, directly through elections and indirectly through the legislative process (Christensen and Lægreid 2015). While political accountability between voters and representatives or government staff works in a horizontal relationship, other accountability relationships are vertical, based on a hierarchical relationship where the superior in a higher position appoints and delegates formal power to the subordinate and holds them accountable for their performance of delegated duties (Christensen and Lægreid 2015).

Administrative accountability is an example of a hierarchical relationship. Administrative accountability is usually continuous and is formed in a context where a superior has requested the subordinate to account for his/her performance of delegated duties. Political accountability aims for political leaders' systematic responsiveness to the public's demand and preference. Usually it involves various methods of communication such as dialogue, debate, hearing, and forum (Christensen and Lægreid 2015). Administrative accountability is often neutral and technical, and thus involves accounts by recording such as bookkeeping and evaluation of the efficiency or effectiveness of task performance (Christensen and Lægreid 2015).

### Accountable to Whom

Accountability is a relational concept. It is based on relationships, where actors feel a duty to explain and to provide justification of their conduct and the outcome of the conduct to others to whom they are accountable. (Bovens 2014; Lerner and Tetlock 1999; Romzek and Dubnick 1987). Often, accountability relationships contain multiple parties, including an actor (accountor) and accountees or a forum, both of which can be individuals or agencies (Bovens 2014).

Depending on the direction and extent of delegation, accountability relationships can take various forms, horizontal or vertical, as well as internal or external. Vertical accountability is a common form, often described as a classic top-down and principal-agent relationship. Usually, in this relationship, the principal delegates duties and power to the agent and thus agents are accountable to their direct superiors. Horizontal accountability occurs between individuals or agencies. With increasing collaboration within and across sectors, organizations, and networks, cases of horizontal accountability are more commonly observed (Conteh 2016; Lindquist and Huse 2017). Horizontal and vertical accountability can exist both internally and externally to ministries and government agencies. External accountability is formed when an actor(s) (an individual, individuals or agencies) becomes accountable to accountees (or an accountable forum) outside the government office, such as parliament or citizens. Internal accountability is formed inside the executive branch, both vertically (when accountable to the superior) and horizontally (between individual officials or ministries).

Depending on the direction of authority, accountability directions can be upward or downward. Applying a directional model of public accountability, Elcock (1991: 162) suggested "upward, outward and downward" accountability. According to him, public officials are accountable to superior authorities such as the president or parliament (upward) and accountable to expert colleagues within or across government offices (outward). At the same time, they are accountable to the citizens (downward).

### How to Hold an Actor Accountable: The Public Accountability Mechanism

The two most distinctive characteristics or conditions for public accountability to take place are answerability and enforcement. Answerability is the responsibility of the government or executive branch and government officials to provide explanations about their decisions, actions they took, and consequences of the decisions and to justify them to the forum (Bemelmans-Videc 2017). At the same time, there should be enforcement. For instance, the public or the overseeing institutions (forum) can sanction the actor and correct illegal behaviors.

To ensure that a public accountability system works according to its mandate of answerability and enforcement, external forces such as the Supreme Audit Institution (SAI), an institution with political and legislative legitimacy, can play useful roles (Lonsdale and Bemelmans-Videc 2017). Public audit institutions, like SAIs, are entities that are entrusted by the public or parliament for third-party verification of public sector accountability. Also, a performance management system holds the public sector accountable to the public and the top management. Quantitative and qualitative evaluation data using various indicators that monitor processes and measure performance – for example, in the form of league tables – can improve the transparency of the public accountability system. Often, political systems can work as a sanctioning mechanism. For example, elections are the loosest form for rendering political accountability. In addition, questions by lawmakers, debates to draw ministerial responses, and investigations by legislative and investigation committees come under this kind of mechanism. Finally, close investigations of public servants' activities using an ombudsman system, an external financial audit, and various methods of regulations are mid-range mechanisms for accountability rendering.

### Public Accountability Framework

In Table 1, Korea's public accountability system is described in terms of three parameters, namely, "accountable about what," "accountable to whom," and "how to hold an actor accountable." In terms of "about what." public accountability centers on statutory responsibility, compliance with laws, performance, and ethical duties. In

terms of "to whom," there are three key dimensions: accountability to a superior, accountability among ministries and colleagues, and accountability to the National Assembly and citizens. And "how to" explains the mechanism for answerability and enforcement, like legal and ethical standards, performance standards, etc.

## Historical Changes of the Public Accountability System in Korea

### The Accountability System During the Joseon Dynasty

#### Introduction

The outset of the Joseon dynasty (1392–1897) was characterized as a time when government functions were expanded and strengthened with a solid financial system. The governance system of the previous dynasty, the Goryeo dynasty (918–1392), especially in its waning period, was characterized by the monopoly of court power, concentrated in the *Dopyeong* Assembly, a council of the old government administration. Despite the apparent six-ministry system, a small number of high government officials monopolized political powers in deciding major policies, the budget and personnel management.

In contrast, the governance system of the Joseon dynasty was a highly centralized monarchy. The first king put strong efforts to recover the monarch's political power by making it clear that major policy decision-making would be made with the king's approval. At the same time, the dynasty had a system where public officials eagerly participated in the decision-making process. The king, as the highest authority of the

country, had the formal authority to choose and appoint chief executives and to make the final policy decisions in consultation with the State Council (*Uijeongbu*), which was the highest deliberative body. The State Council's political power varied over the history of the dynasty, between the time when the six ministries – the chief executive body of the Joseon dynasty – had direct control, and other times when they played an advisory role under stronger kings. The six ministries in Joseon were unique in a way and different from many other bureaucratic systems in other monarchies, as they were relatively independent in making policy decisions and had a direct communication channel with the king.

## The Public Accountability System

**Accountable About What** During the Joseon dynasty, a system of hierarchical and upward accountability was established by specifying the roles and responsibilities of government offices at various levels. The governance of Joseon was established with an intention to reduce political monopoly and to promote competition, especially between the highly centralized monarchy and a neo-Confucian bureaucracy. The State Council, the highest deliberative body with the most powerful decision-making authorities, was firmly established. The chief executive body was the six ministries, namely, the ministries of taxation (*Hojo*), personnel management (*Yijo*), justice and law enforcement (*Hyeongjo*), military affairs (*Byeongjo*), rites (*Yejo*), and public works (*Gongjo*). Also, there were other executive offices of the king, including the Royal Secretariat, the three offices, the Royal Investigation Bureau, and the Capital Bureau.

The fiscal system of Joseon was operated as an annual budget-based accounting and expenditure management system. The Ministry of Taxation (*Hojo*) was the highest office, which collected taxes and handled state revenues. Cash transfers and inventory management were conducted with documents under the auspices of the Ministry of Taxation. The financial audit was performed by *Saheonbu*. During the Joseon dynasty, 200 officials were appointed and dispatched to local areas with authority officially delegated by the king. These officials had commanding authorities and responsibilities on administrative, financial, legal, defense, and security matters.

It is notable that public officials in Joseon were also expected to account for ethical discipline, in addition to role responsibilities that were specified and assigned by public authorities. Based on Confucianism, which was the dominating governance ideology, moral values, social norms – in addition to hierarchical loyalty between the king and subordinates – neo-Confucian humaneness, and strong ethical principles were emphasized and were expected to be strictly observed by public officials at every level of central and local governments.

**Accountable to Whom** During this period, public servants were accountable to kings for delegated authorities and duties to administer and implement policy decisions (Fig. 1). Therefore, accountability mechanisms for answerability and reporting were constructed mostly around kings. The State Council discussed and reached a consensus on major policies and then reported it to the king. After the king's approval, they conveyed the decision back to relevant offices for implementation. Notably, during the Joseon dynasty, kings participated in daily debates among scholars in the public research institute, *Gyeongyeon*, which was organized by the Office of Special Advisors (*Hongmungwan*). As a national research institute, major responsibilities of the Office were to study the Confucian philosophy and make recommendations to kings about policy questions based on Confucian values.

The six ministries were accountable to the king for their designated policy areas. It is notable that the ministers of the six ministries could report directly to kings, skipping intermediary steps at the State Council. Accordingly, the upward accountability line in the central government was formed from the lowest office, to the six ministries, and finally to the king, while the line in the local government was from a senior clerk (*hyangri*), local magistrate, governor of a province, and then to the king. As a channel of communication and appeals to the king, memorials (*sangso*) were submitted by public servants through the Court of

**Public Accountability System in Korea and Role of Board of Audit and Inspection, Fig. 1** The public accountability system in the Joseon Dynasty

Transmission (*Seungjeongwon*) to the king. Any public servant was able to participate in *ganjeng*, which was a system to remonstrate with and to provide advice to the king and other high officials. While the system was used as an effective channel to ensure upward accountability, it was also used as a mechanism for outward accountability.

The most distinctive characteristic of the accountability mechanism in Joseon was the system for ensuring downward accountability, one not usually found in Western monarchies. During the eighteenth century, there were at least six different ways of downward accountability, namely, *eochal, chaekmun, gu-eon, sunmun, sang-eon*, and *gyeok-jaeng*, for the king to communicate with public servants and subjects. Among the six methods, the first three, *eochal* (direct communication with higher officials), *chaekmun* (request for policy solutions for current problems), and *gu-eon* (a communication channel in case of national disasters and emergencies), were used as communication channels with subordinate public officials. The last three methods, *sunmun, sang-eon, and gyeokjaeng*, were used to apprehend the opinions of ordinary people outside the palace. Also, rooted in Confucian values, an official system for the common people to file a petition, "a drum for the people (*Shinmun-go*)" was set up and used during this period. With the system, people could first file a complaint to their local government. If the petition was not addressed appropriately, then they could beat the drum in front of the king's palace and file a complaint directly to the king.

For local administration during the Joseon dynasty, high-level officials were sent to provinces as governors, which strengthened the government's control of local governments. The role of local officials remained as implementers of central government policy decisions. Governors were under the auspices of the king, but the six departments at the local government were not managerially linked to the six ministries in the central government.

**How to Hold an Actor Accountable** The Joseon dynasty established a system of checks and balances, which aimed to prevent a monopoly of political power by any one section of the government or the monarch. The most notable system for accountability in Joseon was the three offices or *samsa*, which functioned as major institutions that

provided checks and balances on the monarch and public officials at the central and local level.

The three offices were composed of the Office of the Inspector General (*Saheonbu*), Office of the Censor-General (*Saganwon*), and Office of Special Advisors (*Hongmungwan*). The Office of the Inspector General was an institution of independent officials, who monitored wrongdoings, corruption, and the inefficiency of government officials, at various levels in both the central and local governments. As a public body with supreme power over the audit and inspection of public matters, officials here were endowed with substantial authorities and privileges to intervene in policy decisions and political matters in the government and to make comments on activities of the king as well as public officials. Also, they were granted the authority to agree to the appointment of public officials and to recommend candidates for high public positions. To avoid corruption and bribery, visitations to the residences of these officials were closely watched and prohibited. The Office of the Censor-General (*Saganwon*) played an advisory role to the king. Officials here were supposed to control and reverse a king's wrongdoings or improper actions by imploring the king to withdraw such actions. They also issued opinions about the general state of affairs. The Office of Special Advisors (*Hongmungwan*) was a research institute, which oversaw the royal library. Officials participated in daily lessons (*gyeongyeon*) and gave the king advice on political issues.

In terms of financial accountability, the Office of the Inspector General and the Ministry of Taxation (*Hojo*) were the main bodies that ensured financial and accounting responsibilities. *Gamchal*, an official at the Office of the Inspector General, was responsible for the inspection of accounting books and inventory management. Local authorities that handled various merchandises and rice were required to keep records of inventory and accounting activities (*jung-gi* system). These records were reported regularly to the superior offices and ultimately to the Ministry of Taxation. The *jung-gi* system was used as a policy tool not only for accounting books but also for internal control and prevention of corruption in accounting.

To inspect the duties and activities of public servants at the local government level, a system of royal inspectors was in place. Royal inspectors were under the control of the Ministry of Personnel Management (*Yijo*). There were also secret royal inspectors, who traveled to local areas incognito and served common people by monitoring inappropriate dealings, wrongdoings, and corruptive behavior of local officials.

During the Joseon era, rules for bureaucracy and responsibilities of public officials were ascribed in the State Code, the *Gyeongguk Daejeon*, which was promulgated in 1485. The *Gyeongguk Daejeon* was the most comprehensive Grand Code for State Administration, comprising every law, act, custom, and ordinance that provided legal standards on every aspect of society during the Joseon dynasty for over 500 years.

In terms of the performance accountability of public officials, there was a system of performance evaluation (*jeoncheo*). Work performance of public officials was scored in four grades, among which *jeon* was the lowest and *cheo* was the highest grade. Sanctions from the results were serious. Officials who received the highest grade ten times out of ten evaluations were promoted. Those who received the lowest grade were fired immediately.

### Summary of the System

The most distinctive characteristic of governance during the Joseon dynasty was its system of checks and balances, which distributed political power between the monarch and bureaucrats. Such a system is different from most other monarchies, where supreme power or sovereignty was held by a single person considered to have a divine right. While the Joseon dynasty was a monarchy with a king who made the final decision, the political philosophy was based on Confucian values, which emphasized people-centered governance principles and had various mechanisms for public officials to actively participate in the decision-making by the monarch.

The followings are several notable characteristics of Joseon governance to uphold accountability. First, Joseon had a solid system of internal accountability with relatively well-defined roles and responsibilities of public officials. Officially, the king had the supreme power for policy

decision-making, but major policy decisions were first suggested in discussions at the State Council and then submitted to the king for his approval. Public servants were able to participate in policy decision-making processes for major policies through various channels, including *sangso,* which was a system allowing subordinates to provide comments and advice directly to the king. The system was so unique that it is rarely found even in modern governance systems.

Secondly, a mechanism to hold central government officials answerable was set up with various control tools, including the impeachment of corrupt officials by the *daegan* at the Office of the Inspector General. Governors at provinces were also under supervision and inspection of the royal inspection system, which extended upward accountability to local areas.

Finally, Joseon was an era when downward accountability was realized through various mechanisms to listen to the people and collect their opinions and petitions. Common people and lower level officials could file petitions or provide comments to the king directly and indirectly. It is clearly a notable system of downward accountability hardly found in the monarchies of other countries.

While the Joseon dynasty was clearly an authoritative monarchy, accountability in various types was formed during the time and continued its tradition and spirit until the next Korean government system. Due to Japanese occupation, these features of the government accountability system were disconnected until the establishment of the Government of the Republic of Korea in 1948.

## The Public Accountability System During the Developmental State Stage (From the First to the Fifth Republic)

### Introduction

With the end of the Japanese colonial period, the most urgent priority of the new state was to build a strong and independent nation (Lee et al. 2018: 148). Since the start of the Republic of Korea, the nation needed a transition from the desperate morale of resistance to and independence from Japanese colonial rule to a spirit supporting the construction of a new and strong democratic nation. It was also a period of social and political confusion from rapid changes in every aspect of society, which faced urgent and immense pressure for an economic and political recovery from the scars of colonial rule and the Korean War afterwards.

Until the mid-1950s, the main governance strategy of the new nation's top leaders was to stabilize the nation with strong national security. It was a time before a solid bureaucratic system had taken root, and policy tools for taxation and national finances had not developed to a sophisticated level. The period between the 1960s and the 1980s was a time for high-speed economic growth, the major strategy of President Park Chung-hee, who took over the nation with a coup d'état and needed to explain the legitimacy of his rule.

The amendment of the Constitution during the Fifth Republic was marked by the reduction of presidential power. In addition, other major emphases of the amendment during this time included the extension of the basic rights of the people, the state responsibility to promote citizen's welfare, and the enhancement of the independence of the judicial branch.

### The Public Accountability System

**Accountable About What** Slowly but surely, this was a period when public accountability, in terms of roles and responsibilities, of a democratic government was established. The First and Second Republic (1948–1961) was a time of critical transition with a mixed presidential system – a combination of a parliamentary cabinet system and the presidential system. In the beginning, the president was merely an official head of state, while actual political and administrative power was in the hands of the prime minister.

Before long, the president gained real political and administrative power over the government. After going through a period of military governments in 1961–1962, the Third Republic witnessed an extreme concentration of presidential power (Lee 1998: 33). The president had enormous political and administrative power, ranging from the power to issue an emergency order, to the power to veto legislation, and the authority to declare martial law.

Later periods (Fourth and Fifth Republic) were a time of continuous and frequent expansion of the government organization. The government was restructured multiple times, of which the purpose was said to be to strengthen the national economy with a focus on the heavy industry and to stabilize society by stressing the importance of national security. Organizational restructuring was implemented in a unitary way under the strong authoritarian system, while such frequent reorganization led to the weakening of role responsibilities and accountability awareness within the executive branch.

It was a time when the accountability of role responsibilities among ministers was checked rigorously. Ministers had to resign when their performances did not meet the standard. During the Fourth Republic, the offices of ministers were more stable than in earlier periods, while during the Fifth Republic, ministers were frequently replaced and their terms in office were shorter than before.

Administrative efforts for economic development brought a marked growth in the size of the government. Therefore, during the Fifth Republic, frequent administrative reforms continued aiming for a clean and small government. A drastic reduction of the government size and continuous cutbacks of unnecessary functions, along with a series of efforts to align authorities and responsibilities of public servants and carefully designed personnel assignments seemed to remove inefficiencies and inappropriate practices in public administration during this time.

At the same time, observation of rules on the duties of civil servants and maintenance of integrity and probity by civil servants were also emphasized and included as evaluation criteria in the performance evaluation. The Public Service Ethics Act was enacted, which included mandates for senior civil servants to register and disclose their assets and properties for official review.

**Accountable to Whom** The accountability line in this period can be described as a centralized and hierarchical system, where the president and the executive branch had the core power over decision-making processes and implementation of government affairs.

After a short period of a prime minister-dominant system in the First Republic, soon the controlling power was passed on to the Office of the President, who then obtained authority to appoint ministers and major public officials, both at the central and local levels. Continuously, during the Third Republic, the presidential system was led by the slogan, "stabilization through a powerful nation." The president could appoint the prime minister and form the cabinet without parliamentary approval, which strengthened the presidential power while substantially weakening the power of the National Assembly.

As mechanisms to support the internal accountability system during the Third and Fourth Republic, the Board of Audit and Inspection (BAI) and the National Information Agency were set up under the direct supervision of the Office of the President. Under the authoritarian system of the developmental state, the president maintained a very close relationship with the bureaucracy, based on both control and dependence, which seemed to assist policy objectives that needed to be achieved with speed and efficiency.

As for the relationship with the National Assembly, the executive branch enjoyed a tremendous amount of autonomy. The power to control granted to the legislative branch only functioned in the early days of the First Republic, and later, as the ruling party continued to dominate the majority of the legislature, the National Assembly played a supporting role for the government, rather than keep the government in check (Ahn 1978: 173). The balancing power of the National Assembly had diminished so substantially that its authority to conduct an audit and investigation of state affairs had been abolished. Even in the Fifth Republic, when multiple political parties existed, the National Assembly was not able to properly deliberate the budget and review the national account settlement (Fig. 2).

With the obvious priority of economic growth and industrialization over democratization, it was a time when firm citizenship could not develop. The civil society and the private sector could not take on the role of a forum, to which the government should be accountable. But eventually, by the Fifth Republic, the civil society and the power of labor had matured considerably; the

**Public Accountability System in Korea and Role of Board of Audit and Inspection, Fig. 2** The public accountability system of the Fourth Republic

authoritarian government was losing momentum; and the ruling government had to face stronger political demand for democracy from the society. Nevertheless, under the closed administrative system, downward accountability did not reach expected levels.

**How to Hold an Actor Accountable** Overall, during the developmental state, an independent system to ensure public accountability was developed but could not be firmly established. Control of public officials occurred only internally, and not so much by external and independent third-party institutions that check and ensure horizontal and downward accountability. The mechanism for accountability, especially internal and upward accountability, was mostly based on the centralized bureaucratic control system.

The Third Republic introduced a system to review the performance of ministries and agencies. The results were used as feedback for the next budget allocation and planning with the goal to cutback government expenditure and to promote efficient budget allocation. The program functioned as an internal mechanism for the performance accountability of individuals and organizations. Also, as a mechanism to control the bureaucracy for internal accountability, the president was given the authority to replace ministers anytime s/he found it necessary. Meanwhile, ministers were rarely called upon to the National Assembly for hearings, which would have kept the executive branch politically accountable to the legislative branch.

During the early days of this period, functions of the BAI were divided and existed in two institutions: the Board of Audit and the Commission of Inspection. The Board of Audit was set up as a central administrative agency that monitored the use of taxpayers' money and audited government accounts, both at the central and local governments, and at public agencies. The Commission of Inspection was established to inspect duties and to detect corruptive behavior of public officials. Together, both institutions took on the role of ensuring upward and hierarchical accountability within the public sector.

During this period, both institutions, the Board of Audit and the Commission of Inspection reported directly to the president. The results of the review and confirmation of national accounts were not submitted directly to the National Assembly. The Board of Audit and the Commission of Inspection were able to enforce sanctions on and punish individuals and agencies. The results were not open to the public.

Table 2 below summarizes the accountability mechanism of the BAI using the RASCI model. **RASCI Model or RASCI Matrix** (Cabanillas, Resinas and Ruiz-Cortés 2011) is one of the methods used to assign and display responsibilities of individuals or in the organization. **RASCI** is an acronym from the initial letters of the following words:

**R** – **Responsible** – Who is responsible for carrying out the entrusted task or responsibility?
**A** – **Accountable** (also Approver) – To whom is the responsible actor supposed to report the results of work? Or who is responsible for what has been done?
**S** – **Support** – Who provides support during the implementation of the activity, process, or service?
**C** – **Consulted** – Who can provide advice or consultation for the task?
**I** – **Informed** – Who should be informed about the progress and the decisions in the task?

As shown in Table 2, during the First Republic, the accountability function of the BAI was limited. The BAI was responsible for verification of final accounts, audit of accounts, inspection, and retrial, and it was accountable to the president for verification of final accounts, audit of accounts, and inspection. In comparison, to the National Assembly, the BAI only provided information on verification of final accounts and inspection. The ombudsman system, where citizens could file a petition for any improper or unfair activities by civil servants, did not exist.

In the Third Republic, the Board of Audit and the Commission of Inspection were consolidated and the Board of Audit and Inspection (BAI), as it is now, was born. In terms of function, the role of the BAI became a combination of that of each institution. The reporting line had changed, so results of account confirmation were now sent to both the Office of the President and the National Assembly.

Table 3 below shows how accountability mechanisms of the BAI expanded during the Fourth Republic compared to during the First Republic. The Board now has added responsibilities of performance audit in its earlier form and request for examination. The Board also is accountable to the National Assembly for the verification of final accounts. To note, the BAI during this time had responsibilities to provide information to the people as well as to the civil service by opening audit reports to the public.

### Summary of the System

The first priority of the political leadership in the developmental state was to obtain legitimacy

**Public Accountability System in Korea and Role of Board of Audit and Inspection, Table 2** The accountability mechanism of the Board of Audit and the Commission of Inspection in the First Republic

with economic development led by industrialization. The government under strong presidential power in a yet immature democracy seemed to possess almost limitless political power and authority. In such a state, the public accountability system was built based on bureaucratic and hierarchical accountability rather than on political and downward accountability. The executive branch was delegated to make most of the critical policy decisions and to implement them with strong presidential support. The most notable characteristics of the public accountability system of this time can be summarized as follows:

First, due to the weak separation of powers, which ended up concentrating power and authority in the presidential office, a mechanism for political accountability did not develop at a sophisticated level, especially in the beginning of the era. The president had limitless power over the legislative and the judicial branches, which indicated that there were no entities to demand political accountability from the president and his administrative branch. The role responsibilities of the prime minister were limited as most of the government decisions and implementation, including organizational operation, personnel management, and budgeting, were dominated by the bureaucracy under the strong presidential leadership. As a result, the mechanism for horizontal accountability between ministries did not function properly.

Secondly, the government's role responsibilities were focused mostly on promoting economic growth. Building an organizational structure and functions to promote economic development was the main priority, and the bureaucracy was restructured for this purpose. In such an environment, there was keen interest from ministries and ministers to focus mostly on strengthening the nation's economy.

Thirdly, the BAI, which existed as two separate institutions in the beginning, was consolidated into one during the Third Republic and incrementally strengthened its accountability mechanism. The reporting line changed. In the beginning, the BAI reported only to the president, and audit results were not open to the public. Later, the reporting system changed and results of account confirmation were sent to both the Office of the President and the National Assembly.

Finally, democratic accountability to citizens was not as active as upward and hierarchical accountability, as the following evidence shows: First, the BAI acted as an institution for internal inspection under the auspices of the president. Also, the absence of an independent ombudsman system, which helps the government listen and respond to citizen petitions, is another example. Economic development was prioritized over democracy, as economic prosperity was accepted as the fruit of authoritarian governance. Continuous demonstrations by college students and citizens, organized strikes and joint struggles by workers and farmers ignited the demand for stronger downward accountability and democratic accountability.

## The Public Accountability System During the Establishment of Democracy (The Sixth Republic)

### Introduction

The Sixth Republic, when democracy finally took root, is said to have started with the constitutional amendment in 1987, which adopted a direct presidential election system, while limiting the presidential term to 5 years without a re-election. During this time, a system of democratic government accountability was at last established in Korea.

Roh Tae-woo's presidency, which started as a minority government, had to face diverse political, economic, administrative, and social changes. The political power of the National Assembly was strengthened, as an authority for checks and balances on the executive branch. From the aspect of public administration, the president's shorter 5-year term in office led to more administrative plans focused on immediate political issues rather than on long-term visionary agenda.

The focus of the Kim Young-sam government was on building a civilian government, a small and strong one, with globalization and an open-door policy. Pressure to open the nation and welcome globalization, the dominance of New Public Management (NPM) values in administrative affairs, and heightened voices and stronger demand from the civil society all contributed to changes in the approach to public accountability. Most importantly, the focus of governance finally deviated from that of the developmental state, which emphasized extreme concentration of power in the executive branch for government planning and coordination.

The Kim Dae-jung government started with a heavy burden and responsibility to recover from the 1997 Asian financial crisis. In response to strong criticism for the economic crisis, the government reduced its size. Nevertheless, the actual roles and responsibilities of the executive branch did not diminish (Park 2016: 217).

President Roh Moo-hyun's government started at a time of deep public distrust in the government. The government faced severe global competition and prolonged stagflation in the domestic economy. With the slogan, "a transparent and effective government," the political leadership emphasized efficiency in government performance under the spirit of New Public Management. Notably, citizen capacity and awareness of civil rights were enhanced substantially. The leadership also focused on building a new governance system based on a collaborative relationship between the public and private sectors along with the civil society (Park 2016: 229).

### The Public Accountability System

**Accountable About What** The most notable characteristic of the 1987 constitutional amendment removed the president's power to dismiss the National Assembly and limited the presidential power to exercise authority regarding emergency orders, emergency financial and economic actions or orders, as well as the declaration and termination of martial law. At the same time, the National Assembly regained its authority to audit and investigate state affairs, to demand the dismissal of the prime minister and the cabinet, and to organize a hearing, which strengthened its political power against the executive branch. As a result, the balance between the executive and the legislative branches seemed to be restored.

During the Roh Tae-woo government, the autonomy of the executive branch weakened considerably compared to the previous era. In terms of economic policies, the political leadership also changed its approach from the previous style of government-led economic growth to one that emphasized the autonomy of the private sector (Kim 2014: 136–137). Notably, elections for local council members were reintroduced in 1991, which provided a foundation for local autonomy and accountability, as well as subsequent changes in the relationship between the central and local governments.

The most prominent feature of the Kim Young-sam government was public sector reforms, which finally shifted the focus away from the state affairs of the developmental state, which valued highly concentrated planning and coordination targeting faster and efficient economic development. The government was restructured several times to make it smaller,

but those reform efforts were not evaluated as successful (Ha 2011; Kim and Kwon 1997).

The major focus of the Kim Dae-jung government was to downsize the functions of the executive branch. The reduced power and authority of ministries responsible for economic development was also a visible change, a symbolic action that illustrated a crucial move away from the developmental state. Most notably, in operational management, innovative approaches like entrepreneurial management, an open position system, a responsible management system, the Citizen's Charter, and a customer-oriented administrative system were adopted and contributed to enhancing public accountability.

During President Roh Moo-hyun's term, there was a serious effort to make horizontal adjustments, realize decentralization, and coordinate roles and responsibilities within the public sector. Overall, the reform aimed to promote the autonomy of ministries, and thus strengthen upward accountability by the autonomous effort of each ministry rather than with top-down pressure from the top leadership. In terms of organizational structure, the autonomy of ministries expanded and several new administrative systems, such as a performance-based organization and a total payroll cost system, were introduced.

**Accountable to Whom** The most prominent characteristic of the accountability system in this period was the change in the accountability line, in terms of to whom the government and public officials were to be accountable. This period began when trust in the government had collapsed after a series of political corruption scandals and wrongdoings by public officials and political leaders. During the developmental state, when upward accountability toward the presidential leadership worked efficiently, ministerial coordination was not a serious problem. However, at the start of the democratic state, the presidential leadership was losing its authority compared to previous years. It seemed that the presidential system with a shorter term and no reelection exposed several problems like shortsighted policy cycles often resulting in policy failures. Consequently, frequent cabinet reshuffles with ministers often arraigned for policy failures and low performance evidently weakened ministerial accountability to the presidential leadership (Fig. 3).

Limitations of vertical accountability within the boundary of bureaucracy were noted, and downward and political accountability were strengthened instead. The two most critical factors that affected autonomy and accountability of the executive branch were the growth and maturation

GES: Government Ethics Committee
ACC: Anti-Corruption Commission

**Public Accountability System in Korea and Role of Board of Audit and Inspection, Fig. 3** The public accountability system of the Sixth Republic

of the civil society and the strengthening of parliamentary power. The political power and authority of the National Assembly was enhanced. The National Assembly Budget Office was established in 2003, which scaled up the budget deliberation role of the National Assembly. Besides, the demand for meaningful participation by the civil society and the private sector was heightened to unprecedented levels. Nevertheless, the mechanisms for downward accountability were not established in the beginning of the period.

It was at the end of the Roh Moo-hyun government, when the number of civic groups increased to reach 3000 and more citizens took on the role of armchair auditors, that such mechanisms were put in place. Notably, participatory budget decisions, citizens' watch over the inefficiencies and waste in budget implementation, and request for the public announcement of budget spending performance were examples of citizen participation in the budgeting process. There was also an increasing number of public hearings, associations, and committees, in which citizen representatives could participate. Other systematic mechanisms such as the Citizen's Charter and the Integrated Public Service Evaluation System were in place to ensure performance accountability of the public sector.

**How to Hold an Actor Accountable** Throughout this period, various programs and policies were adopted and refined to promote public accountability. Most of all, diverse systems to upgrade and reinforce downward and political accountability were established and further evolved to maximize their effect.

As a remedy for weakened hierarchical accountability, especially ministerial accountability within the executive branch, several programs like performance management systems and contracting-out with the private sector were adopted as a means to boost the effectiveness and efficiency of government performance.

During this time, the Board of Audit and Inspection experienced a drastic transformation, expanding its traditional role of inspecting works performed by government agencies and the duties of their employees, and detecting unlawful behaviors and wrongdoings of public officials. In 1993, the Board launched a performance audit program. Accordingly, the boundaries of audit criteria were expanded from those of regularity to those of effectiveness and efficiency in policy implementation. The focus of the disposition of audit results has also broadened from requests for disciplinary action to more frequent recommendations and requests for improvement. A variety of new programs were introduced, including an audit request system allowing an audit and inspection upon request from the National Assembly and citizens. The Request for Audit in Public Interest (1996), Citizens' Request for an Audit (2002), and the National Assembly Audit Request (2003) were examples of the participatory audit programs.

Table 4 illustrates the public accountability mechanisms of the BAI during the Sixth Republic. As shown, the Board has responsibilities

| Re-examination | R | | | |
| Claims | R | | | |
| Audit request | R | | A | A/I |

Note: *R* responsible, *A* accountable, *S* support, *C* consulted, *I* informed

to respond to the audit requests from the National Assembly and the people.

### Summary of the System

The political system during this period was marked by weakening state autonomy and the decentralization of authorities and responsibilities along with the growth of the civil society. The mature civil society, with an expanding middle class, urged the executive branch to reduce its size and roles, calling for greater accountability in terms of role responsibilities and performances. At the same time, the National Assembly regained its political power to oversee government affairs.

From the perspective of public accountability, this was a time when the bureaucracy underwent vast substantial changes. First of all, various mechanisms for the government to be accountable to the National Assembly were established as the political power of the presidency was reduced. The authority and responsibility of the National Assembly to audit and investigate state affairs, to request the dismissal of cabinet members and the prime minister, to request information and attendance to hearings, to hold confirmation hearings, and to request the BAI for an audit and inspection were recovered or introduced strengthening the horizontal and political accountability of the government to the National Assembly. Also, the proliferation of New Public Management values promoted market domination over the government. Accordingly, privatization of public enterprises and contracting-out of government activities were prevalent, making the public accountability system more complicated.

At the same time, labor and civil movements were vitalized with clearer and stronger demand for a democratic political system. However, stable mechanisms for downward accountability were not yet firmly established. As a result, social issues frequently burst out in the form of massive rallies and vigorous demonstrations. Nevertheless, with the expansion of the local autonomous government system, various systems to reflect citizens' voices, such as participatory budgeting, the ombudsman system, the Citizen Audit Request, the Audit Request for Public Interests, the Public Service Charter, and the Performance Management and Public Notice system, were established and developed as mechanisms for downward accountability.

The public accountability system during this era showed the following characteristics, which were distinctive from previous governments. First of all, the public accountability system became considerably complicated, due to reduced state autonomy and increased articulation of non-state actors. Previous systems of strict hierarchical accountability under a strong presidential leadership were not found to be very effective. As public officials received variant messages from short-lived political leadership, the public officials displayed self-protective behaviors and inactive responses to social demand, which in turn paralyzed agenda setting and policy decision-making power of bureaucrats in the government. Instead, horizontal accountability within the bureaucracy, between ministries, and between the executive branch and the National Assembly, was emphasized and activated. Downward accountability mechanisms between the government and the civil society were also enhanced. As a result, a bureaucratic culture asking for administrative accountability as well as performance accountability has overridden the previous one, which focused on the exercise of power and authority.

Secondly, along with diminished presidential power, there were amendments of the Constitution and laws to consolidate parliamentary power, which allowed the National Assembly to recover its role of checks and balances against the executive branch. With better human resources possessing expertise and experience, the offices of the National Assembly became better equipped to exercise their responsibility and authority to ensure government accountability.

Lastly, the rapid growth of the civil society opened opportunities for citizens to actively participate in administrative affairs, both at the central and local levels. Downward accountability became a serious agenda. However, mechanisms for downward accountability often did not yet function at the level expected by society. Dissatisfied citizens walked out onto the streets and participated in mass demonstrations and rallies to express their opinions and make requests to the government. How to build a system for

citizens to present their values and for public officials to respond to these voices so that the downward accountability to the civil society can take a firm place in our society will continue to be the most critical task for public leadership to be faithfully accountable to the people.

## Conclusion: Future Directions for Improvement

Trust in the government, which is the cornerstone of good governance, can be obtained with a system of strong accountability and transparency. A robust accountability system, which clearly describes who is accountable to whom about what, allows a transparent government system that shows how the government is doing and what they can do to gain redress when things go wrong. The system ensures that civil service is acting in the interests of the people they serve.

Despite its long tradition from 1300 years ago, starting as an established accountability system of the Joseon dynasty, which balanced the political power and administrative responsibilities between the monarch and the public servants, and slowly but continuously developing into the system of recent governments, the accountability system in Korea still has room for improvements.

Most of all, the level of public trust in government is still low, much below the OECD average. According to international surveys, perception of corruption in the public sector is improving but Korea still ranks 30th out of the 36 OECD countries (Transparency International 2019). The presidential system with a single 5-year term is said to be causing administrative "short-ism" and accountability gaps between ministers and public officials. A highly hierarchical accountability tradition may hold the government back from keeping pace with the increasingly complex modern society. Fragmented accountability tools, which successive administrations have introduced, are likely to aggravate the passive behavior of public officials. This promotes defensiveness, encourages compliance and precludes learning from mistakes. Considering that inflexible accountability systems can prevent innovative spirit (Christensen and Lægreid 2015), continuous improvement and learning should be an important objective, along with control and assurance (Aucoin and Heintzman 2000; Lindquist and Huse 2017).

Refining the accountability system across the breadth of the government requires a range of improvements. For example, ministerial accountability, including clarifying the responsibilities of ministries, needs to be redefined. Also, strengthening autonomous control in the public sector by establishing an internal control system and enhancing transparency around processes of policy making and implementation to facilitate network governance, would be necessary to address issues arising from the current accountability system.

Most of all, refining the role of the Board of Audit and Inspection as an independent Supreme Audit Institution is necessary. The Board must readily confront the accountability challenges and contribute to holding the government rightly accountable to the public. For this, the Board must take action to further strengthen its audit strategy, governance, human resources, and knowledge management strategies. The BAI should establish a strategy to support the creation of public value in the public sector. For better audit governance, the BAI should build stronger collaborative relations with the National Assembly, civil society and internal audit institutions. Also, the BAI should transform its audit approach from a substantive approach to a risk-based and in-depth evaluation in order to raise the value of public auditing.

Last but not least, despite the tradition of downward accountability, which existed from the Joseon dynasty, recent governments are perceived as not yet fully responding to the demand of civil society and the private sector, whose voices have gained strength during the era of democracy. Considering how the oversight authority ultimately comes from the citizenry, it is also important that citizens and civic groups to have dependable mechanisms that redress their grievances in the case of inappropriate or inadequate government action.

This is becoming a more complex problem as the accountability regime is transforming to a more complex and dynamic one based on hybrid relations in the reality of a pluralistic governance system.

Then, the key challenge is how to manage diverse and partly conflicting expectations (Romzek and Dubnick 1987) as well as multiple or contradictory standards (Steets 2010). Public organizations and officials will be accountable to diverse forums, and will face namely, "the problems of many eyes" (Bovens 2007; Romzek and Dubnick 1987). Then, as Christensen and Lægreid (2015) contended, it is important to move beyond the traditional perception of accountability from a hierarchical principal-agent approach and be ready to cope with "a liquid state with a fluid, complex, flexible, semi-autonomous and fragmented multi-level governance polity." (p. 223)

# Public Administration and Corruption

Anil Hira[1], Martin J. Murillo[2] and Anna Kim[1]
[1]Simon Fraser University, Burnaby, BC, Canada
[2]University of Notre Dame, South Bend, IN, USA

## Synonyms

Breach of trust; Bribery; Crime; Crookedness; Exploitation; Extortion; Fraud; Graft; Malfeasance; Misrepresentation; Nepotism; Profiteering; Racket; Rent-seeking; Skimming; Squeeze; Venality

## Definition

Corruption is most often defined as "the use of public office for the pursue of private gain" (Galtung et al. 2013). This reflects a contractual relationship between the state and its bureaucrats and more broadly between the state and its citizens (Ledeneva 2009; Hira 2016). However, corruption increasingly refers to any breach of trust, malfeasance of intended duty, or failure to deliver in both practice and spirit for any agreement when the purpose is the gain of just one of the parties. Thus, corruption can occur at all levels of governance and include public, private, or nonprofit actors. Corruption is sometimes divided between petty, everyday corruption, and corruption scandals that occur on a large scale. Corruption can involve a wide variety of activities, from bribery to nepotism to favoritism.

## Introduction

Corruption, or misuse of office and abrogation of duties for pecuniary gain, has been common to all human societies. The development of the idea of a common interest, and subsequently a neutral bureaucracy looking out for the best interests of society, in the West helped to solidify the idea that corruption is something that could be rooted out, or minimized, though it has proven to be an ongoing process. In the postcolonial era after World War II, attention naturally turned to reforming developing countries, where widespread abuse of public finances and offices has taken place. Besides the wastage and misallocation or resources, corruption corrodes public trust and the legitimacy of government while reducing long-term investment. Attempts to reproduce Western style bureaucracies and accountability mechanisms, and the spread of democracy as well as extensive monitoring efforts through global indices, have brought attention to the problem, but yielded limited results. Both the indices and much of the literature around corruption seem to point out the obvious that corruption in the West is lower than in the developing world (Treisman 2000). Consensus around a causal theory that would lead to a more comprehensive reform effort has been contentious around whether an economics or cultural approach makes more sense. There is the possibility to see overlap between the two approaches, leading to a more effective corruption reform strategy.

## Theories on Sources of Corruption (Kim and Hira)

There are two main approaches to understanding the sources of corruption, economic and anthropological. The economic approach emphasizes the possibilities that cost-benefit analysis of cheating, that is, the costs of enforcement vs. the private gains from stealing or engaging in favoritism (Lambsdorff 2002). The anthropological approach looks more at cultural norms as a source of behavior, that is, formal bureaucracy may not reflect long-standing loyalties, traditions, and relationships that lead to corruption.

The dominant approach from economics has a deep and rich literature behind it and has informed most of the effort behind corruption reform. The ubiquitous term "rent seeking" was popularized by economist Anne Krueger in 1974. Rent seeking refers to the pursuit of individual or group private interest at the expense of public interests. It is often used to reflect the pursuit of gains by

special interest groups and thus tied to campaign finance. Economists also tie corruption to transaction costs or the costs or creating a link between a buyer and a seller (Lambsdorff et al. 2005). Oldenburg thus defines corruption as "the exchange of money or favor for a benefit disbursed by government official" (Oldenburg 1987, p. 512). Government officials have an inherent conflict of interest in that they are to put national interests above their own individual or agency ones.

More complicating still is the fact that many transactions involve information uncertainty on the part of one or more parties to the transaction (Akerlof 1970). On top of this possibility for asymmetric information and the accompanying imbalance in power (e.g., the seller of a used car) is the principal-agent problem which comes up when one hires an expert in a field to act on their behalf and/or provide a service, such as a lawyer. The essential challenge is how to evaluate the role and performance of the agent when one lacks the expertise, no more so than in government decisions. In parallel, a middleman or broker in a transaction may benefit unduly from both of these phenomena. The Coase theorem (1960) suggests that property rights hold a key to reducing corruption since they internalize all transactions under one actor, such as a corporation that provides a beginning to end production process. However, many public activities, such as regulating environmental pollution or national security, are not possible to privatize.

Economics suggests that reciprocity is the basis of long-term cooperation (Axelrod 1984). Reciprocity leads them toward a generalized notion of social trust, giving an individual an incentive to play by the rules so that he/she does not suffer from violations. Thus, economists have a strong explanation why both good and bad practices of corruption tend to be self-reinforcing. Repeated transactions and the need for transparency thus form the foundation for institutions or organizations which bear and enforce rules of behavior for collective action.

It is hard to tell what role politics has on corruption. Though the general consensus is that vibrant democracies should be less corrupt (Treisman 2007), recent work on corrupt democracies such as India belies any simplistic notions (Riley and Roy 2016). There is contention about what types and activities of democracy reduce corruption. For example, Brunneti and Weder (2003) argue that the freedom of the press is particularly important to expose corrupt officials and as a result will lead to the lower corruption over time. Kunicov'a and Rose-Ackerman (2005) claim that presidential systems have higher perceived corruption compared to their parliamentary counterparts.

From the cultural perspective, corruption reflects deeply embedded values and relationships. For example, some authors claim that power distance is a cultural value, reflecting the degree of tolerance from public and number of checks and balances against the abuse of power. In more egalitarian societies such as those in Scandinavia, therefore there is less corruption than in more unequal societies such as India and China (Hofstede and Hofstede 2005). However, those who study culture approach corruption in a very different way. Corruption is often viewed as a Western lens which unfairly judges developing societies (Torsello 2014). Authors such as Blundo (2007) therefore suggest studying culture as a reflection of more informal and less acknowledged cultural practices. Corruption is therefore understood as emanating from a clash between formal (Western) institutions and traditional ones based on more informal and less recognized personal networks. Such networks include long-term personal relationships which allow individuals to deal as a group with formal institutions and avoid uncertainty in an environment of scarcity through information exchange, political support, and bureaucratic favors (Lomnitz and Sheinbaum 2004; Jancsics 2014). Such networks can be found all around the world: in America it is called *pull*, in Russia *blat*, in Latin America *compadrazgo*, in Israel *protexia*, in Mexico *palanca*, and in China *guanchi* (Lomintz 1988). Thus nepotism is not seen in the same negative light as it is in the West (Jaskiewicz et al. 2013). The networks may also be vertical in the sense of a patron bestowing favors upon a client in exchange for loyalty or long-term debts (Boissevain 1989;

Campbell 1989; Jackall 2010, pp. 18–44). Thus much of the formal movement toward democracy, even in the West, covers up patron-client activity that tends to elicit corruption.

The general approach coming from economics that has informed most corruption reform efforts is to increase penalties, transparency of transactions and regulations, and set up oversight agencies to examine transactions. The transactions approach is embraced by the leading global actors on corruption reform such as Transparency International and the World Bank. While there have been improvements in general awareness, there is no real sign of general shifts away from corruption globally. Therefore, new studies call for some combination of the two approaches, recognizing and seeking to change and merge informal and formal approaches to corruption reform (Hira 2016).

## History of Corruption and Attempts to Fight It in the West (Hira)

If the West is the model to follow, how did it establish "clean" government? We can begin our review of the history of corruption in the West in a counterintuitive way: since corruption has been around since the beginning of time, the more interesting question is what are the roots of anti-corruption efforts? Along the lines of cultural approaches to corruption, it is still important to point out that anti-corruption has its roots in Western ideas around morality. Corruption in its broadest sense is any violation of accepted morality. In the West, the sources of morality are most proximately Judeo-Christian traditions, particularly the notion of sin. The most primordial story of the Garden of Eden is based on the devil's lies. Corruption was historically tied to sin through a sense of uncleanliness, a violation of purity through dishonesty, which then made everything else metaphorically unclean and diseased (Bayless 2012). This helps to explain why we have an instinctively repugnant response to even petty corruption in the West, which is much harder to observe elsewhere. We essentially see corruption as an individual failing and breach of trust. The breach of trust is exacerbated when such violations take place in the public sector, which has additionally packed in notions of social, public, and collective responsibility. Arguably, then, in the West, proscriptions against corruption are much stronger due to the overlap of both individual and social implications in public activities, whereas in more corrupt societies there is a perceived long-standing breach between an individual bureaucrat's and public interests. Thus, ironically it is the focus on individual responsibility, regardless of context, in the West that allows for a strong sense of responsibility, whereas in societies which are more group oriented, it is more understandable for an individual to take care of their clan or extended family before taking care of their public responsibility.

We can see in the West, therefore, that the justice and legal systems are built around the broader notion of dealing with moral violations. "The rule of law," whereby the law is above individual interests and decisions, is a key concept that enshrines moral codes into a standing set of reified rules, a phenomenon rarely found in the developing world. The concept has deep roots in Greek and Roman history. In terms of corruption, these are embedded in the well-accepted principles of codes of conduct, conflicts of interest, independent judicial and regulatory review, and whistle-blowing, along with the overriding one of due process in investigating purported violations (Miller et al. 2005). Such notions were developed and supported during medieval times by the idea that even rulers were subject to God's law (Møller and Skaaning 2014, 131). Underlying these systems are the deeply embedded beliefs that the end does not justify the means, the need for stable rules of behavior, above all for honesty. This is not to say that other societies are a- or immoral, only that their notions of corruption in practice do not match those of the West. In times where behavior in the West deviates from such guidelines, a correction inevitably ensues. For example, the turn of the twentieth century in the USA is sometimes looked upon fondly in terms of the machine politics of the big cities like Chicago or New York, where votes and contracts were frequently bought off from recent and often illiterate

immigrants; however, the violence of the Prohibition (with parallels in narco-trafficking today) era demonstrated the problem that allowing the breaking of rules in one area of society would spill over into others and that social norms had to support the rules.

Corruption does occur in the contemporary West, as stories from cost overruns in Afghanistan by US defense contractors to the massive scandal around FIFA abound. Large parts of southern Italy are rife with extortion payoffs and control of certain subsectors of production by illegal groups. It is more the perception and pervasiveness of corruption that varies. In the West, most everyday transactions are generally stable and predictable whereas in the developing world, they are more prone to changing conditions. The best examples of that are the regular and peaceful succession of governmental change after a fair election and the independent role of law enforcement and the judiciary, both things often lacking in the developing world. It bears examining, therefore, how the West developed the notions of corruption that it is now attempting to universalize.

It would be difficult to retrace the exact steps of the evolutionary process in the West that led to less corrupt bureaucracies. Neild (2002, 12) links it to the rivalry among European states, whereby efficiency and stability in the public administration supported military success. The foundation of Western notions of propriety relate to the rule of law, property rights, and the development of the Weberian bureaucracy. All of these can be seen as parts of the overall context of accountability by election and by checks and balances among branches of government. Behind these is the concept of a public interest that supersedes that of any individual or group, with the government as the embodiment of it.

The idea of the rule of law is designed not only to set up orderly and acceptable conduct in public administration, but also to give a sense of confidence to the population at large in terms of equal and fair treatment under transparent rules of behavior. The rule of law is much more forceful than enacting law. As the cases of Latin America and Russia attest, enforcement and the spirit of the law are equally important to having a legal code.

Property rights figure large in most accounts of Western propriety. Property rights are in essence contractual boundaries for ownership of the benefits deriving from a piece of land, business, etc. that are ultimately enforced by the state. Property rights are thus essential to the free trade/exchange of assets in a reliable fashion. Tying into the monetary system, valuations of them, and the ability to exchange property, goods and services for financial reward is the heart of the capitalist system allowing for accumulation and long-term investment.

Behind these systems is the public bureaucracy. The modern Western bureaucracy is generally traced to developments in Western Europe around 1790–1850. Within the next 100 years, many of the attributes of a modern bureaucracy, including functional divisions and task allocation, non-political personnel no longer appointed by sale of offices, ranking systems, and professional pay and pension systems developed (Raadschelders and Rutgers 1996, 75–80).

Weber's (1978) notion of advanced bureaucracy is central to Western propriety. Weber posited that traditional cultural systems would give way over time to a modern state where a merit-based neutral bureaucracy with strict rules on conflicts of interest and separate, stable budgets would make decisions in the best interests of society. This approach still represents our ideal view of the principles behind bureaucracies, though practices vary considerably. Yet, in practice, most Western bureaucracies are mixed systems, whereby political appointments occur at the highest levels (e.g., ministers or ambassadors), and merit-based hiring should take place at the lower levels. In some cases, such as local prosecutors or judges, there is a direct election. Historically, there has been a continual tension between these two systems, the first derided as the "spoils system," a term popularized by appointments under US Pres. Andrew Jackson of his cronies to high positions. A related area of ongoing tension is public procurement. The Western principle is that public contracts should be awarded in a public competition with the criteria clearly known. The development of auditors, whistleblowers, and transparency for public contracts

reflects an ongoing concern. A more recent addition to accountability agents is the ombudsmen, an office that hears public complaints about corruption or poor service directly. In essence such efforts are bound to be limited because of: (a) the levels of expertise required to understand and weigh the different aspects of different proposals, (b) the number of contractors who can deliver on many contracts that is bound to be limited and subject to collusion, and (c) the possibility of hijacking or otherwise marginalizing the accountability efforts. A perfect example of the latter is the conflict of interest that occurred by rating agencies for junk US housing derivatives leading up to the 2008 financial crisis. The agencies had a basic conflict of interest because they wanted ongoing contracts from the issuers of the bonds (Hira 2015). What is underplayed in many discussions due to the prominence of the economics approach is the culture of bureaucracy in the West. Not only formal codes of conduct but a genuine spirit of public service abounds in Western bureaucracies.

The last piece for understanding Western approaches to corruption derives from the notion of checks and balances (Montesquieu 1748). This is often called "horizontal" accountability as opposed to the vertical accountability manifested through elections or appointments (where the supervisor has responsibility). The checks and balances approaches reflect the enshrinement of law enforcement and judicial independence. Along with that is the idea of overlapping roles, such as the need for the executive to propose budgets and the legislature to approve them. The overlap draws back to the basic history of democratic development in the West whereby European kings relied upon aristocratic landholding families in the Middle Ages to finance wars. This was the original source of power for a separate legislative branch as enshrined in the Magna Carta. Eventually, this evolved into the enshrined principle that the king should be accountable to oversight by the legislature and, over time, toward elected government. Elections are still considered the ultimate source of accountability. Perhaps an equally important role is played by the media, to uncover stories of corruption. The role of investigative journalism works hand in hand to allow whistleblowers access to a wider audience, as in the famous case of "Deep Throat" who revealed the Watergate scandal was tied to US Pres. Nixon in the 1970s.

We see, then, that democracy itself is pervaded by the idea of accountability. Where transparency breaks down, such as the lack of oversight on privacy of security gathering of personal information following the 9/11 terrorist attack in the USA, skepticism and distrust of government start to creep in, undermining its effectiveness. The importance of values is underscored by noting that even when rules are not violated, violations of the spirit of propriety are quite serious. A contemporary example is the row over campaign donations by ultra-wealthy individuals in the USA currently. While such notions are common throughout the West, the level of tolerance of violations varies greatly over time and space. In Canada, for example, Québec has a reputation for questionable public contracts. Propriety seems to break down often when Western companies work overseas as we discuss in the section on development and corruption. The boundaries of corruption are not as easy to discern in the West, then, as is commonly portrayed. The example of the Wikileaks scandal whereby a number of embarrassing classified communications were hacked and released publically demonstrates that there are still limits and controversy around transparency and accountability in the public sector.

Growing skepticism in the West about the role of government from the 1980s led to a series of reform movements which are discussed in detail in other sections of this volume. The first is called the New Public Management (NPM). NPM seeks to increase accountability by emphasizing a market approach to public services. Where private providers can provide the service, they are preferred. If not, the government should act like a private firm in terms of developing measures of performance, from setting up competition among providers to objective measures such as waiting times to allowing citizens ("clients") to evaluate the service. Government agencies may even

compete against each other. The second is the whole-of-government approach which sees government agencies as too fragmented and lacking in communication across functional areas, in distinction with the separation of powers tradition. It sets up integrated tasks forces and other means to improve integration and coordination. It is still too early to tell whether such reforms will make any dent on corruption, but there are reasons to be skeptical. While the NPM is helpful in creating a sense of performance, there are many functions outside of routine mundane functions, such as providing drivers' licenses, that are difficult to measure. Horizontal efforts go against a variety of systems including recruitment that are designed to build functional specialization along vertical lines.

The history of corruption in the West is ongoing rather than resolved. While the West has relatively strong accountability and normative systems that reduce levels of corruption, we should be very cautious about finding solutions or replicating systems that developed over hundreds of years in individual national circumstances. Ongoing scandals show that accountability systems must evolve over time as well.

## Global Measurements of Corruption (Murillo)

The measurement of corruption is a particular area of interest related to the need to map out corruption as part of general reform efforts. Quantitative approaches to tracking corruption allow cross-country comparison over time. These, in turn, have important and profound decisions on global economic transactions, particularly investment flows. However, the measurement of corruption has been an area of disagreement between stakeholders from different fields. The plethora of methodologies, measurement instruments, and indices represent in turn different conceptualizations of corruption. This section elaborates on three ways to measure corruption: surveys, expert assessments, and composite indices.

### Representative Surveys of Service Users

Measurement of corruption through nationally representative opinion surveys is a common method to assess corruption levels in a nation. The two general types are private sector (business) surveys and general population surveys. Nationally representative surveys of firms or households provide a good insight of apparent corrupt practices in the provision of government services to the citizen. The samples range from randomized general population samples to surveys of the private sector and segments of the public administration. The size and nature of the samples has varied considerably.

Private sector-led surveys measure only corrupt transactions happening between public officials and business firms. For instance, they enquire about bribes paid in tax collection or in business licensing and also identify the types of firms that pay more in bribes. Business people are frequently surveyed since they are thought to be knowledgeable in this field (Knack 2006).

Overall, these types of surveys provide a specific corruption measure that can be used to shed light on aspects of corruption that are not emphasized by the more broad perception-based indicators, which focus primarily on administrative corruption.

Among the many private sector surveys, two large surveys are the World Bank Enterprise Surveys and WEF's Executive Opinion Survey. Both are parts of broader surveys of an economy's private sector. World Bank Enterprise Surveys capture the prevalence of different types of bribery in 135 countries. The results are based on surveys of more than 130,000 firms. The Enterprise Survey is carried out through face-to-face interviews with firm managers and owners regarding the business environment in their countries and the productivity of their firms. Corruption is one of the topics covered through questions on bribes paid for different government services and processes. Others topics include infrastructure, trade, finance, regulations, taxes and business licensing, crime and informality, finance, innovation, labor, and perceptions about obstacles to doing business (WB 2015). The World Economic

Forum's (WEF) Executive Opinion Survey also has corruption as one of its topics. The survey is applied to a sample of firm managers in most nations of the world. Ratings are computed as the simple average of all executives' responses (Knack 2006).

### Citizen Surveys

There is a plethora of household surveys that address corruption issues. Some surveys are entirely focused to corruption, while others explore a wide gamma of variables, corruption being one of them. Each of them differs on the nations covered, the methodology utilized, and the sample characteristics.

Transparency International's Global Corruption Barometer (GCB) is an annual opinion survey of approximately 1000 people from each of 107 countries (for the sample taken from Sep. 2012 to Mar. 2013) that tracks public opinion on corruption. Administered to a representative sample of the population, it addresses people's direct experiences with bribery and details their views on corruption in the main institutions in their countries. The survey also provides insights into how willing and ready people are to act to stop corruption. The survey was applied to 500 urban residents in six countries with a population of less than 1000,000. The survey is administered face to face in local languages, through computer-assisted telephone interviewing or online, depending on the country context (Hardoon and Heinrich 2013).

The World Values Surveys (WVS) is carried out by professional survey organizations, using face-to-face interviews. All national samples were drawn from the residential population of 18 years and older and have a minimum sample size of 1000 individuals. In most countries, some form of stratified multistage random sampling was used to obtain representative national samples. In the first stage, a random selection of sampling points was made based on the given society's statistical regions, districts, census units, election sections, electoral registers or voting stations, and central population registers. In most countries, the population size and/or degree of urbanization of these primary sampling units (PSUs) were taken into account. In the second stage, the list of addresses within each PSU was chosen using standard random route procedures. In the third stage, various methods were used to select respondents within households. In most countries, substitution of respondents was allowed (Kravtsova et al. 2014).

Another survey is Gallup International Voice of the People. As in the WVS, corruption is one of many topics of the survey questions. The survey is conducted in 59 countries, with an approximate minimal sample size of 500 per country. Wherever possible, within each country, a nationally representative sample of 500 adults, male and female, aged 18 years and over, is used. In some emergent countries, where such research conditions are not possible, there may be stated variations to this (e.g., urban areas only). Similarly, in the developed world, interviews were conducted by telephone, while in emergent and underdeveloped countries, face-to-face interviews were conducted (Gallup 2012).

Similar types of surveys are International Crime Victim Surveys, New Democracy Barometer, Afrobarometer, Asia Barometer, Latinobarometer, and many others. These are characterized by focusing on different world geographies and economies and by having corruption only a part of the survey (Knack 2006).

### Expert Assessments

In contrast to citizen surveys, expert assessments are surveys given to a network of correspondents with country-specific expertise. Given the nature of the data sources, these assessments of corruption have been most widely used for comparisons across countries and over time.

These assessments differ in various aspects that can have important impacts on the survey results. For instance, they generally focus on specific geographical or economical regions, thus providing limited number of nations. They also differ in how the surveys are managed and processed. For instance, some surveys are very centralized approaches, with final ratings being determined by a very small number of people from views of a network of correspondents with country-specific expertise. Others follow a more

decentralized approach where final ratings are directly determined from experts with experience in different countries. A hybrid version utilizes regional hubs in order that process information.

These assessments also differ on how transparent is their methodology and whether they have clear definitions of the various concepts. While some indices provide detailed documentation and qualitative details, others provide little documentation, which raises important questions in regard to the nature of its data source and the rationale of the choice of the different parameters (Knack 2006).

An example of well-utilized expert assessment is the African Development Bank Governance Ratings 2014 (AFDB). Part of the Country Policy and Institutional Assessment (CPIA), the Governance Ratings assesses the quality of a country's institutional framework in terms of how conducive it is to fostering the effective use of development assistance. The index is characterized by maximum level of uniformity and consistency across all regional member countries surveyed. The CPIA is carried out by a group of country economists with vast experience in policy analysis. The knowledge of these experts is complemented with that of local contacts that provide both quantitative and qualitative insights. Peer discussions are also used to monitor the quality of the findings. Experts are asked to assess the transparency, accountability, and corruption in the public sector. Three dimensions are addressed: the accountability of the executive to oversight institutions and of public employees for their performance, access of civil society to information on public affairs, and state capture by narrow vested interests. The assessment covers 40 African countries (TI 2015).

The Economist Intelligence Unit (EIU) Country Risk Ratings is another example of expert surveys. Country Risk Ratings are designed to provide in-depth and timely analysis of the risks of financial exposure in more than 140 countries. The EIU relies on teams of experts based primarily in London (but also in New York, Hong Kong, Beijing, and Shanghai) who are supported by a global network of in-country specialists. Each country analyst covers a maximum of two or three countries/territories. The economic and political reports produced by EIU analysts are subjected to a rigorous review process before publication. Scores are given as integers on a scale from 0 (very low incidence of corruption) to 4 (very high incidence of corruption). One hundred twenty-eight countries/territories were scored in 2015. Data is available to subscribers of EIU Country Risk Service (TI 2015).

### Composite Indices

The assessment of corruption of citizen surveys, firm surveys, and expert assessments have various limitations. First, each is purposely defined too narrowly in order to capture different aspects of corruption. For instance, some might reflect only corrupt interactions between firms and public officials. Second, each is focused to various aspects of governance or other phenomena, corruption being only one of the components, frequently represented by a small number of questions. Third, each individual survey might introduce measurement errors due to bias, noise, or others. And fourth, each focuses on different sets of nations deepening on the organization's geographical or economical focus. No single source covers all world nations.

Composite indices seek to address some of these issues. Their rationale is that a combination of several sources helps capturing the different forms and dimensions of corruption, thus providing a more comprehensive measure of this complex phenomenon. The aggregation of several sources also reduces the margin of error, assuming that such errors are not correlated (i.e., sources are independent). Nation coverage is also improved tremendously, however making indices interdependent.

The best-known example in this category is the Corruption Perception Index (CPI) that measures the degree to which corruption is perceived to exist among a country's public officials and politicians. The index is based on 17 surveys from 13 independent institutions that gather opinions of businesspeople and country analysts.

The World Bank Institutes' Control of Corruption Index (CCI) is another well-known index that is also an aggregate of several sources. The index

seeks to improve on the CPI by providing more nations, including nations where only one source of data was available. In contrast to the CPI which weights all sources equally, the CCI claims to weigh its sources objectively by attaching more importance to indices that correlate to one another. TI describes the measure as an indicator of perceptions of public sector corruption (administrative and political corruption) and not a measure of corruption levels of entire nations, societies, their policies, or the activities of their private sector. Figure 1 illustrates the relationship between the PCI and the CCI. The indices correlate very well and seem to measure the same aggregate phenomena. Figures 2 and 3 also illustrate the relationship between these composite indices and regular citizen surveys. They clearly seem to measure different dimensions of corruption, national income appearing to have an effect on their scattering.

A common criticism of this framework is that aggregating corruption indicators from numerous sources – with the goal of increasing precision in measurement – does not always produce a more appropriate measure than using a single indicator or data source. One cost that should be considered is the loss of conceptual precision through aggregation (Knack 2006). Gains in statistical precision from aggregating sources of corruption data likely are far more modest than often claimed, because the assumption of independent error in measurement among data sources is violated (Knack 2006).

## General Criticisms and Limitations of Corruption Measurement

Both surveys and expert assessment have limitations beyond those already discussed. They are useful in presenting a general picture of where countries stand in terms of levels of corruption at a given time; however, they should not be mistaken for causal arguments, and their measurements should be looked at more as ordinal rather than continuous variables, thus limiting their statistical usefulness.

Firm surveys can be more appropriate for tracking changes over time than citizen surveys

**Public Administration and Corruption, Fig. 1** Two aggregate indicators based on expert surveys: Transparency International's Corruption Perception Index and World Bank Institute's Control of Corruption. Note that both indices are highly correlated (Source: Author (Murillo))

**Public Administration and Corruption, Fig. 2** Relationship between one of the dimensions of the Global Corruption Barometer and World Bank Institute's Control of Corruption (Source: Author (Murillo))

**Public Administration and Corruption, Fig. 3** Relationship between TI's Corruption Perception Index and one of the dimensions of the Global Corruption Barometer (Source: Author (Murillo))

P

if the survey questions and sample design are identical in both periods and if other factors are controlled for where necessary. However it is important to highlight that these measure only a small dimension of corruption and they suffer of similar bias as citizen surveys do (Galtung et al. 2013). For instance, the surveying of firms and households is not effective in assessing the prevalence of corrupt transactions that occur entirely within the state, for example, when politicians bribe bureaucrats or when funds are illegally diverted. Furthermore, perceptions that corruption is an obstacle to doing business are potentially affected by optimism or by prevailing economic conditions (Knack 2006). Many types of conflicts of interest also are not easily captured by firm surveys, for example, equity stakes of public officials or employment promises to them by firms (World Bank 2000).

Furthermore, in firm surveys and citizen surveys alike, there are difficulties in obtaining honest responses when addressing a social or cultural taboo or an issue in which the respondent has a high degree of complicity (Galtung et al. 2013). Similarly, current political climate fueled by mainstream media, social media, or other communication mechanisms might introduce bias in the respondent's answers. The above biases can be complicated with the particular cultural background of respondents, their level of expertise in the subjects (i.e., education and awareness), whether they live or have lived in other nations, and whether they are rural or urban dwellers. Some surveys might be overly focused to citizens of urban areas, thus introducing further bias.

Likewise, expert opinions about the extent of corruption might reflect the frequency of muckraking media reports, of government anti-corruption campaigns, or of politically motivated accusations by opposition politicians. Ratings by international business people and experts, disproportionately drawn from developed Western countries, might be influenced by Western preconceptions or by the raters' greater familiarity with certain cultures. Some of the organizations that prepare corruption ratings might also have ideological axes to grind. For all these reasons, "perceived corruption" may reflect many other things besides the phenomenon itself (Treisman 2007).

Most importantly, the different measures reflect differences in regard to the nature of corruption. They disagree on the definition, the rigor of the framework and survey, the sample size and characteristics, and the role of culture, among many others. Overall, existing corruption indicators differ importantly in the aspects of corruption they purport to measure, in clarity and breadth of definition, and in the methods and transparency of their assessments. For these reasons, no one indicator or data source is best for all purposes (Knack 2006). The lack of a formal framework that will appropriately capture the concept of corruption stands out in contrast to the practices of measuring whatever dimension of corruption is readily available through existing tools. This leads to large bias and prejudgment that the funding organizations can set upon the methodology and measurement instruments. For instance, poor and simple societies tend to be more corrupt than rich and complex ones; however this assumption largely ignores major corruption in developed nations and the elusive nature of lesser forms of corruption that could have permeated the complex Weberian system in evolved forms. The fact that visible corruption (such as bribes in public service) is more often associated with more primitive levels of economic and political development (Zimring and Johnson 2005) might be an indication that we are conveniently measuring what is obvious and not what is essential. That might be one of the reasons that complexity is associated with lower levels of corruption. Indeed, corruption, being an evolving phenomenon, takes different forms depending on the controls that the system sets, adopting lesser visible behaviors in order to avoid the deterrents and preventions that grow with Weberian complexity (Zimring and Johnson 2005). Perhaps most concerning of all is that the indices are frequently used for policy-making without the requisite reevaluation needed for this new role (Ledeneva 2009). This takes us to innovation in the monitoring of corruption.

## New Technological Approaches to Corruption (Murillo)

If we want to move beyond the general perceptions of a country's overall levels, we find the monitoring of corruption challenging. Until the mid-1990s, most of the empirical findings on corruption in the academic literature were of an incidental or anecdotal nature. The evidence was based on particular, well-defined events or settings. Sometimes this was drawn from fieldwork and interviews, occasionally on legal and other primary sources and quite often on items and scandals reported in the media. The general problem in writing about corruption was that "the facts cannot be discovered, or that if they can, they cannot be proved." Even in our current context, major corruption can only be found through unofficial channels such as leaks, whistle-blowers, "hackers," and other actors; this makes us rethink and ponder of the validity of current indices and also examine the role of modern technologies in incorporating other dimensions of corruption to current measurements.

### The Principal-Agent Framework, Adjusted

To better understand the relationship between the citizen and the government, political scientists have often utilized the principal-agent framework. This framework provides a useful representation of the asymmetric relationship between a government and its constituency, with an informational advantage on the side of the government and authority on the side of the agent (Miller 2005; Lindstedt and Naurin 2010; Spence and Zeckhauser 1971). In this framework, the principal (citizen) delegates authority to the agent (government); however, the preferences of the former are different from those of the later. Corruption is one of the agent's activities that benefits its own interests rather than the principal's (Miller 2005). Transparency is therefore key to holding government accountable (Fig. 4).

Transparency can be categorized using two dimensions: *how* information is released and *what type* of information is released. These can be relevant for the identification and measurement of corruption.

Within the principal-agent framework, two types of transparency are identified, depending on who controls the release of governmental information (Lindstedt and Naurin 2010). *Agent-controlled transparency* is the agent's release of information about its activities as mandated by the agent itself or externally imposed by the principal. This mandate could be self-imposed by the agent in an effort to increase its legitimacy or imposed by the principal in order to increase control, as modern freedom of information or other mandates do. *Non-agent-controlled transparency* is the release of information through the work of an independent and investigative media or other third-party sources such as whistle-blowers. While agent-controlled transparency makes the life of the agent more complicated, non-agent-controlled transparency makes it more dangerous, as it may identify actual instances of corruption and illegal activity (Lindstedt and Naurin 2010).

The type of transparency depends on the type of information released. Two types of

**Public Administration and Corruption, Fig. 4** The agent, principal, and information asymmetry (Source: Author (Murillo))

transparency can be identified, *economic and institutional transparency* and *political transparency*. Economic and institutional transparency is related to the content, accessibility, and usefulness of economic and institutional information. It deals with transparency of economic and financial information, the budget and its process, economic policy-making, and public administration, among many others. It also deals with the implementation of Freedom of Information laws and other transparency enablers (Bellver and Kaufmann 2005; Knack 2006). This type of transparency can be highly relevant in the context of an ever-increasing globalized market and the opportunities for corruption at new scales, which seem to be growing. Political transparency is related to open debate and accountability in political institutions. It relates to transparency in political funding, openness and competitiveness of political participation, independence of the media, disclosure of politician's assets, voting records, etc. (Von Alemann 2004; Bellver and Kaufmann 2005; Knack 2006).

With the principal-agent framework in place, we now identify the various approaches to measure corruption, including what we measure, how we measure, and where we measure.

As illustrated in Fig. 5, corruption could be directly identified (thus measured) by monitoring the agent and the agent's actions at all times. However, this would be prohibitively expensive and unfeasible, as postulated by the principal-agent framework. For instance, some US states have required police officers to carry out body cameras in order to document their dealings while in duty in the field. Similar requirement to all public office holders would certainly make their visible actions more transparent; however, the costs of the processing of information resulting from monitoring the actions, activities, documents, messages, dealings, and other activities of every single public servant would be extremely high. Thus, as the principal-agent framework postulates, gathering complete information on the agent's actions is regarded as prohibitively expensive (and not feasible, at least for now), thus resulting in a preference for shirking.

A second manner of measuring corruption is by monitoring the information that the agent makes available proactively (agent-controlled) and finding incongruencies through different types of analyses, work generally done by civil society, investigative media, or other stakeholders. As the principal-agent framework assumes, the nature of the agent makes him withhold information in order to satisfy its own interests (i.e., hide inefficiency and corruption). Freedom of Information laws and digital technology are facilitating the possibility of having more information available proactively, in a timely manner, and with technical sophistication that would facilitate its processing.

However there are still various barriers to utilize information for measuring corruption. First, in most nations, the availability of information that is relevant for identifying corruption is highly

**Public Administration and Corruption, Fig. 5** The agent, principal, and information asymmetry (Source: Author (Murillo))

reactive, generally obtained through highly bureaucratic Freedom of Information processes that can take a long time. And second, specialized online portals that claim to make governments more transparent are not sharing information that is relevant for the identification of corruption (Shkabatur 2013; Murillo 2014) and are not utilizing appropriate technical sophistication and tools that would allow different segments of the population that identify instances of corruption (Murillo 2014).

There are various technical tools and other processes that could be relevant in making government actions transparent in order to curb corruption. For instance, the utilization of appropriate technical standards and the adherence of global processes (such as "open budgets" and "open procurement") will certainly have an effect in identifying occurrences of corruption; however we argue that these will mostly have an effect in curving corruption or even changing the way that corrupt acts are being carried out.

Actors such as civil society, investigative journalists, and the international community can leverage the processing of data in order to identify instances of corruption. Tools such as "crowdsourcing", technical standards, and even artificial intelligence will certainly help in identifying corruption. While the monitoring of the agent might switch from prohibitively expensive to highly expensive, the evolving nature of corruption might make it even more hidden, to the depths of technical processes. There are some emerging frameworks and limited efforts to measure government's economical and institutional transparency, an important requisite for identifying corruption (Piotrowski 2010; Hollyer et al. 2014; Murillo 2012).

A third manner of measuring corruption is through non-agent-controlled transparency, that is, through assessing acts that are exposed through whistle-blowers, leaks, investigative journalists, or other major actors. The use of these actors to provide governmental information generally signifies that "grand corruption" is involved in such disclosures. Measuring corruption based on non-agent-controlled transparency has two main issues. The first is that it generally measures major corruption (happening at various political and administrative levels of a nation); and the second is that it is highly biased, as the measurement is highly in function of the "capacity" of the nation to disclose information in unofficial manners, which might depend on whistle-blower protection laws. Naturally nations that do not have such laws might be harsher with the different actors present, thus presenting lesser number of non-agent-controlled transparency disclosures. The advent of the Internet, databases such as Wikileaks, and the spread of investigative journalism have been key factors in disclosing corruption instances. Furthermore, with the evolving nature of corruption that adopts lesser visible behaviors in order to avoid the deterrents (Zimring and Johnson 2005), non-agent-controlled transparency might be a key tool for identifying major corruption acts.

In conclusion, despite the increasing ease of sharing information through the Internet, the lack of data and the high cost of monitoring the agent impede progress. However, as the bureaucratic process gets more automated and as technical tools gradually become part of human interactions, the identification and measurement of corruption through agent-controlled transparency might become a reality (Galtung et al. 2013; Murillo 2014). Thus, for now, we are obliged to utilize indirect methods and proxies in order to measure corruption or, properly put, perceptions of corruption. This is done through representative surveys of service users, expert assessments, and composite indices composed of the above methods, when data is available (Knack 2006; Ledeneva 2009).

More comprehensive measures of corruption should include objective measurements (of what is actually occurring) and subjective assessments (of how those involved perceive or understand what is occurring). The information is needed because the reactions of people to anti-corruption efforts will be governed by their own perceptions (Galtung et al. 2013). Therefore, the cultural approaches to culture also underline that compliance should be norm based as much as enforcement based. The two should in fact be mutually self-reinforcing (Hira and Shiao 2016). Thus,

culture and norms can be reconciled with the economic approaches.

## Corruption, Development, and Globalization (Hira)

Corruption is synonymous with underdevelopment. Throughout the developing world, the ineffectiveness of government remains a major impediment to economic growth and citizen satisfaction. Corruption leads to declines in and misallocation of investment (Uhlenbruck et al. 2006). Concerns about corruption have led to ongoing spontaneous protests throughout the developing world, which increasingly evolve into more organized anti-corruption movements, such as the Hazare movement in India which sprang up in 2011. While NGOs such as Transparency International play a valuable assisting role, the role of international organizations and multinational corporations (MNCs) is more scrutinized.

By their charters, the World Bank and the IMF can not engage in domestic politics. Yet, their activities speak otherwise. Numerous reform efforts, often tied to meeting international debt obligations, have followed the logical lines of creating a Weberian type bureaucracy, meritocratic, transparent, and accountable to national interests. Moreover, since the 1980s, increasing emphasis has been placed on reducing the role of the government, including extensive privatization of state-owned enterprises, aka neoliberalism. The World Bank's own governance indicators have become a primary means to measure corruption. Measuring items such as days to open a new business, the indicators reflect the difficulties created by both bureaucratic inefficiency and corruption. At the same time, such surveys (including that of Transparency International) are often accused of being biased toward Western interests in market liberalization, to assure investors. As a result, the efforts have more recently attempted to engage in citizen surveys and broader indicators to reflect more domestic sentiment. Yet, the choice of indicators and how they are reported and used, despite warnings by the issuers, remains controversial. There is no indication based on indices that neoliberalism has had any effect on levels of corruption. In broad terms, international organizations as well as foreign NGOs have to deal with host governments in order to be able to operate, thus exposing them to tacit cooperation with often corrupt entities.

Certain international organizations have taken a more active stance. The United Nations, for example, created the UN Global Compact in 2000 to set up principles for MNC activity, including reducing collusion for corruption. The UN has also set up certain organizations such as CICIG (International Commission Against Impunity in Guatemala) which have acquired quasi-legal status, at the behest of the host government, to fight corruption and human rights abuses. The International Criminal Court, set up to deal with the latter, does not have any mandate for dealing with corruption.

Findings on MNC activities are blurry. MNCs are routinely accused of shady deals with corrupt governments, with trillions unaccounted for, such as the recurrent scandals around Nigeria's oil industry or many arms deals. MNCs often counter that they are merely following local practices and have a better record than domestic counterparts. Statutes in the West designed to curb such practices, such as the US Foreign Corrupt Practices Act, seem to have quite limited practical effect in reducing corruption. Some would go further and state that even some legal mechanisms, such as export financing, amount to effective subsidies. However, countries wanting to curb such practices find their MNCs complaining that they will be shut out of such markets by their competitors, including those from emerging markets who face minimal pressure, if they do so. MNCs frequently use their global nature, for example, through transfer pricing to subsidiaries, to reduce taxes and hide transactions from prying eyes. In turn, governments seeking to crackdown on unwanted MNC behavior face the possibility that they will lose work to countries willing to look the other way. In line with the Global Compact, MNCs have ubiquitously adopted corporate social responsibility platforms. However, analysis of such behavior indicates haphazard, at best

compliance, even when there are third-party monitors (Hira and Benson-Rea 2017).

The problem for curbing corruption on a global scale is even more daunting, given the setup of the global financial system. As revealed in reporting around the Panama Papers emerging from a hack of a legal firm in 2016, individuals and companies everywhere freely use non-reported offshore banking havens to hide assets from tax collectors and for use in illicit activities. Despite some increase in reporting requirements following the 2008 financial crisis, Western government are still unwilling to close down such havens.

## Conclusion and Recommendations

Developing countries clearly lack or are underdeveloped in terms of accountability and transparency, ranging from property rights to independent judiciaries. Yet, attempts to create such institutions as meritocratic recruitment have generally met with resistance, which can be explained by deeply embedded cultural norms. In considering the economic vs. the cultural approaches to corruption, we find that both work together. In the development of rule of law and good governance in the West, cultural and bureaucratic norms were established that were then reinforced through legal sanctions. The occasional scandal that grabs media attention in the West and bigger questions around campaign finance and procurement contracts demonstrate that such norms are not only alive and well, but necessary for a legal regime to be effective. Emerging measurements of corruption seek to combine elements of objective transparency and accountability with perceptions, addressing the principle weaknesses of both survey- and expert-based assessments. The development of the internet also holds promise for increasing transparency, for example, by making budgets and procurement contracts publically available.

Acknowledging that culture or group norms have a direct impact on levels of corruption is not the same as finding causal mechanisms that would suggest reforms (Licht et al. 2007). Examining the history of anti-corruption in the West reveals that rule of law evolved over centuries and that vigilance must be constant. History cannot be reproduced, thus suggesting that while there may be some general lessons, it is likely that each region, or possibly each country, must find its own way forward. Complicating the situation even further in developing countries is the fragile nature of their states, postcolonial, and fragmented along ethnic, religious, and class lines; traditional institutions persist in the shadow of formal Western ones (Hira 2016). The persistence of institutions over long periods of time suggests a far greater effort is needed to make inroads on corruption (Acemoglu et al. 2001).

# Public Administration and Gender Issues

Lynda Boswell
International Public Policy and Administration, and Monitoring and Evaluation Expert, Stratton, CO, USA

## Synonyms

Bureaucracy; Gender-women-females; Governance; Laws; Organizational development; Public administration-policy

## Definition

Public administration refers to the surface mechanics of establishing governance and policies, through institutional development, regulations, laws, implementation, and policies. Gender refers to women or females. Genderizing refers to making distinctions based on gender.

## Introduction

As a student and practitioner of public administration, gender was not a specialized topic. The study of classic public administration included structure, bureaucracies, activities, responsibilities, and organizational development (Stillman 2009). In addition, education in the United States on public administration concentrated on surface values and construction of public administration (Shafritz and Hyde 2011). Gender did not have a specific role, be it positive, negative, or neutral.

The experience of genderizing seemed to gain prominence through the recent establishment of the constitutions in Iraq and Afghanistan after the United States provided much influence. Gender became a political issue and memorialized as a public administration issue (through the use of quotas in elections). Although the United States touts its foreign aid policies to enable recipients to have a more inclusive government with female quota, this would not be something that the United States would have in its own constitution.

The purpose of this entry is to provide a more global overview of public administration and gender in the context of the international arena. Though the Middle East region may or may not have issues in gender inclusion, Western and Asian arenas have their own issues regarding gender. Encouraging inclusion of gender in public administration would be a common sense approach, and unfortunately, this is a case of "do as I say, not as I do." Surprisingly, we will find that some of the more conservative (e.g., monarchies or Islamic) countries (or those deemed as non-democratic) are more inclusive of gender in public administration. The type of governance is not as important (i.e., dictatorship, democracy, monarchy, etc.) as understanding the benefits of including gender roles in international public administration (Bertucci and Alberti 2005, Frankfort-Nachmias and Nachmia 2008).

## Fundamentals of Public Administration

In the study of public administration in general, distinctions are made in terms of the regional study of public administration. Denmark focuses on Europe and the Western world. The United States and Australia have specific exchanges with China in its public administration program, differentiating the Chinese element. Turkey and the Middle East also have their concentration specific for the area and international borders close to them. The same goes for Latin America, Russia, and any other region not specifically mentioned. The common thread among the country-specific specializations of public administration is structure, organization, compliance, and implementation. Regardless of the region and type of government, these four elements are consistent.

In every government is a structure, and in this case, it will be the type of government. The traditional types of government today include democracy, republic, monarchy, anarchy, authoritarian, commonwealth, communist, aristocracy, dictatorship, democratic republic, ecclesiastical, emirate, federal, socialism, theocracy, Islamic republic,

totalitarian, and a few more. Combinations of types of government also exist in which even a communist government provides for democratic elections. Democratic governments provide for oligarchy direction. Theocracies become inclusive of secular laws. Government structure is fluid and so is its definition. In any government structure, a leader or leaders exist. Regardless of the state or continuum of a government structure, agreement in all regions is the recognition of the various types (and hybrids) of government that exists today.

Once the structure is known, the next major foundation of public administration is in its organization. Organization is a very broad topic. Heady (1991) did a good job in bringing forth a way to examine some common themes for comparative public administration. Here, the diversity of organization becomes apparent in the hundreds of ways in which one organizes types of government from the views of culture, development, bureaucracy, political parties, classical administration, religion, causes, etc. Again, the possible ways to organize a type of government also are multitudinous.

Included as a foundation of public administration is a semblance of compliance. This means that those who are active in the type of government, through its leadership, bureaucracy, involvement, organization, and contribution, agree toward a set of goals, whatever that may be. The goals could be making the leadership look good, or to ensure the citizens do not get agitated, a benevolent or social program, keeping one's power in the organization, trying to upend the leadership or government. Regardless of the reasons for compliance, good or bad, a group of individuals will move forward to comply with and move to advance the purpose they see.

Finally, through this very bare-boned foundational aspect of public administration, implementation is the last key. Here, the classics and neo-modern elements of Western public administration begin to have relevance regardless of structure, organization, and compliance. Perry (1996) systematically lays out several elements for implementing public administration. Along with the works collected by Shafritz and Hyde (2011), focus turns to the individual actors as public administrators. To bring implementation to one more level, Cooper and Wright (1992) focus on individual acts of public administrators through examining character and leadership.

The following section focuses on the last part of the foundation of public administration, and that is implementation of public administration through indirect, direct, and bureaucratic involvement of women (Bustelo 2003). Many women throughout history and current have amazing contributions to public administration; however, for the purposes of this entry, a few are highlighted with the hopes of sparking renewed interest in going further than what is written here. Also, many sage authors of public administration and incredibly capable studies exist in this forum (Schachter 2011, Stivers 2002), that much of the seminal works in this growing area were not included. This is not to slight or ignore those important works, and the nature of this entry is to pique interest, challenge, and encourage further examination.

## Models of Public Administration and Gender

### Gender Influence: Indirect

For a monarchy, Jordan is a positive example of female contributions through its Queen, Rania. Though not a direct political player, she is involved in the governance through portrayal and representation of women in general for the causes she is involved in. She empowers women as the Queen to a benevolent King because she demonstrates that she can be a strong Muslim woman who can bring about positive social change within her community, which happens to be Jordan. Perhaps she tempers him, or he ensures she flourishes as a woman, her involvement in public causes provides positive influences in Jordanian governance. Although the Middle East, and especially Jordan, is still ranked low in global gender gap (World Economic Forum), it does not portray the level of involvement in public administration, either governance or bureaucracy. In this, those areas, Jordan, and especially Queen

Rania's indirect influence provide positive contribution to the causes that are important to her, health and education.

Another indirect influence was that of Masako, the Crown Princess of Japan. With her Western education, lifestyle, leadership, and activism, many young Japanese women hoped for change with her marriage to the Crown Prince of Japan. To the disappointment of those women, the fact that she has demurely accepted her role as the same as many before her, in the lack of any activism, leadership, or positive role model in influencing public administration, it is no surprise that representation and respect for women are not encouraged. If the Western educated confident princess cannot speak her voice, what chance would any woman? Although the country's traditions do not allow the princess to be engaged in public causes, it does not make her mute. In contrast to Queen Rania and King Adbullah II of Jordan, malnourishment of a woman's natural leadership in areas she is strong in may contribute to her declining health. At the least, Crown Princess's silence continues to contribute to the pressures and silence of Japanese women.

### Gender Influence: Direct

Notable direct players in public administration are the elected or appointed leadership of women in several countries. Chosen for inclusion in this entry are South Korea, Turkey, the United Kingdom, Germany, and Pakistan. Some are good examples and some are controversial or even bad examples.

Time will tell the legacy of South Korea's current leader, Park Geun-hye. She was one of the most powerful women in East Asia, and the first being democratically elected. She has had the opportunity to be included in the public administration of her country through her political party, parliamentary representation, and familial legacy. She brought compassion during the difficulties of the assassinations of her parents, and realization that he father may not have had the country's best interests through his purported human rights abuses in South Korea. Despite violence against her, her responses were compassionate and have won the hearts of her fellow citizens throughout her political journey. She has been able to bring attention to gender issues to the national forefront as part of social policy. Her inclusion in public administration has had a positive effect thus far in advancing the voice of women and their issues in South Korea Despite these notable accomplishments, she was being impeached.

Tansu Ciller's leadership in Turkey as the Prime Minister was an example of strength and elegance. Even after Ciller was no longer in office in the early 1990s, women have increasingly had opportunities in areas such as education, employment, and rights. During her time in leadership, Ciller was perceived to be strong because of her position in public administration and provided hope for other Turkish women in leadership. However, her critics claimed that she used her femininity and was unsure (Kesgin 2012). The same critic would go on to say that the evidence laid with her not challenging the military during the PKK uprisings and was less than average in terms of Turkish leadership. Regardless, for the area of the world she was in, the fact that a woman led Turkey was an accomplishment. The values of the founder of Turkey (Ataturk) which among others included education, political rights, and social justice for both women and men did not fade with Ciller's leadership but continued in those legacies.

Margaret Thatcher from the United Kingdom was a direct influence in public administration through her political positions, which culminated in her leadership as Prime Minister. Her greatest legacy was the enduring mark she has left in the UK government, through policies, determination, and even in her resignation. Her direct involvement in not just politics but in policy-making, whether popular or not, demonstrates that her position in leadership was not less nor more than any other of her male counterparts who came before her or after her in terms of the citizens' like or dislike of what she has done or promoted. Known to be abrasive, she managed a war with Argentina and would be considered a nemesis to anyone she would strongly disagree with in terms of her politics or position. Inadvertently though, Margaret Thatcher provided an avenue of encouragement for women in the public administration sector.

Germany's appointed Chancellor, Angela Merkel provides an interesting contrast in public administration. On one hand, she started out as an administrative bureaucrat in East Germany and then elected after the German Reunification in 1990. Later she would be appointed as the Minister of Women and Youth. In 2005, she became the Chancellor. On the other hand, she has been criticized for not bringing forth more policies in gender equality, and she is not considered a role model for women. This dichotomy is the very reason why public administration should be more inclusive of women. Including women does not mean including feminism, feminist agendas, or even pushing forth women's rights. Including women, however, does mean that strong women, like Angela Merkel, have influence in politics for the good of her constituents, which also include men and Germany in the world arena. Like in indirect influences of women in public administration, her interests may not be in those feminist agendas, but potentially world leadership, and most certainly leadership and stalwart of the European Union. No one doubts the power of Germany, and that power is a woman who was afforded the opportunity to be involved in public administration.

The leadership of Benazir Bhutto in Pakistan was an accomplishment in the field of public administration in a Muslim nation. Despite the allegations of corruption charges, and difficulties during her first reign, her party did lose the seat that put her in power in the first place. During her second reign as Prime Minister, more of her family members became embroiled in corruption scandals that would eventually lead to not only legal charges but also to a self-imposed exile. Her causes for empowerment of women through education, employment opportunities, and family planning provided hope for women in Pakistan. Her attempts to tie in both the West and Islamic ideology in politics were also a hope that was unfortunately derailed through the actions of the Pakistani parties (including hers) and her assassination. Bhutto was not merely a woman who became a Prime Minister, but she created a momentum to influence politics in Pakistan even after her death.

### Gender Influence: Bureaucracy

Several authors argued for a logical explanation in having a broader gender inclusive bureaucracy: it levels the playing field for a variety of causes, policies, and general public administration. What has been unfortunate is that certain public sectors have an overabundance of women that presumes a woman's role (which is not what is meant by inclusion) such as education, gender issues, and health care. Although those areas are important for women to formulate policy direction, women should be included in other areas such as budgeting, social policy, defense, and culture. Keiser et al. (2000) concluded that increased participation of women in bureaucracy can lead to active participation in forwarding gender positive issues or problems.

Some countries have female quotas for representatives in government, and others encourage the hiring of females in the bureaucratic systems. Whichever manner a government chooses to encourage participation of women in public administration, those efforts generally provide positive results in terms of balancing and prioritizing the needs of a country. That is not to say that having an all-male governance is not equipped to understand or handle some of the societal issues that can only be solved through government, but it is to say that even with a multitude of male-centered solutions, women could offer different perspectives to enhance and consider for the contribution of its citizens (Meier and Funk 2016). Although there have been critics to quotas and efforts such as affirmative action, regardless of the target of those quotas, inclusion benefits the community.

## Female Leadership

Public administration and gender does not presume that every woman who steps into any government role, be it direct, non-direct, or bureaucratic will be a leader (Schachter 2015). In some areas of governance, expectations of a woman (rather than an employee or leader) can get in the way of building coalitions, advocacy, and workplace environment. Some of those

expectations include the sexuality of women, roles that are in servitude of men (serving tea and coffee), being silent, tolerating inappropriate behavior by other staff, etc. As many problems women may or do face in the field of public administration, benefits and overcoming those problems will lead to a more productive bureaucracy.

Thanks to the compilation of Leadership provided by Hickman ed. (2010), one particular article, defined universally the problems women face in leadership (Eagly and Carli 2010). Briefly mentioned in this topic are elements eluded to which included words such as demure, compassionate, abrasive, nurturing, perceptive, and intimidation. When describing any woman in the context of her abilities as a public administrator, though some of those words would be positive in different environments, they do nothing to describe her actual ability in the performance of her task for the good of the organization.

Hinted at earlier was the implementation as one of the foundations for public administration, and implementation is a personal journey. Many examples of good public administrators have characters and qualities that are not gender-centric, i.e., any man or woman has the character and leadership that make them exemplary. Different types of leaders and staff work at all levels of government from the highest to the lowest (Wren 1995). Again, this crosses all regional public administration boundaries from around the world. Implementation crosses all areas of any government structure and organization. Therefore, since implementation is a personal journey, and every man and woman who serves in this capacity has its own quality to bring to governance, then gender in public administration would only strengthen the existing structure and provide perspectives through a gender-inclusive public administration.

For women who wish to build on their leadership skills, several excellent public administration and general leadership books and articles exist. In mining the different aspects and ways to lead, even types of leadership depending on situations, it is important that she does not lose herself in all that she may find she would like to do, but to keep in mind staying true to her character and recognizing effective and ineffective ways to promote change in the situation and in herself. A woman will have fans and detractors in her role within public administration. Just like in any political situation, even a man surrounds himself with those who would benefit him and his cause, likewise this is not any different from a woman. The situation in serving a leadership role in public administration may be more or less difficult, depending on which region one is serving, and gender inclusion allows for a more full understanding of how women navigate their careers in this sector.

## Conclusion

Some countries have chosen to memorialize the inclusion of gender within public administration through election quotas and preferences in hiring women. More of the Middle East and Central Asia have these female election quotas, whereas the more democratic (Western) countries do not. The reasons for this are not known and will not be explored here. Many in the Western arena do have policies in action to increase female opportunities in public administration fields, whereas other regions do not. Regardless of how a country genderizes it government, any time these efforts lead to more women involved in the governance of the citizens, it rounds out the potential for a country to view women as partners and to have more equal partnerships within its policies and laws (D'Agostino 2016).

Having a more gender-inclusive governance is not the panacea for good governance. Regardless of gender, corruption and bad motives will always exist when it comes to ruling over citizens (Henry 1995). Genderizing is way to provide balance and voice, good or bad, to allow public administration to play out (Clark 2000, Dolan 2000, Kabir 2013, UNDP 2014, 2016). Implications of including women are the typical stereotypes of nurturer, compassion, inclination for less violence, and balance against male stereotypes of aggression, selfishness, and egotism (Eagly and Carli 2010). This is not to say that women do not have the negative

stereotypes of men and that men do have the positive stereotypes of women. Genderizing provides more balance than exclusion of women in public administration. With bad or good intentions of female inclusion, it is still better to balance public administration in general in the increased likelihood of a positive contribution to governance (Cantarelli et al. 2016, Durant and Rosenbloom 2016). Much room exists to expand on any areas written here. However, the conclusion will remain the same, that public administration and gender, taking on the many flavors or regions, and governments, have positive contributions for those willing to respect the intelligence and perspective a woman brings to governance.

Bureaucracy; Policy process; Public good; Public management; Public service

## Definition

Public administration deals with formulation and implementation of government policies for the public good and for the betterment of the general populace in all countries. The linkage of public administration to governance is seen if greater number of the populace benefits from governmental actions and inactions, which are implemented in the form of policies through the bureaucracy.

## Introduction

In the realm of determining the success of states and nation-states, it becomes compelling to examine the processes of governance and public administration responsible for the success or otherwise of such states. Through the study of the modes and operation of administration and governance, it is possible to project into what the future of a state leaning on past and present experiences in determining the future. However, it is never enough to examine oneself without juxtaposing one's reality with that of other contemporaries.

Comparison essentially involves placing side by side the predominant realities between states in a bid to reach conclusions and make inferences into the future of states. Admittedly, comparison can take different forms, it could be carried out between two or more states or between one state and more than one other state, and it could also be between histories, economies, and systems of government, for example, a democracy state could be compared with another or a dictatorship with a monarchy. It is however noteworthy that no two states can be exactly the same no matter the degree of similarity nor completely incomparable no matter the extent of difference.

Nigeria and South Africa are two African nations considered to have been competitors and rivals in diverse areas, ranging from standard of living, good governance and administration, and music to sport and social cultural life, among many others. Historically, both nations are related on certain degrees of ties, interaction, and conflict periods including Nigeria's prominent role during the South African apartheid and the xenophobic attacks against Nigerians living in South Africa.

Other than these, the attention of researchers and public commentators is often more drawn to the process of governance and public administration in each state, and often, comparison is made among a myriad of elements surrounding the public administration and state governance. This paper examines the situation of public administration and governance in each state and thereafter makes comparison between the two largest economies in Africa in terms of public administration and governance with practical policy options and recommendations.

## Understanding Public Administration and Governance

Public administration is related to government and society. The word "public" connotes that which is separate from personal or private life; it has to do with that which is general, which is relating to or pertaining to everyone within a state as opposed to personal or group affair. Administration is an organizational term which relates to the process of carrying out the will and

agenda of the organization, but in the case of this paper, the state is considered as an organization.

Public administration therefore suggests the arrangements and structures through which public values, goods, or services are generated, administered, and delivered. As a field of study, it refers to the academic discipline which studies the mechanics or structures through which government plans and implements its programs. The main thrust of public administration as an academic discipline is the development of a public sector organization theory different from the intellectual leaning of private sector organization theory and market principle (McLean 2003).

Summarily, public administration can be seen as the utilization of theories and principles of administration in the public realm within a state. It has to do with the application of administrative logic in the running of a state, viz., the making and implementation of government policies in view of effectively bringing the state to its full and sustainable development goals.

Relatedly, governance is one of the most popular concepts in the field of political science; its relevance cuts across all forms of organized groups and institutions upon the globe. The term "governance" finds its etymology in the ancient Greek, and it literarily suggests "control," "steering," "guiding," or "maneuvering a ship or a land-based vehicle." From this, it can be deduced that governance has to do with the process of control or the existing structure, set of operational rule, and regulation within which public administration is expressed.

Governance is a system through which "power is exercised in the management of a country's political, economic and social resources for development." The emphasis here, according to the World Bank, is "the use of power to control political and economic resources of the nation." Thus, governance is about securing political power in order to control economic power for the purpose of nation's development. While the definition is true to the developed nations of the world, it is far from being true in the third-world countries, especially in most African nations. Most African leaders cannot differentiate between private and public organization; they run nation like their personal businesses and corner nation's wealth for themselves and their cliques (World Bank 1993).

The essence of governance is not merely in its existence within a state but in its quality, its proficiency, and its degree of successes, and the basic examination is if the governance is good or bad. Therefore, the United Nations Development Program (2002) declared that "good governance" is about striving for the rule of law, transparency, equity, effectiveness/efficiency, accountability, and strategic vision in the exercise of political, economic, and administrative authority. In other words, it could be seen as a process where public officers and institutions conduct public affairs and manage public resources effectively through the above-listed conditions.

## Public Administration in Nigeria and South Africa: An Overview

The United Nations Development Program (UNDP) lists five areas to achieve good governance goals. The first is governing institutions followed by civil society organizations, decentralization and support to local governance, governance in special circumstances, and public and private sector management (Governance for Sustainable Human Development 2005). In a similar direction, public administration is only considered to be effective to such an end if there is sufficient availability and equal distribution of state values and resources. It is expected that the rendering of public services must be without bias or prejudice as well as void of manipulations, abuse, or misuse of administrative offices and privileges. Although each of public administration and governance has distinct and peculiar challenges in states, it is however true that most of these issues are closely related. This claim is exact in African states where similar problems plague governance and public administration and it is in this perspective that Nigeria and South Africa are discussed below.

## Public Administration and Governance in Nigeria

Having celebrated 60 years of independence from colonial rule, Nigeria has drawn the attention of

citizens, political scholars, researchers, and international actors. The reason why Nigeria has attracted so much attention is not a far-fetched, and this is due to the fact that the West African state is richly blessed in both human and natural resources as well as having a good climatic condition, encouraging an influx of foreign investors and multinational companies to the country. An observant thinker will readily agree that Nigeria has all it takes to become one of the leading nations in the world in terms of development. However, the irony of the Nigerian state has attracted great concern in recent times as to why such a naturally blessed and humanly buoyant entity could be listed among the poorest nations of the world. The situation of Nigeria can therefore be paradoxically expressed as "so rich, yet so poor."

The decadence in the structural operation in Nigeria is a true reflection of the poverty level in the public administrative and governance substructures of the republic. The plagues and pitiable situation of the "Giant of Africa's" governance and public administration are discussed below.

1. **Bribery and Corruption**
   Bribery and corruption in Nigeria stand as a chief plague eating grievously into the nation's political and economic image. Bribery and corruption in Nigeria range from public servants accepting bribes, grafts, and gratifications for carrying out their lawful duties to inflation of contract awards so as to collect kickbacks from contractors in return. It also ranges from embezzlement and misappropriation of public funds to direct looting of the treasury (Achimugu et al. 2013). For example, the sum of five billion Naira (N5b) was allocated to nonexistent agencies in the 2010 national budget (Nigerian Tribune 2010). Furthermore, crude swaps due to subsidy and domestic crude allocation from 2005 to 2012 indicated that 11.63 billion US dollars were paid to the Nigerian National Petroleum Corporation (NNPC), but there was no evidence of the money being remitted to the federation account. The challenges posed by bribery and corruption have and still lead to other problems like poor remuneration of workers, strike actions, unemployment, increase in crime rate, and so on.
2. **Rigidity and Red Tape**
   Another difficulty that characterizes the failure and ineffectiveness of Nigeria's public administration is bureaucratic rigidity. Bureaucracy in Nigeria is yoked with excess adherence to protocols which have down turned its effectiveness and efficiency. Extreme strict adherence to rules, policies, and procedures produces timidity, conservatism, and technicism in the public servants. Besides, formalism and ritualism prevail in societies or organizations in which members cling tenaciously to bureaucratic principles and practices; this is the case in Nigeria, in the words of (Ezeani 2005).
3. **Crimes and Insecurity**
   Safety and security of lives and property are necessary for the development of a nation. However, Nigeria is currently bedeviled with the problems of crime and insecurity. The vices manifest in frequent cases of armed robbery, pen robbery, religious riots, inter-ethnic clashes, youth restiveness, political thuggery, rape of women, Boko Haram insurgency, ethnic militias, secret cult activities, herdsmen attacks, child trafficking, kidnappings, and a host of others (Njoku 2007). These are serious issues of concern as they make lives and property unsafe and threaten to dampen the country's quest for national development. In the same light, the government seems not to be really bothered as the cases of crimes, terrorism, and other vices are on the increase daily.
4. **Political Leadership and National Consciousness**
   The whole of essence of leadership is to bring about a formidable energy and motivation geared toward the attainment of the state will for the benefit of all citizens. However, it seems like the reverse is the case in terms of governance and administration in Nigeria as older citizens narrate the stories of "the good old days" to the younger ones; this is highly connected with the dwindling state of quality leadership, mirrored by the high rate of mismanagement and syphoning of public fund for personal use as well as abuse and misuse of political power due to the absence of national

consciousness. National consciousness is a mind frame that captures the whole state as one entity, as one unit and people notwithstanding the obvious diversities displayed in terms of cultures, ethnicity, religion, social status, language, political affiliations, and so on.

Regrettably in Nigeria, political leaders grossly lack national consciousness, and this also certainly contributes to leadership challenge in Nigeria as leaders in Nigeria tend to be more conscious of regional, party, and/or, amazingly, personal interest and they appear to be either clouded or completely veiled from seeing the whole essence of the country being one. Apparently, many national leaders irrespective of the conspicuousness of their offices and the sensitivity of their disposition in national matters portray themselves either overtly or silently as warriors in pursuit of sectional or personal portion of the "national cake."

5. **Political Parties, Godfatherism, and Other Related Issues**

As already established, good governance and effective public administration are only expected when there is good leadership and political parties play an inalienable role in the supply of quality leadership for different political offices across all democratic states of the world. However, Nigeria seems to reveal a reverse case as political parties have not supplied quality leadership as expected.

Amid numerous challenges surrounding political parties and leadership supply in Nigeria, godfatherism stands in a very conspicuous position. Without doubt political mentoring is a natural reality in political life as more mature political actors train and guide upcoming once. However, political mentorship in Nigeria has been changed into political lordship, political grand mastership, and party dictatorship otherwise called godfatherism – a palmerworm in Nigeria's party system, where certain individuals sustain hegemonic relevance and control. The prevalence of political godfathers has grossly grown and abused overtime. The so-called godfathers sit in elevated platforms, determining what goes in and out of political parties, party members or aspirants, and by extension the entire political landscape of the nation, thereby frustrating the natural running of the state.

Another prominent attack against leadership in Nigeria is the issues of excessive cross carpeting and lack of party ideology. The absence of a standard party ideology results in directionless leadership. Cross carpeting is another major one as politicians shuttle parties especially in electioneering periods. In these periods, politicians change parties like "transit buses." This regrettable act finds expression in virtually every state in the federation with the most recent occurrences in Edo and Ondo states at the eve of the 2020 election in each state. In Edo states, two opponents shuttled between the two main political parties in two successive electioneering sessions of 2016 and 2020. The event in Ondo state is a little more dramatic as the serving deputy governor contested against his boss huddling through two other parties before finally attaining candidacy ticket. These dramatic events are product of the party indiscipline, lack of ideology, and porosity in Nigeria leading to poor leadership supply. Other prominent problems include vote buying and the party-to-party allegiance (smaller parties have affiliations with either of the "big shots," viz., Peoples' Democratic Party and All Progressives Congress, which currently contends for national hegemony in Nigeria).

## Public Administration and Governance in South Africa

South Africa is one most the influential state in the continent of Africa. This influential is regularly attached to its trade relations investments and political engagement in the region. Another notable feature of South Africa is its large and highly most diverse and developed economy compared with many other African countries. The struggle and victory against apartheid also give it fame across Africa and beyond the continent.

However, like their Nigerian counterparts, South Africans are grossly uncomfortable with

the state of public administration and governance in the state. Very often has the South African government been accused of deficient delivery of services to citizens. This dissatisfaction appears to be an African reality or a black man syndrome. Like Nigeria, it is naturally expected that South Africans should enjoy the dividend of effective public administration and good governance. This is due to the natural, human, and industrial advantage that the country boasts of, but in reality, governance and public administration are far behind the expectation of the masses and other international observers. Some obvious challenges are thus explained below.

1. **Xenophobic attacks and economic hardship**: The xenophobic attacks in South Africa have proven to be a product of economic hardship; South Africans seem to be in affliction in their own country; they feel cheated as foreigners take over their business and wealth; this is a clear revelation of poor governance and public allocation of resources. The very attacks appeared to be beyond the control of government as foreigners especially Nigerians were killed and their businesses destroyed and burned into ashes. This claim finds a similar trace in history, for example, the killing of Jews in Nazi Germany is perceived to be a product of poor governmental administration leading to ill feelings toward foreigners; a similar occurrence is recorded in Italy under Benito Mussolini's fascist control as well as Nigeria's "Ghana must go."
2. **Political actors and corrupt practices**: In a bid to examine the success of governance and public administration performance, one cannot but come to the sad conclusion that South Africa has done well enough in the fight against corruption. This is revealed more obviously in that no accused public officers in South Africa have been brought to book or convicted whether serving or retired. It is submitted therefore that, in the absence of more appropriate political governance and the flushing out of corruption, the transparency policy being sought for will never be attained.
3. **Economic diversification**: One of the most profound successes attributed to South African government is economic diversification, blessed with abundant natural resources, the nation, more than many other African countries has proven not to be fixated on one commodity as the main source of income; also South Africa is known to have more international presence with the existence of companies like ShopRite, DSTV, Sasol, Stanbic Bank, MTN, and so on. This is an enviable feat which sends an important lesson to other African states but might question the benefits South Africans enjoy from it.
4. **Access to social amenities**: The South African government has often been accused of not delivering services to its citizens. The mass media have reported on service delivery protests that are indicative of inadequately addressed problems in the public sector. These protests cannot all be blamed on municipalities' perceived dismal performance – it is evident that something more serious underlies these problems, possibly involving underperformance in all spheres of government (Carrim 2009). The presence of inept public servants and the absence of accountability and poor human resources practices alongside poor leadership led to poor service delivery.

## Comparing Public Administration in Nigeria and South Africa

In a bid to make a clear comparison between public administration and governance in Nigeria and South Africa, it is imperative to note that certain similarities and differences shall be examined accordingly. Some of these numerous similarities and differences are discussed below.

## Similarities Between Public Administration and Governance in Nigeria and South Africa

1. **Corruption and illegal practices**: Without doubt, corruption and all its "siblings" have

found a breeding place in both Nigeria and South Africa. Within administrative walls, corruption seems to have built an edifice which expands massively as years run. It is in fact saddening that the more institutions are created to confront corruption, the more this cancer multiplies. One cannot but agree that successive governments in the two states have made efforts to eliminate corruption, but in practice, it's quite clear that these institutions are tools in the hands of current governments to bring down past political enemies while they continue in the same path with protection from the same institutions; it is therefore not surprising that these institutions themselves are highly corrupt with internal decadence, bribery, and abuse of powers.

2. **Leadership and administrative challenges**: It is possible to assume that successive changes in states' government are definitely bound to bring about improvements either by multiplying the success of previous leaders or introducing positive changes amid the failure and ruins caused by past leaders. However, to a very large extent, the case of Nigeria and South Africa seems to be a story of running with the same cycle with very meager improvements.
3. **Unemployment**: Both Nigeria and South Africa are characterized by high rate of youth unemployment. The teeming population of youths in both countries appears to be grossly unemployed. Although there is a popular reality in most African and third-world nations, it is however embarrassing that the two leading African economies wallow in the same shackles of high-level joblessness.
4. **Bureaucratic difficulties**: Another area of similarity between Nigeria and South Africa is excessive adherence to protocols; this has proven to be the strongest limitation to policy implementation processes in the two nations. The challenge of stiffened bureaucratic method is known to be a killer of initiatives and idea executions. A more alarming surge surrounding this excess use of official protocols is the prevalence of the "man knows man" (nepotism) and state capture (Afolabi 2019).
5. **Service delivery inefficiency**: Clearly, in both countries, the delivery of basic social services is on a downturn trend as citizens daily complain of limited supply or total absence of basic social amenities and services. This is revelatory of the claim that African countries are terribly backward if citizens of the two largest economies barely have access to their basic need as should be provided by the governments.

## Differences Between Public Administration and Governance in Nigeria and South Africa

1. **Diversification of Economy**
   One distinction in public administration and governance between Nigeria and South Africa is diversification of economies. The two nations are clearly blessed with natural resources, but it is the case that South Africa sustains a more diversified economy than Nigeria. South Africa has the most diversified and industrialized economy in Africa, while Nigeria seems to be completely dependent on a commodity (petroleum) although there exist other numerous means through which the nation's economy can be advanced.
2. **Standard of Living**
   In recent times, especially years before the xenophobic attacks in South Africans against Nigerians, it was observed that hundreds of Nigerians took to their hills outside Nigeria while South Africans in diaspora headed back to their country; these events point attention to the huge difference in the observable standard of living in Nigeria compared with South Africa. South Africa ranks about five times more of GDP per capita ahead of Nigeria. Although it is not at its best, the standard of living of South Africans outweighs that of Nigerians by far.
3. **Natural and Human Resource Management**
   The population and resources naturally available in Nigeria are in multiples to that of South Africa. For instance, the population of Nigeria stands at over 200 million compared to

South African population that is slightly less than 50 million. Also, Nigeria is greatly blessed with various natural resources, the chief of which is the crude oil which has consistently catered for the survival of the country's economy. In the light of this reality, it should be expected that Nigeria should do way better than South Africa in the areas of socioeconomic growth and development, but the reverse is the case. Also, the population size of Nigerians that are educated, industrious, and committed to diligence and hard work is expected to produce a bank of intelligence and man power that will multiply the possibilities of the country, but unfortunately poor administration and governance have limited the usefulness of these potentials.

4. **Mass Violence Management**
   The mode of violence management in Nigeria and South Africa contrasts greatly; to a large extent, mass violence or rioting is often not domicile in Nigeria. This appears to be a good feat, but a deeper examination would reveal a bitter truth. The ongoing Boko Haram insurgency has proved to be an exception and a destabilizing force. Also, it is not the case that Nigerian citizens are comfortable with the status quo, but the victimization of innocent citizens who go about their normal live is responsible for their refrain from mass violence as law enforcement agencies and politicians with thugs regularly victimize, molest, and extort citizens. South Africans on the other hand seem to have the liberty of actions to such an extent as of initiating and implementing notorious and obnoxious xenophobic attacks with the government seemingly unable to act. All these are some of the differences in the administration and governance in Nigeria and South Africa.

## Conclusion and Recommendation

It is no gainsaying that the benefits accruable from engaging in comparisons or a comparative analysis between states cannot be overemphasized. Comparisons have proven to present to us a need to check and recheck the progress of states and nations especially in Africa. The comparison of the two largest economies in Africa as presented in this paper clearly unveils the deplorable state of governance and public administration in Africa. The tragedy of the paradox "so rich, yet so poor" is evident in these two countries, and without doubt or controversy, the deplorable state of governance in these countries is not unconnected to the bad governance and ineffective public administration.

It is therefore recommended that citizens should be involved in governance by participating in decision-making processes and in politics and in challenging the anomalies suffocating good governance and effective public administration within the confines of the law. It is also recommended that political and administrative bureaucrats and elected officials should assume more responsibility and be accountable while recognizing that the primary purpose of their occupation of public offices is for the advantages of the masses and not for illegal accumulation of public fund resulting in state capture. They are also expected to formulate sound policies and review the same if need be, especially the public good and public services in pursuit of effective deliveries of basic social and administrative services to their citizens.

Civil service; Public administration; Public management; Uganda

## Definitions

Public administration is defined in this entry as all the processes, organizations, and individuals associated with implementation of public policies, laws, and rules issued by their government using specialized knowledge, technical skills, and aims at translating goals into concrete accomplishments (see Tansu 2016). The term public management is used in this entry to refer to a process of deploying human financial assets and other public resources so as to achieve setout objectives and measured results.

## Introduction

Public administration and in more recent years public management are some of the most important engines that determine the functioning of a country. If any society or country gets if public administration/management infrastructure wrong, then it may not get its development objectives correct. Experience has also shown that in most of the progressive societies, public administration through a proper recruitment, deployment, retention, reward of public servants, and proper utilization of public resources has been central to their success. Through its entire history as a country, Uganda has tried to have an effective public administration with a lot of difficulty. This entry uses a historical approach to discuss Uganda's public administration/management experience. Some of the mistakes are deliberate with intention to exploit, and others are outcomes of trial and error experiments that the country has endured of the course of its difficult history.

## Origins of Public Administration

Public administration as a practice is as old as human civilization itself. However its growth as an academic field of study started with President of the United States Professor Woodrow Wilson who argued in his 1887 seminal article *The Study of Administration* that it is difficult to run modern complex governments without thorough knowledge of public administration. Other early Western scholars including Francis W. Taylor, Max Weber, Luther Gulick, Herbert Simon, and James Buchanan built on Wilson's work and developed managerial, political, and legal approaches that tried to theorize how public administration can be organized. The managerial approach was historically established as a remedy to the political patronage appointments of the civil servants that resulted in inefficiencies and

corruption. Its main tenets were that for government to be effective in serving the public good, it should be run in a business-like manner where efficiency, performance, and economy as the intended desirable outcomes emphasize separation of politics and administration, with administrators in charge bureaucracies and not politicians. The approach also discourages selection of administrators based on political affiliation, race, or sex, and instead emphasis is put on the ability to perform, division of labor, specialization, hierarchy, and written down rules all of which fit into a rationalized approach of doing work (see Woodrow 1887; Gulick and Urwick 1937; Shafritz et al. 2011). On the other hand, the political approach to public administration emphasizes the values of representativeness, political responsiveness, and accountability through elected officials to the citizenry (Rosenbloom 1989). The legal approach to public administration views each individual as a unique person having his/her own set of circumstances, unique thinking, motivation, and values, and thus adversary procedures are designed such that individuals are able to explain their circumstances before decisions are made. The legal approach looks at public administration from the administrative, judicial, and constitutional law perspectives. Administrative law emphasizes laws that lay the foundation on how organizations are run, determines the competence of the authorities which execute the law, and indicates to the individual remedies for the violation of his rights. On the other hand, judicialization calls for establishment of procedures to protect individual rights and fairness when mediating conflicts between private parties and the government, equity, and equal protection by the laws. The constitutional law approach to public administration safeguards rights of individuals in two ways: first, the immunity of public servants from civil suits for damages is reduced to qualified immunity, and secondly, courts frequently decree ongoing relief requiring institutional reforms that place the judges in the role of "partner" with public administration (Goodnow 1905). This kind of public administration is not what existed in African communities before colonialism, and it is not what colonial administrative systems establish in Africa generally or Uganda in particular.

## Colonial Public Administration in Uganda

Different ethnic communities (over 30) in pre-colonial territories that constitute Uganda today had their systems of administrations ranging from small polities that hardly existed beyond a village in non-stratified communities such as Samia-Bagwe where the Nalundiho was a little more than a village head to highly centralized kingdoms of Buganda, Bunyoro, Nkore, and Tooro, which had absolute monarchs that ruled over their areas with the help of chiefs. The main objectives of colonialists were to serve their home countries interests especially commercial. Very early on, the British decided that they would not make Uganda a settler colony but would exploit the resources of the country especially agricultural production using Ugandan peasant production. In administrative terms, indirect rule mostly relying on local Baganda chiefs and others who were also ready to pay loyalty was instituted. Thus the most important criteria to become a chief or assume any colonial office were loyalty. The chiefs were only accountable to the colonialists and instituted decentralized despotism of their own when each chief assumed all powers of a judge, administrator, and lawmaker. The 1919 Native Authority Ordinance gave the district commissioner (white colonial agents) powers to appoint chiefs at village, parish, subcounty, and county levels. Councils, originally consisting of these chiefs, were created during the 1930s at each level. The Local Government Ordinance of 1949 established ethnically oriented district in non-kingdom areas as separate administrations. During the 1950s, elections to district councils were introduced, and the councils were given responsibility for district administration. This meant that district councils were tribal councils concerned only with matters affecting their respective communities, for instance, the district council say of Kasese hardly knew and cared about the problems of Bukedi District.

Nevertheless, the central government retained the power to control most district council decisions. Any native who tried to oppose or question the chiefs or district commissioner's powers or way of doing things was crushed, imprisoned, or exiled. Ethnicity, religion (in favor of protestants), and colonial loyalty defined the parameters of both the native authorities in charge of the local state apparatus. It was this kind of predatory, unaccountable, oppressive, ethnic, and hated administrative structure that the Uganda government inherited at independence.

## Postcolonial Public Administration

The 1962 Independence Constitution maintained the same colonial administrative structure also stayed until 1966 when Prime Minister Obote abolished kingdoms after his showdown with the Kabaka of Buganda and the public service that was supposed to serve Ugandans inherited the same predatory culture of serving narrow as a basis for their survival. The 1967 Constitution centralized all powers and subdivided the abolished kingdoms into districts that had the same relationship with the central government as other districts in the country. To concretize the constitutional changes, the Local Administration Act 1967 that made the district councils mere agents of the central government was passed. Their budgets and development plans had to be approved by the central government. The Obote government was also moving toward the socialist left, and thus the government was involved in so many administration and economic planning functions. When Amin came to power in 1971, he suspended the constitution, abolished parliament, dissolved district councils, and proceeded to rule by decree. In 1973, local administration was reorganized into ten provinces headed by governors drawn from the army and appointed by the president himself. People who had undergone military training headed counties, subcounties, parishes, and sub-parishes, while districts were headed by district commissioners largely drawn from traditional civil service. Questioning of orders given by government was not allowed, and people were not appointed on merit but on the basis of loyalty to government. Very quickly, Amin's regime turned everything upside down, and total collapse followed in all direction including public administration, political instability, civil strife, and economic decay. The second Obote government ruled from 1980 to 1985, and all it did was just to reorganize the local government structure in accordance to the 1967 Constitution and the 1967 Local Government Administration Act which was a highly centralized administration, and patronage was a common practice.

## Public Administration and Management Museveni Rule

President came to power in 1986 and inherited a failed state, ruined economy and with no organized public service to talk about but a demotivated, highly corrupt, and inefficient civil service (Andrews and Bategeka 2013). Meanwhile as Museveni and his NRA rebel fighters were trying to thread several pieces to resuscitate a broken public administration, many changes across the globe were also changing the thinking on how public administration should be conducted, and it caught up with Uganda. During the early 1980s, high inflation; unemployment; oil shocks; militant labor unions; huge state-sponsored welfare programs; and long-standing criticism of the poor quality, unaccountable, inflexibility, hierarchical, and inefficiency of public services forced governments in developed countries to move from traditional public administration to public sector management which closely follows on the tenets New Public Management (NPM) that also aimed to model the way governments work on private sector methods of management that were assumed to be superior to those of the public administration (Ridley 1996). NPM emphasized hands-on professional skills, explicit standards, and measures of performance through clarification of goals, targets, and indicators of success; shift from the use of input controls and bureaucratic procedures to rules relying on output controls measured by quantitative

performance indicators; shift from unified management systems to desegregation or decentralization of units in the public sector; introduction of greater competition in the public sector so as to lower costs and achievement of higher standards through term contracts; stress on private-sector-style management practices, such as the use of short-term labor contracts, the development of corporate plans, performance agreements, and mission statements; stress on cost-cutting, efficiency, parsimony in resource use, and doing more with less; and introduction of market and quasi-market mechanisms, customer-oriented services minimal government, contracting out, privatization, and performance management (Aucoin 1990; Hood 1991). President Museveni and his government walked into this global public administration reform storm and which in fact served their political objectives perfectly. Under the World Bank and IMF structural adjustment policies conditionality, Uganda undertook public administration reforms that included retrenchment of civil servants, restructuring and scrapping government ministries, and department and public enterprises among others. While the international reformists thought that this public administration paradigm shift would take Uganda's public service back on course, it also presented the new Museveni government an opportunity to purge out all the old guard civil servants that served the governments he had just defeated in a war and replaced them with new NRM supporters.

## Recruitment into the Public Service

For many years after that, efforts by the international community to assist Uganda to establish a Weberian kind of public service in which meritocracy is a prime factor during recruitment, promotion, and availability of predictable long-term careers have yielded very minimal successes. In most instances, appointments in Uganda are now based on a candidate's political capital. Where there is appointment on merit, especially in very complicated deployments, the most competent cadres are assigned to those ministries that are central to the survival of government. Otherwise, less strategic ministries, such as that of public service, receive non-vibrant leaders who are usually appointed from the outer circle elites on the basis of their loyalty and ability to bring in a network of clients for the ruling party. President Museveni and his government enjoy and have built a highly politicized public service system in which government officers are deployed to serve the interests of the ruling party. The Constitution of Uganda allows the President to participate in the selection of civil servants, and over the years, this has allowed him to meddle in the affairs of the civil service, thereby taking responsibility away from independent bureaucrats – especially from the judiciary, local governments, and recently the police. Under the decentralization system, the recruitment and appointment of local government technocrats, especially chief administrative officers (CAOs), were also decentralized. The CAOs also act as the chief returning officers in districts during elections. Starting in 2001, Museveni begun to lose elections in some districts mainly because many CAOs were not directly appointed by the central government and thus could act independently while announcing election results. President Museveni accused them of conniving with the opposition parties to deny his party victory, and in 2007 the government decided to recentralize the appointment of senior local government bureaucrats such as CAOs, deputy CAOs, and town clerks. Using this chance in the law, the President has been able to recruit and deploy regime-compliant officers from district level to central government and semiautonomous agencies. Several staunch supporters of the NRM have been appointed as judicial officers, which has brought this arm of government under Museveni's effective control. The politicization of the civil service usually heightens during the buildup to presidential elections, for example, toward the 2016 elections, the project to issue national identity cards was withdrawn from mainstream civil servants and handed over to military officers with an objective of keeping retired army officers preoccupied, thereby reducing the chances of them being co-opted by the opposition which almost happens across the board on many projects. The Museveni regime has also

substituted professionalism with ideology as exemplified in the several indoctrination exercises that take place at the National Leadership Institute in Kyankwanzi, where senior public servants, election workers, soldiers, intelligence officers, and other such persons who are expected to be neutral in the course of their work are obliged to attend political lessons and must graduate from. Meanwhile as all this hullaballoo has been taking root, more independent and specialized public institutes that used to provide induction and in-service training to public servants such as Uganda Management Institute (UMI) for training senior public servants were privatized or abandoned as methods to weaken or circumvent sections of the civil service whose allegiance cannot be counted upon in favor of those sectors that are led by trusted cadres (Bukenya and Muhumuza 2017).

## Creation of Multiply Authorities and Agencies

The government decided to create several agencies and independent authorities not just for duplication of roles to create a balance in Museveni's management strategy but mainly as a channel for funneling patronage resources. Most of the created authorities and agencies were a way of creating lucrative jobs and access to public resources to people carefully selected by the regime. This created a lot of stress on public resources, and the agencies that suffered most from this were the line ministries as more resources were shifted to these semiautonomous agencies. Most authorities had the independence to set their own salaries an opportunity these used to reward themselves handsomely, while people in line ministries and the public service are getting peanuts. This has resulted in several conflicts and laying down of working tools especially from university lecturers, medical workers, teachers, and prosecutors who see it as an injustice for them to be earning meager salaries when their counterparts and even less qualified people in semiautonomous government agencies are taking fancy salaries. With a lot of pressure from these groups and public outcry, the government has now announced that less efficient and non-income-generating government agencies that have duplicated roles have to be scrapped, merged, or made department in their line ministries. Most people in the country have welcomed this development and are now campaigning for a rationalized public pay system, a reduced parliament, reduced number of districts, effective fighting of corruption across government, and establishing a meritocratic recruitment system across the board that remain to be seen.

## Conclusion

Without doubt Uganda has endured a lot of difficulty, but also some progress has been registered. As the country aims to transform itself into a modern society, it must take deliberate steps to modernize its public administration and management practices. Otherwise having an impressive record of introducing well-documented public sector reform proposals and laws on paper cannot be of significant help to the citizens. Overstaying in power and designing public administration structures with the intention of consolidating a regime in power are some of the key issues that have to be addressed in order to avoid future problems.

# Public Administration and Religious Leaders in Nigeria

Robert Dibie
Department of Public Administration and Health Management, Indiana University Kokomo, Kokomo, IN, USA

## Synonyms

Administrative reform; Betrayal of public trust; Faith-based religious institution, nation building; Moral leaders; Personal kingdom building; Religious injunction

## Introduction

The current challenges facing the political system in Nigeria require reliable and ethical leaders than other times in the nation's history. Faith-based leaders just like their political counterparts have become one of the major problems facing the development process in the country (Ake 2005; Diamond and Plattner 2010; Edoho and Dibie 2017). In the past, faith-based institutions in Nigeria were highly trusted; however, corrupt religious leaders do not seem to have the moral solutions to their problems anymore (Iheanacho and Kilani 2016; Obadare 2018). Rather than preaching about hard work, the focus of most faith-based institutions' leaders has been that of tithes, sowing seeds to get instant blessings, miracles, and wonderful progress in life (Zook 2017).

In addition, government leaders in Nigeria, be they ministers, public administrators, members of national legislature, or senior army officers, are known to misappropriate most of the nation's public funds for personal use (Iheanacho and Kilani 2016; Obadare 2018; Okoro 2012). According to Dibie et al. (2018), a more troubling aspect of these corrupt practices is that the stolen funds by government and faith-based leaders are never invested in Nigeria's economy rather they are expropriated to western industrial countries.

Since the 1980s Muslim fundamentalist group called Maitatsine and Boko Haram planned and executed many brutal operations that led to the death of many non-Muslims members in the northern states of the country (Erisksen 2000; Soriola 2018). The Boko Haram militia group assumed that western education has been corrupting Muslim in the country (Agbiboa 2013; Kilani and Iheancho 2016; Zenn 2020). Ogbu (2012) and Iheanacho and Kolo (2016) contend that Boko Haram insurgency in Nigeria has led to the adoption of secondary school girls for many years as well as the killing to many innocent Nigerian citizens.

Further, in the past 6 years, Fulani herdsmen with guns that are Muslim often wonder into the farms of hard-working farmers in the Middle Belt

and southern states of Nigeria (Soriola 2018; Umana 2019). These herdsmen allow their herds to eat up the crops of these hard-working farmers in the mist of high unemployment rate in the country. These malicious behaviors of the herdsmen often resulted in violent confrontation (Fasan 2019; Soriola 2018; Umana 2019).

According to the Global Terrorism Index Fulani herdsmen has killed more than 2,000 innocent farmers in Southern Nigerian with their AK7 guns (cited in Umana 2019; Fasan 2019). The current President of the Federal Government of Nigeria Mohammadu Buhari, who is a Fulani, has not been able to effectively address these major security problems. Rather he has been accused of playing ethnic, religious, and political games with the life of innocent Nigerians (Agekameh 2012; Fasan 2019; Nnanna 2017).

President Buhari has also been accused of nepotism and tribalism due to the way he has appointed the Independent National Electoral Commission (INEC) Chairman, all the Army Chiefs, the Inspector- General of Police, Custom and Excise Controller, the Chief Justice of Nigeria, and other Security Agencies chiefs in the country (Nnanna 2017; Obadare 2018; Ojo 2019). It is not a coincident that the above appointed senior officials in President Buhari's administration are all either Fulani, Muslims, or both just like him (Etakibuebu 2016; Nnanna 2017; Ojo 2019).

There is a major gap in the literature about Nigeria's faith-based institutions and political leadership. The goal of this chapter is to investigate the differences between faith-based and political leaders in Nigeria and close the gap.

## Conceptual Framework

Ethical leadership encompasses the embodiment of justice fairness, compassion, integrity, equity, equality, respect, and moral values that could enhance or foster solidarity and development for people in a country or government (Ferrell et al. 2019). According to DesJandin (2020), ethical leaders tend to consider the interests of all works or citizens as well as the needs of the poor and rich in a country.

The utilitarian benefits by Bentham, and Stuart Mill (cited in (Geuras and Garofalo 2011), postulate that compassion, and a sense of community would be ideal if everyone was compassionate, kind, and work for the good of community rather than for themselves (Hosmer 2010). This is the rule that is often summarized as "greatest good for the greatest number" (Hosmer 2010). One other principle of ethics propounded by Robert Nozick (cited in Hosmer 2010) is called the contributive liberty. The principles compel leaders and governments not to interfere with other people's self-development, as well as stay with the constraints of the law.

Figure 1 shows that promoting ethical leadership and moral professionalism entails applying the principles of (1) honesty and compassion; (2) not taking any action that could harm the poor and the uneducated or anyone; (3) leaders should not take any action that he/she will not be proud of; (4) leaders should take actions that would lead to the greatest good for the greatest number; (5) eliminate distrust between government and the citizens: and (6) leaders should not interfere in other people's self-development. Figure 1 shows the relationship between ethical leadership and the six universal principles of ethics.

The religious injunction principle by St. Augustine and St. Thomas Aquinas suggests that honesty, truthfulness, and temperance are not always enough. As a result, human beings need to express kindness and compassion toward each other in the form of reciprocity (Hosmer 2010; Ferrell et al. 2019). The personal virtue by Aristotle suggests that human beings should make all attempts to eliminate distrust by engaging honestly, openly, and truthfully with one another (Geuras and Garofalo 2011).

Distributive Justice ethics principle by John Rawls (2001) contends that justice is meant to be the first value of social institutions, just as truth is the first value of belief system. Rawls (2001) envisioned in his theory of *justice that fairness should entail* a society of free citizens holding equal basic rights within a political system. Socrates contends that there could be no happiness in the pursuit of pleasure by exploiting other people (Geuras and

Source: designed by Dibie, R. (2020)

**Public Administration and Religious Leaders in Nigeria, Fig. 1** Ethical leadership and the six universal principles of ethics (Source: designed by Dibie 2020)

Garofalo 2011). Therefore, there could be no happiness in the ownership of property unless you morally and ethical work honesty to attain it.

The review of literature suggests that the future of Nigeria will depend on equal access to capacity building and economic empowerment of all its citizens (Edoho and Dibie 2018). In addition, compassion that could result in the greatest good for the greatest number is what is expected leaders in Nigeria in the near future.

## Research Method

The purpose of this study is to investigate the differences between faith-based institutions and political leaders in Nigeria. The analysis utilized data derived through interviews and questionnaires research methods. A total of 26 out of the 36 states were researched in the country. Questionnaires were administered to 3,000 respondents that was randomly selected from 26 out of the 36 states in the country. Those who participated in completing the survey and interviews, respectively, included members of different religious affiliations, various staff the federal state and local governments, and many people employed in the private sector. A total of 2,225 (74%) questionnaire was completed and returned by the respondents. Data were analyzed with the use SPSS statistical tool and presented in correlations, tables, and percentage. A total of 400 in-depth one-on-one interviews were conducted in the same 26 states as well. The study was conducted between 2017 and 2019 in Nigeria.

Three major research questions were tested. The limitation of the study is that only 26 out of the 36 states in Nigeria were covered by this research. Many of the respondents cannot read

English properly. Current pastor and political leaders were not interviewed. The dependent variable is leadership, and the independent variables are ethical credibility, servant leadership, economic development, and tribalism and ethnicity.

## Analysis and Discussion

The demography of the respondents for this research include 2,225 members, 894 men, and 1,331 women. Below are the responses to the three research questions.

Research Question 1: Do you think your faith-based and political leaders in Nigeria are ethically credible?

The analysis of question 1 reveals that 62% of the reported that their faith-based and political leaders were not ethically credible. Further, 81% of the respondents also indicated that faith-based leaders are not ethically credible because they live the same ostentatious lifestyle as the corrupt political leaders. The analysis reveals that 83% of the respondents indicated that faith-based and political leaders are not accountable to the citizens or church or mosque members.

Ninety percent (90%) of the respondents stated that faith-based and political leaders always travel to Europe and North America with the money appropriated to provide public goods and services for the citizens. While 82.6% of the respondent reported that faith-based and political leaders believe in self-aggrandizement, another 78% of the respondents indicated that faith-based and political leaders are intoxicated with power. The mean of Table 1 data is agree 58.1 and disagree 41.7%, respectively.

The interview analysis shows that 92% of the interview respondents reported that faith-based and political leaders in Nigeria are not ethical credible. Only 8% indicated that not all the leaders are corrupt. In addition, 85.5% of the interview respondents stated that faith-based leaders do not have moral values to preach about integrity anymore because they continue to accept stolen money from political leaders. Below are some the statements made by some interview respondents:

> "Evangelical church pastors and Imam now travel with a fleet of luxurious cars and many security guards. They are no longer saving God or Allah; they are displaying power and wealth in the name of the Lord."

> "All we hear from these new generation Pentecostal pastors is sow a seed and pay your tithes to received God's blessing. They get the money and use it for their own benefit."

Another 76% of the respondents also indicated that some faith-based leaders no-longer care about moral values because they can have received blood money from political leaders and armed robbers. *Thus, faith-based and political leaders are not different in respect of their immoral and unethical values.*

Table 2 Analysis reveals a moderate positive relationship between lack of ethical credibility (0.067) and faith-based and political leaders. The data shows a strong positive relationship between lack of credibility and the ostentatious and luxurious lifestyles of faith-based and political leaders (0.170) in Nigeria. The data also reveals a strong positive (0.176) relationship in respect of corrupt faith-based and political leaders' lack of ethical credible because they always travel to abroad to spend taxpayers' money. There is a strong positive relationship between lack of ethical credibility of faith-based leaders and inadequate accountability (0.152) to the church or mosque members. The correlation matrix also reveals a strong positive relationship between lack of ethical credibility and faith-based and political leaders believe in self-aggrandizement (0.171). *The correlation analysis shows that there are no differences between the unethical behavior of both faith-based and political leaders in Nigeria.*

Research Question 2: Do you see any difference between your faith-based and political leaders' role as servant leaders?

Table 3 Analysis for question 2 reveals that 94.2% of the respondents indicated that faith-based and political leaders in Nigeria are not ethical leaders because there is no constant electricity for all citizens 7 days a week. On one hand, 86% of the questionnaire respondents stated that political leaders are corrupt like faith-based leaders. On the other hand, 81% the same group indicated that

agree 46.6% and disagree 59%. *The data analysis confirmed that the principles of ethical leadership are also not promoted by both faith-based and government institutions' leaders in Nigeria.*

Eighty-nine (89%) of the interview respondents indicated that ethical leader values are far from the operating style of both faith-based and political leaders in Nigeria. Unfortunately, faith-based and political leaders tend to be obnoxious. Further, 98% of the interviewed respondents stated that faith-based and political leaders have a similar desire for individualism and personal kingdom development rather than ethical leadership values. Below is some statement that was made by respondents:

> "Nigerian Leaders steal the citizens money and travel to America, England. Canada, Dubai, and Indian to receive good medical treatment while they deliberately poorly fund our hospitals and equipped them for the needs of the low-income citizens." Shame on Nigerian corrupt leaders"

> "There is nothing like ethical leaders in our country. Church and especially political leader see shared governance as a process of sharing stolen money between political cronies while the poor citizens continue to suffer."

Table 4 shows a strong relationship between faith-based and political leaders' lack of their ethical leadership roles due to corruption (0.172). Further, the data revealed that public administrators (0.161) are as corrupt just like faith-based leaders in the country. In respect of the provision of electricity for all citizens 7 days a week, there is also a strong positive correlation of (0.183) for lack of ethical leadership role. Moreover, government is not effectively providing public goods and services for all citizens' score a moderate positive (0.053) relationship with poor ethical leadership role. The problem of lack of good health system for all citizens in the country scored a strong positive relationship (0.093) with lack of ethical leadership role.

Research Question 3**:** Do you believe that tribalism and ethnicity has affected the role of faith-based and political leaders in Nigeria?

Table 5 Analysis for question 3 shows how tribalism and ethnicity has negatively affected the role of faith-based and political leaders in Nigeria. The data shows that 82.7**%** of the questionnaire respondents indicated that the President has not taken drastic measures to address Boko Haram insurgency in the country probably due to tribalism, or religious affiliation. A more troubling observation made by the respondents (72.2%) indicated that the President of the country has been silent about the Fulani herdsmen's brutal activities in Nigeria due to tribalism.

Sixty-five percent (65%) of the respondents reported that the Federal Government of Nigeria is not doing its best to stop kidnapping in Nigeria because the President is from a tribe in the northern states of the country. In addition, 67% of the

respondents revealed that nepotism and tribalism are major problems in the country. Seventy-one (71%) of the respondents reported that one tribal group dominate the key positions of the Federal Government of Nigeria. Another 65% of the respondents stated that the government now mostly employs citizens on the basis of tribalism or religion instead of qualification and experience. The mean of Table 5 data is agree 54.9% and disagree 44.4%, respectively.

The interview data shows that 97% of the respondents indicated that tribalism and ethnicity has affected the role of political leaders. In addition, 56% reported that tribalism and ethnicity may have affected faith-based leaders' role. Furthermore, 93% of the interview respondents indicated that in their respective faith-based leaders often associated with group members that are either selected based on ethnicity or wealth.

In addition, 61% of the interview respondents stated that since the government of Nigerian returned to representative demonocracy in May 1999, civil servants are not paid for several months, retired people have not received their pension for over 2 years, and the incident of corruption has increased. The following statements were made by interview respondents:

> "I wonder why the 300,000 Nigerian army cannot defeat the Fulani herdsmen that have been brutally killing citizens from southern Nigerian. My God help Nigeria."

> "Tribalism and religion are superficial problems that created by selfish megachurch, Mosque for self-aggrandizement in Nigeria"

Table 6 reveals a strong positive relationship between tribalism (0.153) and the inability of the President, who is from the Fulani tribe not to take

**Public Administration and Religious Leaders in Nigeria, Table 6** Correlation matrix for tribalism and ethnicity

drastic measures to address Boko Haram insurgency. The correlation data also show a moderate positive relationship (0.075) between one tribal group dominating the key affairs of the Federal Government and tribalism or ethnicity. Government good and services are distributed around the country on the basis of tribalism also has a moderate positive relationship (0.058) with tribalism and ethnicity. Some respondents observed that while Brazil, South Korea, and Peru have all sent their previous presidents to jail for corruption, the Nigeria government and political leaders have ignored the role of law, social justice, and liberty for all.

## Public Policy Recommendations

The solutions to the challenges of unethical and corrupt activities among faith-based and political leaders in Nigeria constitute a serious need for reliable or effective legal and social justice programs in the country. Freedom, trust of government, and the rule of law are argued to be the soul for a nation's building and economic development (Edoho and Dibie 2017). Another method to combat the unethical issues of corruption and self-aggrandizement in Nigeria is using a combination of ethical training and Code of Ethics.

*Judicial Reform:* The Nigerian judiciary system should be overhaul so that nobody is above the law or the constitutional provisions of the country. *Corruption Solution*: In addition to enforcing drastic punishment for those that are found guilty of corruption, the citizens of Nigeria need to be able to speak up for their rights and demand accountability from their political and administrative leaders. *Capacity Building:* The Government of Nigeria must initiate measures that could help to create jobs for the citizens to meet their needs.

*Promoting Economic Growth*: Minimal government intervention in the private production of goods and services, few regulations of the industrial sector, and a shared governance approach to promote social and individual responsibilities could rejuvenate economic growth and development in the country (Mandel 2013; Mankiw 2018). *Strengthening Good Governance:* Good governance is also about accountabilities, which depend on information, transparency, and recourse contestability. *Term Limit*: One of the major predicaments in the democratic system in Nigeria is term limit and the re-circling of old politicians. *Auditing Church and Mosque Accounts:* In order to control the extravagant lifestyle of faith-based leaders in Nigeria, there is the need to frequently audit their earning every year.

Imam and Pastors found guilty of violating Inland Revenue laws should be sentence to prison. It is very important to punish those that are stealing from the poor to benefit themselves, their families, and cronies.

## Conclusion

In this chapter, I investigated the significant differences between faith-based and political leaders in Nigeria. The findings of this research revealed that there is no difference in the ostentatious lifestyle of faith-based and political leaders in Nigeria. The solution to these unethical challenges lies in the nation's ability to take drastic actions to enforce a new Code of Ethics, judicial reform, fight against corruption, capacity building, promoting economic growth, strengthening good governance, term limit, and auditing church and mosque accounts annually.

Finally, for faith-based and political leaders to effectively help all the citizens of Nigeria: (1) they must have compassion on them; (2) recognize what the people's needs are; (3) know what they have to offer; and (4) connect with the people at the point of their need. The role of ethical leaders should be to have compassion, be honesty, and serve as a servant or steward leader in such a way that economic development initiatives could benefit everyone. This principle should be the goal of a good life for everyone, ethical leaders, and the greatest good for the greatest number as well as transformational economic development, respectively.

# Public Administration as a Professional Practice

Md Nazirul Islam Sarker
School of Public Administration, Sichuan University, Chengdu, People's Republic of China

## Synonyms

Ethics; Liability; Professional responsibility; Responsibility in the workplace; Values

## Definition

Professionalism is one of the core values of public administration. In considering its essence and prestigious nature with vision and stewardship of public funds and information, it becomes a profession. There are three essential items to be a profession like knowledge, skill, and license. The public administrator possesses knowledge and skill but still lacks a license. The administrator cannot practice openly like another profession, for example, doctor, engineer, lawyer, etc.

## Introduction

The meaning of profession varies from sector to sector. It means an indicator of trust as well as expertise. It also means a group of people who possess a special kind of knowledge and skills in an extensively accepted body of knowledge derived from education, research, and training with recognition or license from a professional institution or recognized organization.

A profession is a group of people who are disciplined and adhere to ethical standards. This group is possessing special knowledge and skills in a widely accepted body of learning derived from research, education, and training at a high level and is recognized by the public as such. A profession is also established to apply this knowledge and exercise these skills in the interest of others (Evetts 2011).

A professional is an individual of a profession. Professionals are followed by codes of ethics and profess obligation to competence, honesty and morality, selflessness, and the promotion of public goods and services within their expert domain. Professionals are accountable to those served and to society (Cruess et al. 2004). Professionalism means the person has beliefs about the individual's own manner as a professional. It's often connected to the keeping of the principles, laws, and ethics of a profession as a mean of practice. Professionalization is the process of becoming a profession (Farazmand 2012). Greenwood (1957) reported that a profession should have few elements like an established body of knowledge, authority and credibility, certain regulation and control, code of ethics and a culture of values, norms, and symbols. On the other hand, Jones (2012) emphasized singular assumptions not

more than that. He argues that the main feature which differentiates it from other occupations is the position of legitimate control over work. Farazmand (2012) emphasized that public administration still suffers and will continue to suffer from a deficit of status and respect within and outside the university.

## Professional Practices of Public Administration

The professional practice of public administration is related to the activities of the executive, the legislature, or the judiciary. Many thinkers seem it is only related to the executive. But some others argue that public administration practices as the activities of organization and management financed from the taxpayer's money.

## Accountability

Accountability is the acknowledgment and assumption of responsibility for decisions, actions, products, and policies including the public, administration, governance, and implementation within the scope of the role or employment position with an obligation to report, explain, and interpret for output. In governance, accountability has expanded beyond the basic definition of being called to account for one's actions (Mulgan 2000). The accountability of public administration also means the government, civil servants, and politicians are accountable to the public and to legislative bodies such as a congress or a parliament.

In developed countries, the level of accountability practices is very high, and the parliament is strong and capable to punish anybody who is not accountable. Hughes (2003) argues that every government needs an accountability system, so that it acts in such ways which are largely approved by the community. For being democratic it is a key component for a society. So, the public administration is created by the public, for the public, and need to be accountable to the public.

## Transparency

The public administrator should be responsible for regulatory commitment with due diligence. It should have a set of clearly defined and publicly available operating procedures. The practice of transparency is highly adapted to developed countries, but it is very rarely effective in developing countries. Though developed countries have corruption, developing countries' corruption is worse than developed countries. Huque (1996) argues that public administration itself is liable to corruption since officials exercise a substantial amount of power. They are providing undue benefit to the people by interpreting or bending rules in favor of certain groups or individuals. A strong safeguard or transparency is necessary for deterring and dealing with corruption within administrative agencies. It has to develop ways and means to prevent and detect corruption in other sections of society. There is a possibility to loss the benefit of rapid economic growth or a stable political order due to a growing tide of corruption.

## Coordination of Works

The coordination of works among different departments is the key practice of a good administration. The result of any work will not be achieved properly due to less or no coordination among different stakeholders. It should be engaged and consulted with key stakeholders in the development of policy and strategy.

## Implementing Legislation

The legislation should be implemented in such a way that interprets it to facilitate changing public protection needs. It is widely practiced in developed countries but rarely used in developing countries. World Bank and the International Monetary Fund sometimes emphasize the structural adjustment of the administrative systems of developing countries which helps to develop a professional administrative system. Financial assistance from the international organization can help developing

countries to comply with all related issues of governments to make the administrative system as a professional organization (Haynes 1996).

## Advocacy

The advocacy of public administration is an activity to influence the decisions of political, economic, and social systems and institutions for the betterment of the public. It will promote professional issues for protection of the public. It is widely practiced in developed countries but rarely used in developing countries. Public administration should have a stronger advocacy role to earn public and private resources to maintain research and technical assistance which will develop administrators as professional (Rosenbaum 2014).

## Responsiveness

The public administrator should be consistent with related disciplines. It also maintains guidance, codes, standards, and expectation of the public. For getting a fruitful public administration, responsiveness is necessary.

## Competence and Conduct

The administrator should have the competence to do their assigned job properly. The public administrator should be maintaining a standard of performance. The administrators of developed countries are competent enough and conduct their jobs according to the policy taken by the government. On the contrary, the administrators of developing countries are not competent and negligent to their duties.

## Professional Bodies of License and Registration

The license is a mandatory item to be a profession. There is no professional body to give the license. In some cases there are some association of public administrators for discussing various issues and public affairs. Milakovich and Gordon (2007) reported that professional associations encourage lifelong learning of public administrators by training courses through offering annual training courses which allow administrators to work cooperatively with each other, to learn research results, and to apply them in their respective professional settings. Professional associations often offer other services to individual organizational members. These may include publications, technical assistance, brief notes, newsletters, updates rules and regulations, and other useful information to practitioners (Klingner 2000). Mexico is an example of professional practices of public administration where a well-developed network is available with national public administration centers and professional associations which are supported by government funding. Professional associations outside the United States can support these activities by showcasing Mexican public administration in their conferences, programs, and journals. But in developing countries, it is not available.

## Ethics and Bureaucratic Behavior

The ethics and bureaucratic behavior are essential professional characteristics to maintain the hierarchy and achieve organizational goals. Hughes (2003) argues that some problems occur in developed countries, particularly where bureaucracies having technical experts. A tradition of the bureaucracy is being quite firmly compliant to the political leadership using various sources of information, as well as formal and informal rules to ensure ethical behavior. The bureaucracy is superior to the rest of society in developing countries. The principles of examination led to a closed bureaucracy open only to elites, formally educated, often in the West, but operating at a remove from their society of origin (Hughes 2003).

## Law Implementation

The law implementation procedure is not the same in developed and developing countries. The rule of

law is commonly practiced in developed countries. But it is very rare in developing countries. The law implementation is based on the desire of political leader in most developing countries. The recruited official administrator is not able to exercise law due to political interruption (Garrison 2000).

## Professional Autonomy

There are some professional organizations available in developed countries. But these organizations are not like doctors' association, engineers' association, and bar association. So, these organizations can't certify any administrators (Evetts 2011). As a result, we can't compare the public administrator as a profession.

## Professional Service Status

The professional service status of the public administrator is not the same as other professional. Though, professionalism is one of the major values of public administrators but not like another profession who are paid. They are providing service to the public but can't claim money from them for delivering service. It is almost the same in developed and developing countries (Bellò and Spano 2015).

## Nonprofessional Occupation

There are so many public administrators who comes from non-public administration academic background but working as a public administrator. Some of them are a good administrator and some are not a good administrator. So, there is no demarcation in the recruitment system that differentiates professionals from nonprofessionals. The nonprofessional administrator is common in both developed and developing countries.

## Conclusion

It is the main fact that developing countries followed the traditional model of public administration during the colonial period and after independence. It is mentionable that most of the developing countries were under British colony. The main feature of the administration in developing countries is strict hierarchy norms and staff recruitment for lifetime career with good salary. On the contrary, the public administration practices in developed countries are more accountable, more transparent, corruption-free, and more interacted with a professional association. They are more devoted to their duties as a perfect professional. The reality is that public administration practices are very different in developed and developing countries. There are three essential items to be a profession like knowledge, skill, and license. Knowledge and skill are possessed by almost every public administrator which still lacks license irrespective of countries. The public administration is very much different from another profession like doctor, engineer, and lawyer. But the public administrator sees themselves a professional. It is good for a country. There are lacking some other criteria like professional autonomy, professional service status, license and registration, distinctive scientific theory, bounded-specific curriculum, specification of selecting administrator, membership of professional bodies, nonprofessional occupation, etc. irrespective of developed and developing countries.

# Public Administration as an Academic Discipline and Social Science

Md Nazirul Islam Sarker
School of Public Administration, Sichuan University, Chengdu, People's Republic of China

## Synonyms

Academic discipline; Learning; Public administration; Social science; Teaching

## Definition

Discipline actually focuses on the way of thinking or certain behaviors. Discipline also focuses specific way of creation of knowledge and organization of learning. Academic discipline is a way of thinking or a certain behavior, knowledge creation, learning, and teaching in an academic setting.

## Introduction

Public administration is a dynamic discipline. It is a set of processes, organizations, groups, society, as well as individuals associated with implementing laws and other rules administered by judiciary, legislatures, and executives (Pandey 2017). The concept of public administration has been gradually changed with time and made accordingly to the necessities of organizations, societies, as well as individuals. It also varies with the context of the country (Kim 2017). The model of administration of developed countries is not compatible with developing countries. So, it is necessary to develop an appropriate model according to countries' social, political, economic, and cultural context. The practice of public administration is prevailing in our society from the very beginning of the people's organized community life. Generally, public administration deals with administrative activities for implementing governmental policies with administrative requirements (Thornhill 2006).

In developing countries, public administration is suffering from a number of deficiencies like narrow orientation in understanding, bureaucratic failure, weak political commitment, corruption, lack of accountability and transparency, etc. The contribution of these deficiencies in public administration made failure to meet expectations of peoples of developing countries. That is why public administration as an academic discipline could not take the main place in social science. On the other hand, in developed countries, public administration has become the main force for society as well as government. It takes a prominent and influential place in developed countries' administration through setting processes, organizations,

and individuals with laws and rules administered by the legislature, executive, and judiciary. It also includes internal and external agency involvement for many rules and laws with the application. It also interacts with policies for ensuring good administrations in terms of people's value orientation accountability, transparency, etc. Developing countries have to adopt a strong political ideology, check and balances in every sector, appropriate institutional framework, sound rule of law, dynamic civil service system, proper accountability, and transparency.

Since public administration of developed countries largely depends on the staff of governmental institutions, so moral ground have higher importance for ensuring professionalism, competence, and effective management. The importance of public administration is increasing with time for ensuring sustainable government system irrespective of the country's context. The present trend of public administration largely depends on a clear appreciation of its surrounding social, political, economic, and cultural environment. Though, it is easier to say but difficult to do. The literature of public administration shows that one of the recurring themes has made it broad-based and free it from western-developed culture basis (Khan 2013).

The main emphasis in public administration research, practice, and teaching is on building, promoting, and integrating cross-country and cross-cultural studies (Khan and Islam 2014). Most of the developed countries like the USA, Canada, UK, Australia, China, India, Japan, and South Korea are increasing collaboration of public administration in teaching and research among scholars. The main goal of public administration in a global context is transcending division among cultures and national boundaries to build and test theories outside of the country in a specific context to address global issues of public administration (Dominique and Kealeboga 2014). The role of public administration as an academic discipline and social science is a continuous topic of debate and discussion. This chapter highlights the status of public administration as an academic discipline and social science in developed and developing countries.

## Public Administration as an Academic Discipline

The strong intellectual foundation is necessary to get an identity as an academic discipline (Farazmand 2012). Though public administration is the oldest profession but considered as a contemporary discipline due to a weak linkage between practices and intellectual foundation. The government of developing countries are facing the challenge of the twenty-first century regarding the creation of a system of governance that promotes competent interaction as well as ensuring the welfare, safety, health, and security of their citizens. It is necessary for the government of developing countries to strengthen their support to perform the functions which are required for ensuring socially equitable growth, enabling policies for promoting global economy and combating poverty. Khan (2013) suggested the several functions which will enable public administration of developing countries as an appropriate discipline such as promoting human resources; ensuring people's rights and political freedoms; assuring safety, security, health, and development; promoting social capital through activating civil society; conserving natural environment; utilizing financial resources; launching public-private partnership for service delivery, decentralization, and democratization of bureaucracy; developing physical and technological infrastructure; and encouraging private sector.

Public administration is like a machine which is composed of many components. If the components work well, the machinery of the government will work well. The issues of ethics and morality are a vital component of public administration. So, the framework of government should be ethically standard and corruption-free. Many articles reflect that public servants are violating the law regularly which reduces the trust of people. In developing countries, corruption spreads so endemic form by which people are bound to pay bribes to public servants both elected and appointed. Not only that appointed public servants are fallen in politics but also it degrades their morality to tend corruption for their political parties. So, there are income disparity,

uneven economic growth and resistant to administrative reform, etc. as common scenery in developing countries. Wolf (2000) suggested six trends to understand the government framework of the last two decades such as universal innovation, holistic mapping, flexible administration, information communication technology (ICT) networks, people participation, and human development. Though, all the trends are not compatible with the developing countries' administration.

Some developing countries adopted public administration as an academic discipline after colonial periods. For example, in Bangladesh, public administration is established as an academic discipline after 1960 by the effort of Professor Muzaffar Ahmed Chowdhury of Dhaka University who obtained a Ph.D. in Public Administration from the University of London. He took initiative to establish a Master of Public Administration at Dhaka University in 1968–1969. Then other five universities of Bangladesh introduced public administration at the bachelor and master level. Public administration in developing countries is an emerging discipline. It is still evolving and learning from the relevant environment. It is not only a discipline but also a profession which facing a number of challenges. If we fail to take remedial measure, the growth of public administration will be retarded by the upcoming challenges, especially in the developing countries. According to Farazmand (2012), the major challenges of public administration are predatory globalization, failure of the institution, scarcity in the field, and possibility of success to be an effective field of study. Emphasis should be given on the day-to-day challenges facing leaders and managers in the public and nonprofit service sector, such as dealing with complex and sensitive personnel issues. Budgetary and legal constraints are assuring ethical decision-making, maintaining a professional and respected workforce, delivering quality services, and ensuring high levels of measurable productivity in a government program.

Developed countries took an initiative to reinvent government, a movement that has gained considerable strength at all levels of government (Milakovich and Gordon 2009). This movement emphasizes the following points:

- A redefinition of the relationship between citizen and government
- Entrepreneurial thinking, innovation, and creativity
- Empowering public employees to enable them to do their best work
- Eliminating unnecessary regulation
- Achieving results with fewer resources
- Serving government's customers efficiently and well

The substantial changes in the ways of operation, government organization results from reinvention efforts, and it is visible at all levels of government. Emphasis should be given on ethics and integrity in both the selection of appointed and elected public officials. This concern has intensified in the public sector and includes a focus on various types of ethical considerations that enter into both political and administrative decisions as well as an examination of ways to promote more ethical behavior, responsive and accountability among public administrators. The growth of information technology should be adopted to enhance knowledge, improve access, and facilitate communication between citizens, elected officials, and public administrators. The information technology supports to give an opportunity for citizens to participate responsibly in public decision-making like the Internet, the World Wide Web, and teleconferencing. It can be applied worldwide to achieve greater access to decision-makers, improve efficiency in government, and influence the outcome of public issues. Stoffregen et al. (2016) emphasized using open-source e-learning technology on a means of learning for an open educational resource of public administration.

Though public administration is now an academic field of study, it is also far from a settled discipline (Box 2015). The boundaries between it and other fields are blurred, and there are many loose ends in terms of what of study and how? It has a history of conflict with its parent discipline (political science), and growing controversy

exists over just where public administration belongs intellectually and institutionally. The main issues are maintaining the ethics and accountability of public administrators within the context of the larger political system, increasing the internal efficiency and economy of public resources, and improving effectiveness or results of public programs. The issues depend on three levels of analysis such as the role and function of government bureaucracy in society at large, management of the public organization, and the role of individuals.

Public administration is now becoming a prominent and influential force in the government system of developed countries and society. It is a simultaneous and academic field of study as well as an active field of training. Current political issues and bureaucracy are related to administrative agencies. Public administration act as a set of process, organizations, and individuals related to the implementation of rules and regulations endorsed by legislatures, executives and judiciary with involving administrative agency (Milakovich and Gordon 2009).

So, it involves internal and external agency structures. It is also characterized by managerial components which focus on internal dynamics like training of administrators, IT operation, skills of personnel, and budgeting. At the national level, the developed country's public administration is maintained by a few public agencies. These agencies are organized based on functions, geographical areas, clientele saved, or work process. Administrators are classified based on hired through merit procedures or political appointment and specialist or generalists. In some of the cases, the state government follows the national governments. But the exception is not uncommon; some state government activities are influenced by local political parties and employees union at the state government. Obviously, the technical government is lower than the national government.

In developed countries, there are some similarities and differences in private and public administrators. The public administrator must pursue broad goals set by others and evaluated by outside agencies, but it is not true for private management. Public managers can't design their own organizational structures but it's almost opposite in private management. But both of the organizations have similar competent, effective, and efficient administrators. According to Milakovich and Gordon (2009), the public administrator has been shaped by several major and partially overlapping schools of thought such as politics-administration dichotomy, the chase of economy and efficiency of the main goals of public administration, principles of administration, rejection of the principals' approach, a turning toward different perspectives of administrative behavior, growing ferment regarding the links between public administration and its parent discipline political science, and developing trends that seem to carry the study. The study of administration is far from political science as well as allied disciplines of administrative study and toward disciplinary autonomy. Public administration may face new challenges regarding its knowledge exploitation for providing better service to people, for example, technological integration to its practices.

## Public Administration as a Social Science

Public administration is a social science which deals with the behavior of people in organization and society. It also encompasses other social sciences like political science, sociology, economics, history, psychology, and law. Box (2015) suggested six areas of actions for developing countries' administrator who want to be an agent of social change with a small act of sweeping within an environment. According to Box (2015) the public administrators should gather and analyze the information about six areas of social actions like the current situation to organizational goal, and wider aspect of knowledge and practices, alternative futures, and pattern of social and environmental change, adjusting operating system within the organization to serve social equity goal and recommending for positive change for offering information to citizen, meaningful access and protecting private lives and striving the equity and personal freedom (Zalmanovitch 2014).

The public administration of developing countries focused more on management, efficiency, mid-level managers, generic approaches, organizations and management rather than social values, equity, elites, specifically public issues, processes and institutions, and political science or sociology respectively (Rosenbaum 2014). In this era of governance, ethics and morality issues are continued to remain relevant for public administration. Governance framework of developing countries has been supportive of ethical and corruption-free public service and administration. Surveys after surveys globally showed the real picture of how public life has been suffered regularly through violation of gross acts and public trust by elected and appointed public servants. Corruption has become so endemic in many developing countries that have adversely affected all spheres of life. The consequences are there for all to see. People are compelled to pay bribes to public servants; all aspects of a career public servant's life are affected by partisan politics; income disparity between the beneficiaries of corruption and the majority of the population increases at a frightening rate; distribution of the benefits of economic growth, however marginal, goes mostly to the well-to-do segments of the society; and major reforms in administration are resisted and remain non-implemented.

## Social Change

Public administration adapted to rapid social changes by adapting to changing trends in political and economic thought. Now, public administration deals with rapid population growth and urbanization, increasing specialization, dealing with new social problems, and complex technological advances.

## Crisis of Legitimacy

Legitimacy is a political situation under which public officials are felt lacking in the legal authority to make decisions for the citizen. The several assumptions are required in the shaping of government such as the relationship of public programs to the social and economic betterment, minimizing the use of public funds, maintaining public programs at various level, decreasing less efficient public managers, and protecting abuse of payment and rewards of public managers. The legitimacy of the government may be easily declining due to the failure of the government and market institutional mechanism which reduces the trust of the citizen on institutional ability.

## Political Environment

The political environment is changed in developed countries due to an emphasis on both effectiveness and accountability of administrative agencies, reinventing government, customer service standards, employee empowerment, etc. The extent of recent presidential efforts changes the direction of government. Similarly, a gradual transformation of the public agencies is taking place at a global level due to the privatization of marketization and corporatization. This kind of transformation decreases the role of the public agency's bureaucratization.

## Field of Study

Milakovich and Gordon (2009) described the following points which made public administration as an academic field like social science in developed countries.

(a) Movement away from political science. It is the ancestral home of public administration. The emergence of public policy as a district and legitimate field of study has helped to bridge the methodological gap between two disciplines.
(b) Some schools of management and business administration have inaugurated distinct public sector management portions recognizing the growing importance of education in public sector-related subject matters.
(c) Schools, programs, and institutes of public administration have proliferated in the last

40 years with a number of distinctive features like it already separated from political science and developed as major social sciences.

Matei and Leoveanu (2014) mentioned that public administration is a complete science which deals with various social complex matters and explored the emergent behavior of people in an interconnected complex social system rather than an individual. In a society, people interact with each other, and their complex relationship was clearly explained by complexity theory. Adaptive management is necessary to solve the complex societal problem of developing countries. It is an approach which focuses on managers and policy-maker's action since they have to work under uncertainty and sometimes under wrong knowledge. It emphasizes knowledge acquired through management-based philosophy (Waldt 2014). Decision-making is one of the key factors for solving the problem. So, structured decision-making is necessary for adaptive management, and it engages stakeholders, experts, and decision-makers to determine resource management option (Farazmand 2012). It is necessary to emphasize governance for development. In some developing countries, structure decision-making governance is prevailing. Norms and values on accountability, collaboration, and decision-making should be ensured for doing better in the uncertain and unpredictable socio-ecological system (Matei and Leoveanu 2014). As an effective field of study, public administration must focus on the major dimensions like legal and constitutional dimension, organization and managerial dimension, political dimension, and intergovernmental dimension. These dimensions help to enhance the theory and practices of public administration.

Finally, there is an unsettled question in public administration. Considering the nature of the academic field and subject matter, one observer discussing the constitutional separation of powers and administrative theory has noted three separate approaches to public administration: a managerial approach most closely associated with the chief executive, a political approach geared to legislative concerns, and a legal approach associated with the judiciary.

## Conclusion

In developing countries, public administration could not bring desirable changes that ought to be as an academic discipline. But in some developed countries, it brought desirable changes in administration. As a social science, public administration covers all the fields like political science, sociology, social works, economics, history, psychology, law, and some issues related to business administration, environmental science, and disaster management. Public administration of developing countries is affected by many deficiencies which retard the country from sustainable development. On the other hand, public administration has become the main force for society as well as government in developed countries. It takes a prominent and influential place in developed countries' administration through setting processes, organizations, and citizens with rules and regulations administered by the legislature, executive, and judiciary. It also includes internal and external agency involvement for many rules and laws with the application. It also interacts with policies for ensuring good administrations in terms of people's value orientation, accountability, transparency, etc. A strong political ideology, checks, and balances in every sector, appropriate institutional framework, sound rule of law, dynamic civil service system, proper accountability, and transparency are required for developing public administration as an academic discipline in developing countries. The moral factors have higher importance for ensuring professionalism, competence, and effective management for public administration of developed countries since it is largely dependent on the staff of governmental institutions.

# Public Administration During the Indenture System

Suwastika Naidu, Anand Chand, Maureen Karan, Atishwar Pandaram and Jone Lako
School of Management and Public Administration, Faculty of Business and Economics, University of the South Pacific, Suva, Fiji Islands

## Synonyms

Indenture system; Indian laborers; Public administration; Taylorism

## Definitions

Indentured system: refers to the start of a new form of global labor mobility that involved taking laborers from India to a number of British colonies to work in the sugarcane plantations (Lal 2012).

## Introduction

The Indian indenture system has been undoubtedly the most discussed and debated topic in the existing literature by academics and practitioners. According to Lal (2012), the Indian indenture system started a new form of global labor mobility that involved taking laborers from India to a number of British colonies to work on the sugarcane plantations. During this movement of laborers from India, the specific British colonies that extensively benefited were Mauritius, British Guiana, South Africa, Trinidad, Fiji, Jamaica,

Suriname, Reunion Island, Grenada, St Lucia, St Kitts, St Vincent, Seychelles, Malaysia, Guadeloupe, Martinique, Belize, and French Guiana (Lal 2012).

A number of reports and studies, most of which form part of gray literature, have been published on the indenture system in different British colonies over the world, and most of these studies focused on the history, working conditions, and exploitation of workers. However, to date, none of the existing studies have examined how Taylorism and Weberian theories were practiced by the British rule and the Colonial Sugar Refinery Company in order to achieve their goal of establishing a fully functional economic system in Fiji. The main aim of this entry essay is to examine how the British traditional public administration system assisted the Australian-owned Colonial Sugar Refining Company (CSR) and the European planters to exploit workers in the sugarcane plantations. This entry essay provides a discussion on the early public administration models followed by a discussion on how these models are relevant to the indenture system practiced in the Fiji Islands.

## Early Public Administration (EPA) Model

The origins of public administration as theory and practice can be traced back to the early Iranian Susa Empire (3000 BC), then to the powerful Federated Elamite Empire of early Iran (3000–600 BC), and to the mighty One World State Achaemenid of the Persian Empire (559–230 BC) (Ghirshman 1954; Frye 1984; Farazmand 1996; Farazmand 2009). The Persian Empire was the largest, most professionalized, efficient, and most effective system of administration based largely on merit and covered around 80% of the world's populations spreading from Asia to the Middle East and Africa to Europe (Ghirshman 1954; Frye 1984; Farazmand 1996; Farazmand 2009). The Persian Empire was a major contributor to many administrative innovations and contributed to the development of "modern public administration, policy, organization theory and behavior, crisis and emergency management systems, communications systems, and financial management system" (Farazmand 1996; Farazmand 2009). Farazmand (1996) argues that public administration is as old as human civilization, and there are twin fields of public administration, namely, "development administration" and "comparative administration." Farazmand (1996) further mentioned that public administration as a field of study had gained more attention since World War II and during the 1960s under Fred Rigg's leadership of the Ford Foundation in the USA.

During the eighteenth century, the "early public administration" model (EPA) was used to manage the public sector, especially when monarchies controlled the public sector (Adams 1992; Frederickson 2010). This EPA model was based largely on "loyalty" toward those who hold power in society, for instance, loyalty toward a particular king and those people in power (Adams 1992; Frederickson 2010). The recruitment of government officials was not based on "merit" but family relationships (nepotism), favoritism, and bribery (Grindle 2004). In other words, it was predominantly based on family and personal aspects, and these resulted in corruption, lack of transparency, and the absence of accountability in the public service (Grindle 2004). Thus, the recruitment and selection under the early public administrative practice were based mainly on nepotism, and there were no formal procedures in place to ensure that those who were employed in the public service were competent enough to take up appropriate positions (Lavigna and Hays 2004). Besides, some of the practices, such as nepotism, making the public sector more personal in nature and patronage, may seem bizarre in the contemporary period but were acceptable practices under the early public administration (Hopkins 1974; Hughes 2012). Furthermore, the administrative positions during the early period of administration were not usually full-time positions but were part-time positions in nature. Some business people preferred to undertake part-time government jobs to maximize their business returns (Hall 1993; Skocpol 1995).

## Traditional Model of Public Administration (TMPA)

Over time, the monarchies changed into early forms of government, and by the early 1800s, the public sector began to adopt Weber's Theory of Bureaucracy. This led to the development of the "traditional model of public administration" (TMPA) (Karl and Sutton 1998; Hood 1991; Wart 2003; O'Flynn 2007). Two important theories that form the basis of the TMPA are Max Weber's Theory of Bureaucracy and Frederick Taylor's Scientific Management principles.

## Weber's Theory of Bureaucracy

In the eighteenth century, Max Weber developed his Theory of Bureaucracy (Weber 1922) that argued that the recruitment of government officials should not be based on family relationships (nepotism), favoritism, and bribery but instead on "merit" and "rational rules" (Chand 2018). Weber's Theory of Bureaucracy is based on five principles. Firstly, the management of the public sector should be based on written documents. Secondly, the management of public sector offices should be done in a specialized manner. Thirdly, the appointed officials should work in full capacity to meet the demands of the state. Fourthly, general rules must be followed in the management of the office. Fifthly, the administrative regulations would govern the principles of the fixed and official jurisdictional areas (Grindle 2004). Some of the key principles of the traditional model of public administration were undertaking a proper examination before appointing key personnel in the public sector and separating policy-making from public administration (Peters and Pierre 1998; King et al. 1998).

## Taylor's Scientific Management

Furthermore, Taylorism involved standardizing work practices, which implies finding the best way to work (Bain et al. 2002; Baldry et al. 1998). Scientific management emphasized three main issues (Jürgens et al. 1993; Niepcel and Molleman 1998). These three issues are time-motion studies, wage incentive system, and functional organization. Initially, Taylor's principles were applied to the private sector, and it was not long before Taylor's principles were applied to the public sector. Taylor believed that scientific management might be very useful in the public sector organizations because he perceived that each public sector employee performed around one-third or a half of a fair day's work. According to Schachter (1989), scientific management became a key theory that played an indispensable and vital role in both the private and public sectors.

## British Public Administration

The traditional model of public administration emerged in the nineteenth century from Britain (Peters and Pierre 1998; King et al. 1998). The British colonial government also allowed the European planters to utilize Taylorism in the sugarcane plantations. There are two reasons for using the traditional model of public administration, together with the Weberian Theory of Bureaucracy and Taylorism in this entry essay. First, the traditional model of public administration was used to correct the inefficiencies in the early days of public administration. These inefficiencies refer to the appointing of the public sector officials based on nepotism and lack of transparency and accountability. Second, during the early days of the public administration, Weber's Theory of Bureaucracy and Taylorism were widely used to improve the efficiency and effectiveness of the inputs employed in an organization.

## Indenture System in Fiji

Fiji was ceded to Great Britain in 1874, and the first Indian indentured laborers were brought to Fiji in 1879 (Lal 2004). This new colony of Fiji was in dire need of economic development so that

it could sustain itself in the long run. Fiji's first governor-general, Sir Arthur Gordon, protected the Fijian laborers from commercial employment and believed that Fijians should continue to live in their traditional surroundings, protected from the outside world and controlled and managed by their tribal chiefs. It was Sir Gordon that invited the Australian-owned Colonial Sugar Refining Company (CSR) to establish the sugar industry in Fiji. The CSR started its operations in Fiji in 1882 and departed in 1973. The decision of Sir Gordon to use Indians to work in the sugar cane plantations in Fiji was based on the success that was achieved by using Indians to work in the sugarcane plantations in Trinidad and Mauritius, where he had previously served as a governor before his appointment in Fiji. The colonial administration controlled the indenture emigration. The indentured workers were required to work for 9 h during weekdays.

Additionally, on Saturdays, they worked for 5 h. Sunday and public holidays were treated as free days for workers. Males were paid one shilling per day, and women nine pennies per day. These laborers were allowed to return home at their own expense after 5 years or at the expense of the government after 10 years. There was a huge disparity between what was promised to them before they departed from India and what they experienced upon their arrival in Fiji (Lal 2004). The Indians chose to migrate under the *girmit* system, as they saw this as a way to evade the tyrannical times and to attain a better socioeconomic life in Fiji.

Nonetheless, this did not prove to be easy for the *girmitiyas* (Girmitiya's refers the Indians who came to work in Fiji under the indenture system.), as the terms of indenture were different on entry as compared to reality (Pandey 2011). There was a strict routine to be followed by workers for 5 years, that is, after having breakfast every day they would have to pick their tools and start engaging in plowing, weeding the fields, digging drains, feeding the horses, mulching the cows, cutting and transporting cane to the mills, and ensuring that the road and bridges and tramlines were kept in a serviceable condition. Initially, the laborers were overloaded with tasks, and they hardly received the minimum statutory wages. Those workers that were underpaid could not afford a proper diet, so they were quite unhealthy and were frequently away from work (Lal 2004).

The nature and amount of work that was to be done by laborers were decided by the Colonial Sugar Refining (CSR) Company. There were few initiatives to reduce the number of abuses that laborers encountered. During May 1886, one hundred and thirty immigrants protested against the "task" system, where workers were only paid if they finished the allocated tasks in a given period. As a result of this, the government responded to this behavior by passing an ordinance where laborers were penalized for inefficient labor and enacted regulations that made it clear that more than five laborers could not participate in the protest (Sohmer 1984).

Additionally, the working conditions deteriorated and even the Colonial Office protested that something had to be done or else the Indian government would disallow further recruitment of laborers. There was no action taken by the Indian government or the CSR. The Indian laborers had no supporters, and finally, in 1916, the indenture system was abolished. It is noteworthy that the suicide statistics during the indenture system in Fiji was nine times higher than in Madras, as life in labor lines in Fiji were referred to as "*narak*" (*Narak* is the Hindu term that refers to hell where sinners are given punishment after death.) (hell) (Gillion 1962 cited in Sohmer 1984).

There are a number of studies conducted on the indenture system in Fiji. However, most of these studies are on the socioeconomic and cultural effects of the indenture system in Fiji. None of the existing studies have explored the public administration system that existed during the indenture system in Fiji. Gupta (2015) highlighted that the term "*girimit*" points to the erosion of the caste system and shows the impact of forced migration on indentured workers. Pande (2010) argued that the indentured system represented the evils of slave trading, thus making the victims of the indenture system also the victims of racial discrimination and racism. Kaplan (2007) and Lal (2012) highlighted that the "Indo-Fijian" identity was created from the intermarriage of

the Indian indentured laborers, also known as the *girmitiyas*, that were brought to work in Fiji's sugarcane fields (Balakrishnan 2015; Lal 2012; Munro 2012: 687; Pande 2010: Kaplan 2007; Luangphinith 2006). This process also ended the traditional Indian caste system as the "indentured system" forcefully obligated *girmitiyas* of different castes to live, work, and eat together (Balakrishnan 2015).

## Indenture System and Psychological Contract Theory

The indentured system contributes to the literature on the Psychological Contract Theory. The process in which the *girmitiyas* were lured to the boat without their consciousness was considered inhumane. According to Handy (1999), the term "psychological contract" is usually an unstated agreement between two parties, the nature of which included expectations. The most appropriate of the three types of psychological contract is the "coercive psychological contract" where a party has agreed with their will. Since the *girmitiyas* were pushed out of India (Pande 2010; Saha 1970; Gillion 1962), and the fact remains that they were not aware of the intention of their capture or their preferences were not sought. Furthermore, the indentured system adds to the literature on the Scientific Management theory (SMT), where the indentured laborers were forced to work in the sugarcane field, an environment not of their choice. SMT states that in order for the workers to work hard, they must be forced to produce the maximum output, which on the contrary, failed to consider their physical and their mental well-being (Ramasamy 2009).

## Indenture System and Human Relations School of Thought

Besides, the indentured system contributes to the Human Relations School of Thought theory. Since the *girmitiyas* were human beings, which, according to Maslow had human needs (Schmerhorn et al. 2013). The fact that they were pushed out of India and worked in sugarcane fields against their will and without any family relations made them fill the gap through intermarriage among themselves, which Gupta (2015) argued as the process of depleting the "caste system" in order to fulfill their social needs on the sense of belonging (Schmerhorn et al. 2013).

## Indenture System and Dunlop's System Theory

Also, the *girmit* era adds to the Dunlop's system Theory, where *girmitiyas* were part of the input as human resources in the sugar production process in Fiji. One can argue that the indentured system was the solution to labor woos in Fiji and other British colonies. They became one of the most important actors (Muller-Jentsch 2004) in the sugar industry in all British colonies that used the indentured system. According to Narsey (1979), around 60,000 indentured workers were imported from India to work in the sugarcane plantations in the Fiji Islands. Narsey notes that the workers were forced to meet task outputs, and workers who did not meet the task outputs were fined and made to work without any form of compensation until the work was completed.

Sharma and Lawrence (2009) and Gaines (2012) argue that initially, the Indian laborers were imported to work in the sugar cane plantations, but as the economy of Fiji evolved, there was an immediate need for the Indian workers to join the public sector and the government departments. The history proves that the Indians have played a significant role in establishing the economic system of Fiji. Work practices of indentured workers confirm that anything is possible with the right attitude and professional work ethics.

## Task System

Sharma and Irvine (2016) emphasizes that under the indenture system, the Indian laborers were controlled by using the task system. The task system involves the use of controlled hierarchy by using premeditated labor management practices in the

sugarcane plantations. Premeditated labor management practices used during the indentured system were such that it increased the pressure on the performance of the Indian indentured laborers. As a result of this, the suicide rate increased because some indentured laborers were not able to take the pressure that the CSR company had imposed on them. Chand (2007) emphasizes that the work ethics and discipline of the indentured laborers are significantly different from the work ethic and discipline of the new generation. The new generation of Indians in Fiji has socialized in a culture whereby they do maintain some of the aspects of the traditional Indian culture, but they have adopted western and local Fijian culture.

Davie (Davie 2000) allege that there was collusion between the British leaders and the high chiefs to import the Indian indentured laborers to work in the sugarcane plantations in the Fiji Islands. Alam et al. (2004) submit that in order to protect the Fijian culture and traditions, the Indian workers were imported under the indenture system contract to work in the sugarcane plantations. These workers were mainly brought in so that the cheap labor supply demands of the Australian capitalist, the Colonial Sugar Refinery, could be adequately met.

Prasad (2009) highlighted that Indo-Fijian work ethics brings communal stability in the working environment in Fiji. Traditionally, the Indians were recruited from India to work in the sugarcane plantations because these Indians had the discipline and strong work ethics and could start the economic system in Fiji. The Indians recruited under the indenture system were able to adjust to different working environments easily. For instance, during the *Girmit* period, women used to work in cane fields even if they were pregnant. Presently, it is seen as against the Employment Relations Promulgation Act (2007) if pregnant women were compelled to work in the sugar cane plantations.

## Application of Scientific Management and *Girmit* System

The British Empire, together with the Colonial Sugar Refinery (CSR) Company, used several deceptive ways to recruit the Indian workers (Lal 2004; Naidu 1980). There were several reasons for using these ways to recruit workers to work on the sugarcane plantations in the Fiji Islands. First, in order to establish fully functional industries in Fiji, it was becoming extremely difficult to use the Fijian laborers in the sugarcane plantations. Therefore, the purpose of using Indian laborers to work in the sugarcane plantations was to maximize productivity, and this was based on the tools of scientific management. Under the principles of scientific management, the employers would go to any extent to maximize the productivity of the workforce.

Achieving maximum productivity from the workers in the sugarcane fields in Fiji required the use of highly productive Indian laborers – who demonstrated their ability to produce high output in sugarcane plantations in other parts of the world too. Next, if Indian laborers did not see a better future in Fiji, it would have been difficult to recruit them to work in the sugarcane plantations. Some of the foul ways that were adopted by the CSR with the support of the British rule were informing the Indians that they had an optimistic future in Fiji, and they would be earning much more than they would be earning in India (Naidu 1980). Under the Scientific Management philosophies, using foul ways in recruiting workers is not a problem as long as these foul methods help organizations to recruit best workers to maximize the productivity of the workers. The task system under the British indenture system was too difficult for the workers.

Additionally, one of the fundamental tools of the scientific management system is to reduce costs to maximize the productivity of the per dollar input in the organization. The *Girmit* workers were kept in the barracks that comprised of three single men. For men who were married, they were kept with their wives and children. Some indentured laborers described the barracks as "horse stables" (Naidu 1980). Due to overcrowding in the barracks and the indenture laborers' suffering health, the British colonial administration implemented legislation in the year 1908 that provided bigger and detached rooms for the workers. During the *Girmit* era, there was no system in place to measure the

productivity of workers. The CSR officials believed that working in the sugarcane plantations required intensive physical labor. Therefore, men were producing more than women at the workplace. As a result of this, men were paid more than the women in the sugarcane plantations (Naidu 1980).

## Application of Bureaucratic Principles and *Girmit* System

During the *Girmit* time era, the British Empire had rules and regulations, as those provided the framework to guide the relationship between the CSR and the indentured laborers. According to Weber's principles of bureaucracy, rules, and regulations are needed in the public sector so that the state can achieve its objectives. Unfortunately, during that period, the objectives of the state were to establish commercial industries so that the output from the public sector could be maximized. In order to achieve this objective, the Immigration Ordinance Act was implemented by the British Rule (Naidu 1980). This Act was designed to support the practices of the CSR Company. For instance, the workers were assigned tasks that had to be completed, and if these tasks were not completed, then the workers were severely punished under the Immigration Ordinance Act.

Additionally, there were a lack of implementation of rules and regulations at the workplace, and there were no mechanisms put in place to ensure that these were followed at the workplace (Naidu 1980). The internal characteristics of the indenture system, such as task work and penal code, made it difficult to have a good working relationship between the British rule and the indentured laborers. Due to poor implementation of the labor ordinances, the CSR Company became a dominant stakeholder in the private sector, and the workers could not do anything but to protect themselves if they were mistreated. The CSR Company did not follow the labor ordinance that was implemented by the British rule on several occasions. According to the labor ordinance, the CSR was required to give rations to the Indian laborers in the first 6 months. However, the amount of food received by the Indian families was insufficient, and this harmed the health of workers working on the sugarcane plantation.

Moreover, there were no regulations to guide the type of medical services that were provided to the indentured laborers. The medical services that were provided to the indentured laborers were provided by the people who did not have qualifications in the area of medicine (Naidu 1980). There were no regulations for the necessity of health services that were to be provided to the indentured laborers. The CSR used many forms of violence against the indentured laborers. The planters, overseers, and *sardars* (supervisors) were three groups of people who were controlling the sugarcane plantations. These three groups of people used different types of violence on the indentured laborers. There was also violence among the indentured laborers, and some of the reasons for this violence were overcrowding of houses, prostitution, and lack of availability of proper food (Naidu 1980). The government did not provide any regulation to control this conflict. The labor ordinance regulated the first form of violence, that is, the violence on the indentured laborers by those in power. However, due to a lack of implementation of the labor ordinance, this type of violence was not curtailed. There were no regulations that restricted violence among the indentured laborers.

This entry essay has emphasized that Taylorism and Weberian management philosophies were practiced during the *Girmit* period. The approach in which the public sector was managed during the *Girmit* era with Taylorism and Weberian philosophies is different from the way the public sector is managed in the modern era. First, some of the important practices of Taylorism prevalent during the *Girmit* period were task payment, barrack housing, violence, and corporal punishment to squeeze the maximum out of the workers. These were some of the tactics used by the state in conjunction with the CSR Company to improve worker productivity. The "indentured system" or *Girmit* had much relevance to the Scientific Management theory (SMT) when the indentured laborers were forced to work in the sugarcane fields, an environment that was not of their choice. SMT contends that in order for the workers to

work hard, they must be compelled to produce the maximum output, which on the contrary, failed to consider their physical and their mental well-being (Ramasamy 2009). Another contribution of this entry essay was the emphasis on the work rules that were directed toward work and the maximization of sugar production.

Second, state bureaucracy was present during the *Girmit* era but to a limited extent. The bureaucracy existed to benefit mainly the CSR Company rather than the indentured laborers. Surprisingly, the bureaucracy was quite low in areas, such as defense, health care, and education. Nonetheless, during the indenture system, the children of the indentured farmers did not have access to the proper schooling system.

The indentured laborers that were brought to work in sugarcane fields in Fiji worked in very harsh conditions that were characterized by poor hygiene and inadequate sanitation practices. Therefore, the work environment is an important factor that must be taken into consideration if organizations are keen on enhancing high levels of efficiency and performance of various individuals. From the experiences gained during the indenture period, it is evident that in order to maximize worker output, the organizations must provide proper and adequate working conditions to workers.

Lower morale of employees contributes to decreased commitment levels and productivity levels. Therefore, it is paramount that the welfare of workers is adequately looked after, especially if organizations are intending to increase the performance of their staff. During the indenture system, there was an absence of labor ordinances, and this contributed to extensive labor exploitation through false promises directed to those who were being recruited. In light of this, there is a need for enactment of proper regulations to facilitate effective labor movement and to protect the vulnerable and weak sections of the community.

## Conclusion

The main aim of this entry essay was to discuss public administration during the *Girmit* era. This entry essay found that different forms of bureaucracy and scientific management practices were present during the *Girmit* era. Additionally, these were significantly different from the forms of bureaucracy and scientific management principles that exist in the workplace today. During the *Girmit* period, some of the Taylorism practices prevalent were task assigned payments, barrack housing, violence, and corporal punishment to squeeze the maximum out of the workers. Bureaucracy mainly existed during the *Girmit* period so that the state could fully support the CSR Company to get the maximum output out of the workers.

One of the limitations of this entry essay is that it is based entirely on the Fijian indenture system. Therefore, cross-country comparisons cannot be made on the indenture practices adopted in other countries around the world.

# Public Administration in Kyrgyzstan

Mahabat Baimyrzaeva
Graduate School of International Policy and Management, Middlebury Institute of International Studies at Monterey, Monterey, CA, USA

## Synonyms

Governance in Kyrgyz Republic; Kyrgyzstan's bureaucracy; Kyrgyzstan's government reforms

## Introduction

This article introduces readers to key features of and developments in Kyrgyzstan's public administration. It starts with a brief review of the context of Kyrgyzstan's public administration, including its geography, history, economy, and politics that shaped the way the government operates. Its structure and policy functions are summarized next. The following section reviews key challenges and reforms intended to address them. The article concludes highlighting some of the strengths within the system that could be leveraged to make it more effective.

## The Context of the Public Administration

Kyrgyzstan is located in Central Asia. It is surrounded by China, Tajikistan, Uzbekistan, and Kazakhstan on a mountainous terrain of about 200,000 km$^2$. The great mountains that divide the country into northern and southern parts, its geographic isolation from the rest of the world, lack of access to sea routes, and rough climatic conditions partially account for resilience and adaptability of the historically nomadic people of Kyrgyzstan. These same forces have created significant barriers for building and maintaining both physical infrastructure essential for integration and economic development as well as governance infrastructure essential for effective public administration.

Kyrgyz people lived in surroundings of Yenisei River in Siberia and Mongolia for centuries, at least since 200 BC. They relocated to Kyrgyzstan's current territory around eleventh to sixteenth century AD. They did not leave many physical traces as their lives were woven into the nature's patterns they tried to fit in without disrupting it. They lived in groups of families called clans which were in turn organized into tribes. The tribes were ruled by executives (*bi* or *bek*) in charge of responding to group's needs, and councils of elderly (*kurultai*) in charge of advising the executives, deliberating on important decisions, and adjudicating conflicts. While the tribe leaders occasionally got together on special occasions, the decentralized governance structure and nomadic ways did not lend themselves for building a nation state with rigid territorial boundaries or to subjecting them to direct colonial control (Abazov 2004; Baimyrzaeva 2012).

This lasted until late nineteenth century when military tsarist Russia took full control of the territories where Kyrgyz people lived by way of co-opting local chiefs and using military power. The colonizers also distributed those lands to large settlements of peasants brought down from Central Russia and Ukraine. These developments built up resentment among locals and eventually erupted into a popular uprising in 1916. In 1917, when Bolsheviks overthrew the Tsarist Russian Empire, Kyrgyzstan, along with its other colonies, became one of the Soviet states with its own territory (Abazov 2004).

The Soviet regime instituted extensive four-tiered governance system to administer peripheral republics like Kyrgyzstan. Local cadres were trained and indoctrinated in the Communist Party's ideology and set back to leadership

positions. The state and all its officials served the Communist Party which made key policies and controlled essential appointments. Still, this system did not erase the preexisting informal networks. They survived, especially in rural areas where soviet collective farms were established on the basis of preexisting familial kinship networks.

Kyrgyzstan considerably changed in many ways during the Soviet Union. Economically it started off as a supplier of agricultural and mineral raw materials to more industrially developed parts of the Soviet planned economy. Over time, by 1990s one third of the country's economic output was coming from industrial manufacturing sector (Abazov 2004). An extensive educational system from preschool to universities was developed. Literacy rates jumped to above 99%. Health outcomes greatly improved in matter of decades. Large physical infrastructure projects such as hydroelectric plans and roads were built on a difficult geographic terrain.

At the same time, the identity of the people had been tinkered with in a quest to engineer a soviet citizen. The nation's top intellectual elites were sent to labor camps and killed during Stalin era. This was done to induce greater conformity to the regime and preempt independent thinking, which largely worked. The Kyrgyz people were more disadvantaged in terms of accessing higher education and white-collar professions since they mostly lived in rural areas working in agricultural sector. In contrast, Slavic populations, despite being a minority, were disproportionately concentrated in cities, universities, and better paying jobs.

Kyrgyzstan's economy sank in 1991 along with the dissolution of the Soviet Union and breakdown of its densely connected economic network. This problem was fueled by hastily executed large-scale privatization of economic enterprises, all of which were owned by government, at that time. The new owners, lacking investments and lured by quick money, sold off expensive machinery and equipment, often for scrap metal. Kyrgyzstan's industrial and agricultural sectors collapsed. Internal demand did not emerge quickly enough as majority of the population became impoverished. The privatization disproportionately benefitted the circle of political elites, who now became new economical monopolies. They still used political positions to protect and advance their economic and personal interests. The economic hardships of the majority, in turn, fueled massive internal and external migration of people especially from the most isolated parts of the country.

Demographic indicators reflect these political and economic developments. Officially, Kyrgyzstan's population is close to 6.3 million as of 2018 (National Statistical Committee of the Kyrgyz Republic (NSC) 2018a). Out of this between 650,000 and 700,000 people – about one fifth of its 3.7 million labor force – are living and working abroad, most of them in Russia (National Institute for Strategic Studies of the Kyrgyz Republic 2016). It is not a coincidence that Kyrgyzstan tops the list of the countries receiving remittances as a percentage of GDP at 35.4% (International Organization for Migration 2018).

The country's population is still diverse and very young. Population's 73% are ethnic Kyrgyz, while among about hundred minority groups the largest are Uzbek (14.7%) and Russian (5.6%) populations. Nearly 30% of all people are under 14% and 47% under 24. The population is concentrated in the capital city Bishkek (over one million) and the next largest southern city Osh (233,000).

The economy started slowly recovering by early 2000s. The GDP per capita in Kyrgyzstan is $1220 (in current USD). The average salary in the country is around $223/month, including for government employees, although many families' incomes are supplemented by remittances. The inflation has been stable at about 2.9% (NSC 2018a).

Around 90.5% of all employed workforce work in private enterprises. Currently the most dominant sectors of the economy in terms of employment are agriculture and trade, accounting for a slightly more than 40% of all employment in the country (NSC 2018a). Businesses face difficulty attracting reasonably priced investments despite emergence of promising new sectors ripe

for growth including in agriculture, garments industry, and tourism. Current interest rates are too high at about 20% even though the country has a relatively low ratio of loan defaults (7.4%) and stable national currency (National Bank of the Kyrgyz Republic 2018). In the World Bank's Doing Business ranking for 2017 Kyrgyzstan is ranked 77 out of 190, slightly above China. The history of two public revolutions and property disputes under the first two presidents still seem to remain significant deterrents for potential investors.

The government accounts for about 10% of total employed people (NSC 2018a). This share of public sector employment is rather high compared to the world average of 5–6% (Heady 2001). As of 2016, altogether about 100,000 people were employed in government offices alone (NSC 2016). The remaining public sector employees seem to be predominantly concentrated in law enforcement, public education, and health sectors. Not surprisingly, the largest expense in the national budget were salary payments to public sector employees (38%) and social security payments (16%) as of 2016 (NSC 2016).

The public administration is not representative of the general population's composition in terms of gender and ethnic ratios. This directly or indirectly affects government services and policies towards different segments of the population. For example, women who constitute 50.4% of the general population make up 40% of all public administration staff. They are mostly concentrated in lower tiers of health, education, and social sectors. About a quarter of senior level, political positions were occupied by women (UNDP 2012). Minorities are infrequently employed in the public sector.

UNDP's Human Development Index for 2018 was 0.672 (UNDP 2018). This index is higher compared to many countries which have higher GDP per capita. This could be due to a number of factors. The public education continues to be free, and the country has a high literacy rate of above 99%. The government also provides free universal healthcare. The people receive significant share of their income in remittances. Last and not the least, the culture of caring for relatives and availability of free services within broader self-help groups in rural areas that do not register in formal economic transactions also could be playing a role.

The current constitution describes Kyrgyzstan as a democratic, parliamentary, and secular republic. The legislative authority is vested on the unicameral national parliament (*Jogorku Kenesh,* translated as "Higher Council"). It is made up of 120 representatives elected nationwide using proportional system where public directly votes for parties. Among the three branches of power, the executive's formal authority by far exceeds the others, even though the previous president Atambaev championed constitutional changes in the 2016 referendum claiming to make the system "fully" parliamentary. The president still retains the power to appoint heads and deputies of law enforcement and security ministries, holding disproportionate influence over them while also excluding them from parliamentary oversight. The 2016 referendum also resulted in the judicial branch's decreased independence with the increased presidential and parliamentary authority over the judges' selection and dismissal.

The public expects the government to ensure economic security above all. The latter is considered to be significantly more important than using democratic governance methods (World Values Survey 2011). Still, most people seem to believe they can influence the government. The voting rate in national elections is quite high, where 66% said they "always" participate and 30% said they "usually" participate (ibid).

The country also has a relatively healthy political opposition, liberal media, and vibrant civil society compared to its neighbors. In particular, formal nongovernmental organizations (NGOs) grew rapidly in the 1990s in large part fueled by funding from international organizations. Their numbers increased from 3019 in 2001 to 21,000 in 2011 (Baimyrzaeva 2012). For the last several years their numbers seem to have stabilized at around 20,000 (NSC 2018a) partly due to reduced donor funding.

Besides these formal NGOs, in rural areas the society is held together via a dense network of

self-help groups formed mostly on the basis of familial kinship. These groups support their network members in good times and bad. (For example, they show up to help members during organization of large festivities, construction of their homes, and take charge of elaborate logistical tasks during funerals, among many other things.) They also seem to be one of the reasons why inequality is relatively low, and homeless or abandoned people are rare in rural areas.

## Public Administration System

The government policy and services are administered via central and local governance institutions that have preserved many features of the Soviet government. The national level government consists of the prime minister's office and the cabinet with 12 ministries. The ministers are nominated by the prime minister subject to approval by the president with the parliament's consent. The remaining four ministry-level bodies called "committees" are also part of the government though they are directly accountable to the president who appoints their heads, as mentioned above. Altogether public administration at national level is carried out via over 40 government ministries, committee, agencies, services, foundations, and inspectorates.

The local government bodies exercise public administration via three hierarchical administrative layers also preserved from the previous Soviet system with some modifications. The lowest government administration at municipal level consists of 459 *ail okmoty* – local communities consisting of villages and/or towns – averaging 12,712 residents in each. These local self government institutions led by the executive (*ail okmotu*) and local councils (*kenesh*) co-exist with local state administration institutions. The *self*-government body's executive and the council members are directly elected by residents of a given territory, but have less authority than the local state administration's office. The head of the local state administration is in charge of the local government budget and is appointed by the prime minister.

The intermediate *rayon* level encompasses several *ail okmoty* and smaller cities. Altogether 40 *rayons* and 23 cities comprise this level. The top level in local governance is comprised of seven *oblasts* that encompass several *rayons* each. In other words, villages and small towns organized into *ail okmotu* report to the *rayon* level; the heads of *rayon* and smaller city administrations report to the *oblast* level; and *oblast* governors in turn report to the national level officials.

Local state administrations and self governments use transfers form the national government, limited local taxes, and income from local property to fund and oversee the delivery of vast government services. This includes public education, law enforcement, all utilities (such as water, sewage, gas, trash collection, public transportation system, roads maintenance, etc.), managing land use, construction permits, emergency services, and local economic development.

## Policy Process

The policy making process is dominated by the executive branch while the legislative body usually follows the executive's lead. This is yet another example of continuity from the Soviet regime. It does not help that legislators have a very small staff and analytical support units for policy development.

The strongest policy analytical units within the executive branch are found at the National Bank and Ministry of Finance. They have benefitted from extensive capacity building opportunities from donors from the start being central to macroeconomic reforms. They also have higher salaries and prestige to retain the best and the brightest. Most of the remaining government agencies have much room to grow in developing their policy analysis and implementation capacity (Baimyrzaeva 2012).

Evidence-based policy making is yet to become a common practice in government. Government officials and civil servants are not generally well trained in policy-analysis skills partly because most of the universities that train them

still tend to teach theory. Government research institutions such as the National Institute of Strategic Studies and the Academy of Sciences are not commonly consulted with in policy development (ibid).

A number of NGOs and independent experts have developed considerable and analytical skills and expertise in evidence-based decision-making as well as in monitoring and evaluation while working with donor projects. However, their involvement in government's policy-making process remains limited due to a number of reinforcing factors. This includes a secretive culture of the bureaucracy, corruption, defensiveness about their own lack of competencies, and lack of incentives for involving local experts. General public influences policy formulation mainly via demonstrations and media stories besides voting for parties (ibid). In contrast the executive branch has been much more open to donors' influence in developing government policies.

This is because key donors such as United Nations Development Fund (UNDP), the World Bank, International Monetary Fund, Asian Development Bank, and Unites States Agency for International Development, among others, usually provide funds experts to advise the government on related policies.

In implementing policies, as evident above, the functions, responsibilities, and authority among national level government units, as well as among units at multiple tiers of sub-national governance bodies significantly overlap. This leads to confusion, conflicts, and accountability problems.

Monitoring and evaluation of the government's work is becoming a more accepted, albeit not always systematic, practice as more and more units are entrusted with it. For example, parliamentary committees have the primary responsibility for monitoring implementation of laws passed by the parliament, but legislature's staff is still too small to systematically perform this role. The Ombudsman, elected by and reporting to the legislature, is charged with monitoring implementation of human rights and addressing citizens appeals with regards to their interactions with government units. The National Bank monitors the banks to ensure implementation of monetary policy. The Audit Chamber monitors how national and local government bodies are using public funds.

From outside the government, media is accustomed to exposing and publicizing problems in government's policies and operation. This is an effective way to draw attention to key problems because the Prosecutor's Office is required to respond to media reports.

Another promising innovation introduced to monitor public administration is the Councils of Public Observers (*Obshetvenni Nabludatelni Sovety*) initiated by the ex-president Roza Otunbaeva. These Councils consist of independent citizens, members of civil society organizations, and experts. They are expected make the government more transparent and open to public, to monitor the use of public funds, and to curb corruption. Even though the public observers' recommendations do not have binding authority on respective government units, they have significant levers in their discretion to influence the culture of government organizations. The public observers can convene public hearings, form working groups, and inform the public and the media about their work (Baimyrzaeva 2012).

## Key Challenges and the Reforms

There are many challenges undermining effectiveness of Kyrgyzstan's public administration. These include low salaries, inadequate capacity, secretive bureaucratic culture, limited accountability, and loyalty to political patrons over needs of general public (Baimyrzaeva 2012). At the core of these deficiencies lies corruption. According to Transparency International, Kyrgyzstan has been consistently scoring low in this measure for the last few decades among the lowest quarter of surveyed countries (24–29 out of 100 between 2012 and 2017). In 2017, it was ranked 135 out of 180 countries (Transparency International 2017).

The government's own surveys provide even more nuanced view of this problem. The "Public Confidence Index" surveys the public measuring

trust, performance, and corruption perceptions in each government body in Kyrgyzstan since 2012. It is administered by the National Statistical Committee of the Kyrgyz Republic bi-annually using a random sample of 3600 respondents from all over the country. In 2018, the most corrupt organs were generally the worst performing bodies: Customs Service, the Government Agency for Enforcement of Punishments, and the Ministry of Interior (NSC 2018).

The causes of corruption are many. The most important cause seems to be institutional. The initial reforms in 1990s when Kyrgyzstan became independent from USSR were more concerned with democratizing political institutions such as the electoral system, and on freeing the market via privatization and other macroeconomic reforms. There was also an urgent need to transform the administrative system inherited from the USSR to support the democratization of the political system. The soviet bureaucracy was well trained in implementing top down policies set in Moscow and serving the Communist Party. But it was not equipped to develop and implement new policies to promote and enable private and nonprofit sector and serve the public.

However, reforming the administrative system was not seen as a priority, at least in the beginning. The donors who promoted early reforms assumed that better government was a small government and that functional administrative institutions would fill the "institutional vacuum" once macroeconomic reforms were implemented. Hence, administrative reform at this stage was mainly reduced to privatization and downsizing with the exception of Central Bank and Finance Ministry as mentioned above. In the remaining parts of the government, well-run administrative institutions did not emerge on their own.

The bureaucracy that actually emerged was neither democratic or effective. The President's Office came to fill the Communist Party's shoes including by commanding over the bureaucracy. Between 1991 and 2010, the first two presidents built up a super-presidential state via several constitutional changes. (This is in stark contrast to the way the first president Akaev started as the most liberal and democratically minded head of state in the region who wanted to turn Kyrgyzstan into "Switzerland of Central Asia.") They brought under their direct control the executive branch, including civil service, and local governments, including via creation of parallel structures, while weakening other branches of power. Political appointments and civil service staff alike turned into a lever for shaping election results, while also serving as a source of favors in exchange for loyalty and also money in some cases. Institutionalized corruption quickly blossomed and replicated down the chain all the way to street level bureaucrats.

Administrative reforms initiated from late 1990s to 2010s have been unsystematic and mostly cosmetic partly because the political leadership lacked incentives to change the system. Establishing truly merit-based civil service would limit politicians' control over the system. Slight changes to the legislation on *state* service, functional reviews, and creation of state secretaries in ministries and agencies did not make much difference. Similarly, giving more autonomy to local self-government bodies or eliminating duplicate local state administrations would limit the president's ability to control elections. Greater accountability and transparency, even when declared in policy documents, were precisely what the political leadership at that time did not want.

In 2010, the constitution was rewritten, and the power was more equally distributed among the three branches. A number of measures are being carried out to curb corruption to some degree. The anti-corruption measures and campaigns target some of the officials. So far, it has not been widely effective in targeting high-level officials in most corrupt agencies such as customs and law enforcement. A policy requiring public officials to fill annual declarations of personal income has been a toothless instrument since illegally acquired property can be registered for family members. The anti-corruption campaigns also have been selectively used to target political opponents.

At the same time, the administrative reforms undertaken since 2010 could have better results compared to the previous reforms as they are being implemented in a slightly different political

environment. Among such reforms, a few are worth mentioning. The Councils of Public Observers at all 40 plus government ministries and agencies could improve how the government operates and interacts with public as detailed above. The State Personnel Service is in charge of ensuring merit-based recruitment and promotion of civil servants using personnel reserve database for all government units' use. The database has not been systematically used by most government agencies (UNDP 2012), but they are trying to make it a common practice. The 2016 changes to the Law on State Civil Service and Municipal Service more clearly distinguished political and civil service jobs. E-governance reforms that increased IT capacity of the government had some effect on the overall performance of the government. They were revived in 2017 as part of the new effort to reform the public administration.

It is hard to know exactly what impact these administrative reforms made for the last several years partly because the government's performance and level of public satisfaction with it usually mirrors political and economic developments. The latter are affected by external factors as much as by internal reforms. Large-scale changes to transform the complex public bureaucracy also require time.

## Conclusion

For over two decades Kyrgyzstan's public administration has been evolving while caught between two powerful forces. On the one hand, aspiration to democratize and economically and socially develop pulls is forward. On the other hand, it is still cast in the spell of its authoritarian past. Challenges that Kyrgyzstan's public administration faces also reflects larger shifts in public administration globally where public sector is increasingly expected to adapt and innovate to respond to the changing environment.

The government in Kyrgyzstan continues to deliver free education and healthcare, and prides itself with a democratic government with strong civil society, despite the low GDP per capita, geographic isolation, corruption, and low salaries. To extend and improve upon the positives, the government could take further steps.

The education system will benefit from revamping to better meet the demands of the knowledge economy. The health system will need additional investments to update its ageing infrastructure and equipment. Furthermore, the government could get better at recognizing and building on strengths within the society, and leverage them to a greater effect. For example, public administrators could supplement their own expertise with skills and knowledge of experts from civil society and think tanks. Involving them in this process, in addition to improving the quality of policies, might also help limit corruption.

Another strength within the system is the strong culture of self-help and collective responsibility that people still harbor. People have been self-organizing and solving collective problems locally using informal institutions and customs through difficult economic conditions. Public administrators should at the very least avoid undermining, and at best, preserve, strengthen, and build on them.

The government could support innovation both within and outside the government. For example, it could incentivize establishment of incubators and accelerators to identify more effective solutions for a host of social, economic, and technological problems. The diversity of the people can be an asset in developing novel solutions.

Kyrgyzstan has taken many steps to build a well-performing public sector. It has still a lot of room to grow in its never ending endeavor.

# Public Administration in Morocco

Rabia Naguib
School of Public Administration and Development Economics, Doha Institute for Graduate Studies, Doha, Qatar

## Synonyms

Bureaucracy; Governance; Hybrid regime; Makhzen; Monarchy; Moroccan government

## Introduction

Public administration may have different meanings and varies in form and scope. It is an academic field and a professional activity and a combination of theory and practice. Linked to a country, it refers to the government and activity of the state. The purpose of public administration is to "promote a superior understanding of government and its relationship with the society it governs, as well as to encourage public policies more responsive to social needs and to institute managerial practices attuned to effectiveness, efficiency, and the deeper human requisite of the citizenry" (Henry 2007).

Public administration is intrinsically entrenched in a set of values and philosophy, which are translated in activities representing responses and reactions to its sociocultural, political, and economic surroundings. It is therefore important to relate public administration to its context in order to understand its conception and practice. Through the case of Morocco, the nature and the role of the government and its interaction with the citizens will be explored. It is also interesting to draw a parallel between the evolution of public administration as a discipline at the academic level and as a praxis at the country level.

## Evolution of Public Administration

As a discipline, public administration has evolved to respond to the continuous challenges of the changing times through paradigm shift and the development of different models. Succinctly, its evolution can be traced through the progress from an Old Public Administration approach to a New Public Management (NPM) during the 1980s and 1990s to enter starting from 2000 the era of New Public Service or Governance (Robinson 2015).

Public administration praxis in Morocco, as it is the case in most developing countries, seems to have remained static and stuck in the old approach of public administration and the traditional administrative model, in spite of several initiatives promoting the modernization and democratization of the political and administrative government

apparatus. This model or paradigm takes the form of a bureaucratic organization with top-down structure, where the role of government consists in "rowing" and implementing politically defined objectives, and the civil servants' motivation is derived from pay, benefits, and civil service protections. Comparatively, the NPM is based on economic theory, rather than political theory, promoting technical and economic rationality seeking to serve customers through decentralized public organizations, and the role of government consists in "steering" serving as a catalyst to unleash market forces, and the motivation of civil servants comes from an entrepreneurial spirit and the desire to use resources efficiently. Placing citizens rather than government at the center of its frame of reference, the New Public Governance (NPG) approach adopts a different starting point from the two previous public management traditions (Osborne 2006). It draws on democratic theory and emphasizes "serving," rather than controlling, as a public service ethos while promoting collaborative structure with shared leadership, and the motivation of public servants is to contribute primarily to society and to the wider public good (Denhardt and Denhardt 2000).

Obviously, in many developing countries, as it is the case in Morocco, there is a persistent adoption of the traditional public administration paradigm and a lack of integration and implementation of contemporary approaches to public management and good governance. It is reflecting in the government apparatus where citizens are still treated as passive recipients of top-down policy making and bureaucratic service delivery mechanisms and where control and hierarchy rather than plurality and engagement are the rule (Robinson 2015). Such approach to public administration and static position represents a serious obstacle to any form of public sector reform as the example of Morocco shows.

## Evolution of Public Administration in Morocco

To understand the activity of public administration in Morocco, we have to link it to the history of the state formation and the nature of government of this century-old monarchy where the royal dynasty has ruled the country since 1649. The Moroccan regime represents an interesting case in the MENA region with a reigning monarchy caught between the driving forces of modern and democratic changes and the pervasive power of traditional and authoritarian rules. A core concept and system marking this regime consist in what is known as *Makhzen* (literally meaning "warehouse") and implying the functions of conservation, preservation, and protection. The term has different connotations ingrained in the Moroccan culture. It refers to the "central administration together with the Sultan's governmental suite." It is associated with traditional authority, informal rules, shadow power, bureaucracy, and elite related to government in Morocco. Hence, the Makhzen originates in the feudal state, and contributes to its perpetuation through a patrimonial and authoritarian system, predating the colonial era (1912–1955). French colonial apparatus used this system to "help maintaining order" in Moroccan administrations of several regions while modernizing its "coercive and extractive capacity" (LeVine 2012) using a repressive penal code (El Malki 2017). After the independence in 1956, the Makhzen contributed to the process of state building in Morocco (Daadaoui 2011).

Independent Morocco's first constitution, promulgated in 1962, set up a "constitutional monarchy," seeking to establish democratic institutions recognizing to Moroccans of all denominations, the rights as citizens and the exercise of public freedoms and participation, while concentrating the executive and legislative powers in the hands of the monarchy and establishing the political supremacy of the crown. Amendments made to the constitutional text in 1970, 1972, 1980, 1995, and 1996, during the reign of Hassan II, strategically enabled the king to engage with the opposition elites and civil demands while continuing to play a key role in the government and administration of the country.

After coming to power in 1999, King Mohammed VI defined the Moroccan regime as an "executive monarchy" and reaffirmed the central role of the king at all levels. He also made reference to

other concepts such as "institutional governance" or "institutional reform" as a way of responding to pressing issues raised by the civil society. In the context of the popular uprisings in the region, and in reaction to the social movement initiated in February 20, the monarchy decided to move ahead with constitutional reforms drafting and adopting a new constitution in 2011. King Mohammed VI proceeded to the establishment of the Economic and Social Council followed by the creation of the National Human Rights Council (NHRC), replacing the Consultative Council on Human Rights (CCHR) that was established in 1990. The declared objectives of the initiated reforms consist in "developing a new social charter based on major contractual agreements that create the right environment to meet the challenge of revamping the economy, boosting competitiveness, promoting productive investment and encouraging public involvement to achieve development at a faster pace" (Madani et al. 2012). According to the king, the constitutional reform was destined to lay the basis for an "efficient, rational constitutional system whose core elements are the balance, independence and separation of powers, and whose foremost goal is the freedom and dignity of citizens" (Tremlett 2011).

The new constitution represents a positive step toward reacting to popular pressure for change and a catalyst to the transition of the kingdom to the New Public Governance model, placing citizens at the center of the public administration philosophy and objectives. The recognition of new rights, the capacity building for the parliament and government, the legitimation of regulatory bodies as well as the promotion of human rights, and civil participation constitute important breakthroughs. Still, according to many observers, the constitution has not established a true parliamentary monarchy. The king granted limited executive powers to the head of government (prime minister). He retained significant authorities, including the ability to dissolve parliament. He preserved the king's role as an arbiter of political decision-making and remained commander in chief of the armed forces and the country's preeminent religious authority. The king also maintained a "shadow government" of royal advisors (Arieff 2013). Legislative elections held in 2011, under the new constitution, brought to power an Islamist political party, the Justice and Development Party (PJD). The PJD has sought to institute important economic and governance reforms (Ottaway 2011). However, the party has to overcome the challenging transition from an outsider opposition role to the responsibility of policymaking, in addition to managing the tensions with pro-palace elites, as well as with nominal allies (Arieff 2013).

Obviously, the Moroccan regime seems to be marked by a dichotomy between the aspiration to a liberal democracy and the perpetuation of a traditional long-standing monarchy, generating a dual administrative system operating in the kingdom, one, corresponding to modern state function of bureaucratic and administrative governance, and another, traditional in nature functioning as a "deep state" and reproducing the patrimonial and authoritarian system of Makhzen. As underlined by Kausch (2008), "the debate about constitutional reform is a debate on the distribution of powers in the country, and as such it touches the very heart of the Makhzen." Also, as pointed by El Malki (2017), "the new government is a reflection of how much strong is the Makhzen and how much limited impact elected governments can have on decision making and in implementing public policies." In sum, this situation illustrates clearly how Makhzen has had a remarkable continuity in Morocco given its ability to cast and adapt its traditional, patrimonial, and symbolic power within modern political institutions (Daadaoui 2011).

This peculiar relationship between rational mechanisms and traditional practices helps understand the current state in Morocco and its mode of government and public administration. This system corresponds to the conception of public administration as being both an *institution of public service*, providing public goods, and a *center of power* concerned with the elite's own privileges represented by the Makhzen. This dualism has apparently obstructed the progress and development of Morocco in spite of many undertaken public reforms.

## Public Reforms in Morocco

In the latest Democracy Index released by the Economist Intelligence Unit (2016), Morocco is considered as a hybrid regime ranking number 105 of 167 countries judged for the fairness of the electoral process, civil liberties, government functioning, political participation, and political culture. In terms of human development, the kingdom is placed 129 of 187 countries (UNDP 2016). Out of 129 countries, it ranks 81 in the Management Index, 73 in Economic Transformation, and 93 in Political Transformation (BTI 2016). Meanwhile, the country scores high in the Corruption Perception Index placed 90 of 175 (Transparency International 2016). Noticeably, the country is performing better in economic growth than in social development. Overall, these indicators are symptomatic of internal flaws and inefficiency of the Moroccan government and public administration and explain the widespread public dissatisfaction with its low performance and weak governance.

In many Arab countries, increasing dissatisfaction among citizens with the functions of government and the provided services by public administrations led to youth mobilization and protests calling for modern and global values such as human rights, democracy, freedom, and gender equality, and demanding real citizenship rights, and to be treated by their government with dignity (Hissouf 2014). In Morocco, mobilizations led by the February 20 movement included a series of nonviolent demonstrations asking the monarchy for reforms and for greater social justice and democracy. Therefore, following a worldwide quest toward greater efficiency and cost savings instigated by some donors and international organizations, such as the World Bank and the IMF, Moroccan government initiated reforms subscribing to New Public Management paradigm. Two of the more commonly adopted elements of the NPM agenda are privatization and downsizing (Polidano 1999).

Since 2002, the Moroccan government, with assistance from the World Bank, has initiated a comprehensive Public Administration Reform Program (PARP). This reform aims at improving public administration, making it leaner, more focused, and more efficient in the delivery of social services. Through this program, Morocco's administrative tradition was aspiring to move from strict and bureaucratic legal compliance to a search for better performance and more effective public service (World Bank 2010). The key components of the PARP include increased internal and external controls, improved human resource management (HRM), increased quality of public services, consolidated and managed public sector payroll, and simplified administrative procedures through the development of e-government or digital governance (Kettani and Haddouti 2003). Improving HRM in the public sector while reducing costs to the national purse is representing one of the major challenges to the Moroccan government in the public reform.

In Morocco, as in developing countries with bloated and inefficient bureaucracies, some measures of downsizing and efficiency reforms in the public sector represent a priority to bring spending on public administration within manageable fiscal limits. Reflecting its colonial experience, Morocco's public sector is characterized by centralized procedures leading to inefficiency in the use of public resources. Moreover, human resource management is dominated by a tenure system that provides little incentive for good performance (El Massnaoui and Biygautane 2011). After the country's independence, the administration at that time had to build a modern administration while avoiding creating a total break with the system inherited from the protectorate period. The first steps taken by the government were to respond to the concern of the National Movement to "moroccanize" the personnel of central administrations and to ensure a strong territorial presence of the state at the level of the regions and provinces of the kingdom. Over a relatively short period, the administration had to hire a large number of civil servants. But their qualifications and profiles were often not in line with the requirements of the positions held. Since 1954, the number of public service employees in Morocco grew rapidly from 32,000 to an estimated 679,638 in 2002. Compared to other MENA countries and to most of the governments worldwide, Morocco

spends a relatively large portion of its GDP (14%) to pay the salaries of its bureaucrats, out of proportion to its 7% share of the labor force (Ministry of Economy and Finance 2015). Moreover, the statutory basis for HRM in the civil service, set in 1958, is clearly outdated, inflexible, and obscure, and there is a growing gap between the skills required and the competences of available staff. The objectives of HR set in the PARP consist in creating a better match between job requirements and the skills of the workforce; improving transparency in promotion, appraisal, and pay; and creating a coherent and continuous training policy (World Bank 2010).

Major plans and programs have been deployed aiming to improve public service performance and efficiency. However, reforms could never go beyond the stage of the adoption of a law, and structural obstacles hinder the implementation of the programs. In a study assessing the governance of public services in Morocco, the perception of users remains overall negative. The relationship with the administration is experienced by the citizens as an unfavorable balance of power. The service is perceived as a favor rather than a right, which often results not only in a lack of accountability and responsiveness but also in a free interpretation of the texts and procedures that govern the service (CESE 2013).

In order to improve governance, public administration reform is viewed as a core component for sustained national growth and societal development. Conversely, the initiated reforms in the public sector in Morocco seem to have failed to achieve their objectives. As identified by Robinson (2015), political obstacles, and lack of capacity for implementation, are key explanatory factors in developing countries, in addition to focusing the public sector reform on structural and organizational reforms located within the old public administration paradigm. The new public management ideas seem also to be influential in the process of public sector reform, but more so at the level of rhetoric than practice (Polidano 1999). Moreover, by acting in the interest of the state and themselves, rather than in the general public interest they are supposed to represent and serve, civil servants are perceived by Moroccans as being "makhzenisés" (Silverstein 2011). Therefore, the practice of public administration in Morocco is still far from the New Public Governance approach and its public service ethos.

## Conclusion

Despite some undertaken initiatives seeking public reforms under the NPM paradigm, the public administration framework in Morocco seems to remain anchored in the old and traditional model with top-down reforms and the preponderance of control, over the logic of truly serving the common interest and effective participation of citizens. A gap between the rhetoric of reform and its reality is noticeable. The transition to the New Public Governance approach will require a bottom-up push by political parties and civil society to restore the balance of power and to effectively strengthen human rights, democracy, good governance, and economic transparency and fiercely fight the endemic corruption in the administrative system. The government needs to ensure that "public sector reforms are grounded in the interests and needs of citizens rather than driven by the technocratic impetus of public officials or the self-interested imperatives of politicians" (Robinson 2015). Protests have diminished since their apogee in 2011, with the sparkle of the Arab Spring leading to regional political unrest. However, the latent discontent and sporadic demonstrations continue over economic and social grievances, while some continue to call for deeper political changes (Bozonnet 2015). The recent Hirak movement, triggered in the Rif, is an alarming and revealing signal. Slogans used in the protests were openly denouncing the Makhzen's rampant corruption, poor governance, and outright appropriation of the nation's resources (El Malki 2017). The need to improve governance and public administration and to enhance the state's capacity to carry out new functions and roles is now widely recognized. The United Nations Millennium Declaration calls for respect for human rights and the promotion of democracy and good governance, emphasizing efficient and effective public administration

(UN 2007). Therefore, there is an urgent need in the kingdom of Morocco to raise awareness and promote a culture of accountability, transparency, and rule of law among civil servants and government authorities. Furthermore, there is a pressing necessity to place citizens at the center of public sector reform initiatives and to align the rhetoric with the reality of a new public governance.

# Public Administration in Russia, Digital Transformation

Igor Bartsits
Institute of Public Administration and Civil Services, Russian Presidential Academy of National Economy and Public Administration, Moscow, Russian Federation

## Synonyms

Digital Government; e-Government; Electronic Government

## Definition

Electronic government (e-government) is a mode of operation of government organs that is based on extensive use of information and communication technology (ICT) and is intended to step up the speed and convenience of access to public services and information concerning the activities of public authorities. Key objectives of e-government include: improving the quality and availability of public services for organizations and individuals; expediting the delivery of public services and simplifying the related procedures; reducing the administrative fees paid by organizations and individuals receiving public services; increasing the openness and accessibility of information concerning the activities of public authorities; and enabling direct engagement of organizations, individuals, and civil society institutions in the procedures related to making and reviewing decisions at all levels of government [comment on Federal Law N 8-FZ of 9 February 2009 "On Granting Access to Information Concerning the Activities of Government and Local Self-Government Organs," 2010].

Analysis of international experience of electronic government development and implementation reveals a broader interpretation of this concept, which includes elements of electronic democracy ("Electronic Justice," "Electronic Voting," etc.), with subsequent introduction of broader concepts (e.g., "Digital Government," "Digital Public Administration," etc.)

## Introduction

Digitalization and digital transformation have become a global trend and a source of large-scale changes in virtually all industries and fields of activity. At the same time, the accelerating migration of cultural, political, economic, and other activities to the digital domain not only opens new opportunities, but also poses risks, such as aggravation of the existing problems of social inequality and exclusion; fraud; threats to security, privacy, and personal data protection; lack of balance of power, etc. (Janowski 2015).

Although it is obvious that governments and individual government officials should have a way to monitor changes and control digital space, it is important to understand how key government functions, such as delivery of public services, design and implementation of state policy, maintenance of public order and safety, implementation of social programs, facilitation of economic growth, etc., should be implemented in the physical and digital world.

No doubt, evolving landscape of digital interaction changes citizens' expectations of public authorities and the nature of relations between them shifting the focus toward partnership and joint identification of citizens' needs. However, it is not enough to equip public authorities with digital technology. The objective is to make sure that they use it in a knowledgeable manner for the purposes of public and municipal administration and to make decisions based on real-time data rather than unclear personal or political interests or ambitions. The structure of the public sector, its workflows, transactions, and methods of administration are gradually adapting to the rapidly developing digital environment giving rise to concepts such as "Electronic Government," "Digital Government," "Data-Driven Governance," and many others.

Many of these terms are used in existing digital government initiatives implemented all over the world, as well as in studies and other publications

summarizing the experience of and lessons drawn from such initiatives.

## Experience of E-Government Building and Digital Transformation of Public Administration

Since the early 1990s, online public services have been influencing New Public Management as one of the models of public administration. After 2000, this trend became increasingly fast. At the early stage of digital technology evolution (first computers and information and communication systems), governments often assumed the role of a leader in implementation of new systems and applications; however, this did not translate into digital transformation of the system of public administration. According to Patrick Dunleavy, at the initial stage of introduction into public administration processes, digital technology did not play any significant role (Dunleavy and Margetts 2013).

In fact, IT operations were outsourced to agencies and IT companies leaving no room for technology in public administration. A distinctive feature of the Internet as a factor of transformation is its fundamental impact on various aspects of relationship between public authorities, individuals and nongovernment organizations. The expansion of the Internet not only produces technology-related effects, but also causes a wide range of behavioral, cognitive, organizational, political, and cultural changes related to a digital revolution. Thus, the Internet and mobile communication technology made possible joint production and joint provision of public services on a scale that could not have been predicted by the founders of the concept of public administration in the 1970s (Dunleavy and Margetts 2015).

The influence of the Internet-based technology on public administration has two dimensions: individual and collective. In the first case, it leads to isocratic administration where all citizens manage public services in the same way they use online banking services. In the second case, citizens jointly create public services and use the government as a platform for new ideas (the Government-as-a-Platform concept) in order to jointly design public policies. However, even though the culture and the system of values of the Internet have significant influence on the internal organization of the government, the digital environment of government organs is in many ways inconsistent with that of the citizens (Dunleavy and Margetts 2013). It is in this context that the Digital Era Governance (DEG) model emerged in the mid-2000s manifesting itself as complex of changes in public administration due to improved processing of information and fast "multi-sectoral" spread of information technology.

The DEG has three key components:

- Reintegration – core capabilities of the digital government are in unification of the diverse approaches of the state, society, and enterprises to provide individuals and businesses with user-friendly packages of public services.
- Needs-based holism in public administration or transition from the so-called "joined-up government" to simplification and further modification of the links between public authorities and society, and integration of all components of public and municipal administration to provide services to individuals and businesses through a "single window."
- Digitalization of government organs.

This model comprises three types of public administration transformation: first, internal organizational and economic changes within government authorities; second, civil and customer-oriented changes of the system of public service (holism and holistic approach); and, third, social and cultural changes caused by adoption of new technology.

This model also relies on citizens' feedback and takes it into account the delivering of public services, thus, making top-down administration inefficient. Such processes are integrated into each and every pillar of the system allowing citizens to create public services in an efficient manner. The UK achieved major progress in implementation of such processes in public administration thanks to its behavioral research team. Singapore is also trying to catch up with the UK (Dunleavy et al. 2006).

The growing need of reintegration can also be explained by the austerity policy of governments in the developed states. These states, by default, consider single-window services and digital tools as a means of achieving better policy outcomes with fewer resources and also as a way to encourage citizens to manage their affairs on their own (Dunleavy and Margetts 2015).

The Digital Era Governance and the Essentially Digital Governance (EDGE) as its enhanced version are models of bureaucracy that eventually place technology in the core of organizational structure of government and public administration.

This system of public administration is associated with social changes in the same way as learning is associated with experience at the individual level. In essence, digital government is based on two pillars (Dunleavy and Margetts 2015). The first one is putting in place a framework for public service design and administration, including: free provision of public services, use of existing information, one-time action ("Do it Once"), competitive development of scalable services, and isocratic administration. The second pillar is about creating a legal framework for policy design and service delivery: comparing results versus processes, ensuring formal rights and real compensation, "maintaining obligations of the state", and learning by doing.

Further development of the EDGE model is limited to the Weber and New Public Management models that still dominate in practical governance (Cruz-Rubio 2015). Some governments, especially those of Anglo-Saxon countries, are striving to satisfy the needs of citizens who are "neck-deep" in the digital world and use social media and online forums not only as their main source of information, but also as a source more reliable than public administration in its current bureaucratic form.

Numerous studies of various UN agencies are also devoted to e-government and digital government. Thus, in 2014, experts of the Organization for Economic Cooperation and Development designed and the OECD Council officially adopted the Recommendation on Digital Government Strategies for member states. This Recommendation was the first international legal document concerning this matter and summarizing the experience of OECD recommendations implementation in related policy areas (OECD 2014). The document lists the principles to be followed implementing a digital government strategy. These principles include winning more public confidence through citizen engagement and open government; improving management technology for more efficient cooperation and better outcomes; creating a favorable environment for higher return on investment in digital technology.

Some years later, in 2016, the Organization of Economic Cooperation and Development issued another interesting document studying the transformational effect of digital government strategies on public services (OECD, 2016). The document identifies two important elements of a digital government environment. The first one is the nature of the chosen information and communication technology where digitalization provides for higher adoption of digital solutions, especially ICT solutions, for better information and data management with the focus on higher efficiency and effectiveness of service delivery. The government should use approaches that change ways of service delivery for the purpose of cost reduction, especially for the services that require person-to-person contacts. The second element is the services and actions of the state where the process of digitalization will play a significant role. The final destination of a transformation journey should be digital government allowing the state to make its actions and activities more socially valuable and to achieve serious modernization of the public sector with the focus on higher openness and transparency as well as better interaction between society and public authorities resulting in increased confidence in public authorities and officials. This is to be achieved through integration of digital technology and user preferences into the design of public services as well as into the goals of government policy (OECD 2017).

To summarize, there is no point to deny the importance of information and communication technology. It is the development of social media, other communication tools and technology innovation in general that gave an impetus to

modernization of public administration. Thus, the DEG and EDGE models, as well as OECD's FAST modes served as a foundation for the new Digital Government concept.

Igor Ponkin believes that the concept of Digital Government comprises the following ingredients: a set of "e-government" tools and approaches, a set of "e-democracy" tools and approaches, a set of "e-justice" tools and approaches, and a set of "e-voting" tools and approaches (Ponkin 2016).

Very interesting is the approach to digital government building presented in the report by the Center for Strategic Research entitled "The Government as a Platform" (Burov et al. 2018). It describes the new modern government as a compact government machine capable of agile decision-making and with no state organs that may be acting as intermediaries between the individuals and their data, which makes building individual development trajectories and resolving real-life situations more feasible.

However, such transformation is impossible in the current situation where paperwork prevails, individual departments create duplicating information systems, and no partnership between the citizen and government authorities exists. Changes are needed, but there is a serious problem, which lies in the system itself and as such freezes the current state of affairs for an indefinitely long period of time (Center for Strategic Research, 2018). The authors of the report propose as a solution to the existing issues a Greenfield scenario of digital transformation. This scenario means deep reorganization and reengineering of business processes with extensive application of digital tools as process execution mechanisms which will result in a significant improvement of process characteristics (shorter execution times, elimination of some groups of subprocesses, increased output, lower consumption of resources needed for process execution, etc.) and emergence of process qualities and properties (automated decision-making with no human intervention, etc.) (Dobroliubova et al. 2019).

Experts of the World Bank have come up with interesting recommendations on development of e-government in Russia (World Bank 2016). These recommendations were based on leading countries' best practices and took into account the findings of a preliminary assessment of the current state of Russia's e-government project. They included designing a new strategic framework for programs of transition to digital government underpinned by clearly articulated goals for reduction of administrative costs, improvement of public services for individuals and benefits from Russia-wide "digital inclusion." It was also recommended to define the goals and objectives of using information and communication technology in different industries, introduce measures intended to reduce the digital divide between the federal center and the regions, and develop a detailed transformation strategy for each government organ specifying their respective objectives and methods of administrative processes digitalization.

Thus, what we have seen recently in the global practice is digital transformation of the public sector, migration from electronic government to a full-fledged open and efficient digital government. Rapid and ubiquitous adoption of digital technology across the globe gives rise to innovative business models and introduces drastic changes into people's lives. Anytime access to online products and services in combination with growing user-friendliness and simplicity of digital services have made citizens more demanding of their interaction with public authorities and of the quality of public services. Government portals, in turn, no longer meet the new demands; new online platforms emerge to set links between the government, civil associations, political parties, public opinion centers, and mass media. This results in conceptualization of the modern movement for the introduction of information and communication technology into public administration and policy in the form of new ideologies of electronic government, electronic governance, digital government, etc.; we see how accents are shifting from "Governance to You" to "Governance with You" for effective cooperation between public servants and civil society in solving complex socioeconomic and political problems and challenges (Pankratov 2016). It appears that the concept of electronic government is developing toward higher complexity, contextualization, and

specialization similar to the evolutionary processes that change cultures and societies.

## Stages and Principles of E-Government Building in Russia

In 2000, the Russian Federation ratified the Okinawa Charter on Global Information Society and it is then that some ideas of electronic government were mentioned at the legislative level. The Charter emphasized, "Information and Communications Technology (IT) is one of the most potent forces in shaping the twenty-first century. Its revolutionary impact affects the way people live, learn and work and the way government interacts with civil society."

Later, Russia adopted a number of concepts (e.g., the Concept of Information Technology Use by Federal Authorities of the Russian Federation through 2010 (2004), the Concept of Electronic Government Building (2008) and the State Program of the Russian Federation "Information Society (2011–2020)" (2010)) and laws (e.g., Federal Law "On Personal Data Protection" (2006), Federal Law "On Delivery of Public and Municipal Services" (2010), etc.).

The active phase of e-government building in the Russian Federation is associated with the implementation of the State Program "Information Society (2011–2020)," which is aimed at:

- Improving the quality and availability of the public services provided to organizations and individuals; simplifying the procedure and reducing the time of service delivery; reducing the administrative costs incurred by citizens and organizations receiving public services; and introducing uniform standards of service delivery to individuals
- Ensuring openness and accessibility of information about the activities of public authorities; creating more opportunities for organizations, individuals and civil society institutions to directly participate in making and reviewing decisions at all levels of government
- Improving the quality of administrative and managerial processes
- Improving information and analytical support of decision making at all levels of government; ensuring efficient and thorough control over the performance of public authorities; and maintaining at the proper level information security of electronic government

The Strategy of Information Technology Sector Development in the Russian Federation in 2014–2020 and through 2025 approved by Order of the Government of the Russian Federation № 2036-р of 1 November 2013 emphasizes the importance of information systems. Thus, the Strategy document says that information technology helps deliver higher-quality public services and facilitates economic growth, which makes it an important tool of public administration. For this reason, the Russian state gives high priority to introducing information technology in key industries and developing technologies, stepping up the adoption of information technology by the public sector, and developing electronic services.

Another important document is the Concept of Development of Electronic Public and Municipal Services. This document emphasizes the role of various information and communication solutions, such as the Public Service Portal and the interdepartmental information systems, with the focus on the advantages of electronic services, including self-sufficiency and remote access.

The Strategy of Information Society Development in the Russian Federation in 2017–2030 identifies key principles of building information society, including: safeguarding citizens' right of access to information; granting freedom to choose the means of acquiring knowledge in working with information; giving priority to traditional Russian spiritual and moral values and encouraging behavior based on such values in using information and communication technology; ensuring public protection of the interests of Russian citizens in the information domain, etc.

The Strategy also defines terms, such as "Secure Software and Services," "Critical Infrastructure of the Russian Federation," "Critical Information Infrastructure Facilities," etc.

The said documents describe the prerequisites for and the goal, key focus areas, and priorities of electronic government building in the Russian Federation and define the activities and key performance indicators intended to enable the creation of e-government infrastructure.

The Strategy of Information Society Development is intended, in the first place, to serve national interests such as development of human potential; protection of citizens and the state; free, uninterruptable, and secure interaction between individuals and organizations, government authorities of the Russian Federation and local self-government authorities; higher efficiency of public administration; social and economic development; shaping of digital economy, etc.

To develop information society, the government needs to put in place an environment conducive to shaping a knowledge space and enabling access to this space, and improve mechanisms of knowledge dissemination and putting into practice in the interests of individuals, society, and the state.

The Strategy underscores the need to standardize approaches to government regulation and gradually migrate government authorities and local self-government organs to the electronic government infrastructure that is part of Russia's information infrastructure.

The measures included in the Strategy are expected to ensure effective use of electronic tools by public servants. Moreover, such effective use is not a right, but a duty of each and every official at all levels of public service. In turn, electronic data channels can grant citizens true access to information about public service.

It is worth mentioning that, in 2014, the Government of Russia launched a program named "Bridging the Digital Divide" – the objectives of the program are defined by Federal Law "On Communications." Under this program, users of access points get free access to 2,000 websites including websites of government organs, a portal of public and municipal services, and online media that officially publish federal and constitutional laws, legislative acts, and other regulations issued by federal executive organs. Besides, in his Address to the Federal Assembly of the Russian Federation of 15 January 2020, President of Russia Vladimir Putin proposed getting down to the preparation and implementation of the "Affordable Internet" project. This project is intended to provide nationwide free access to essential domestic Internet services, including the Portal of Public Services, as well as to the websites of federal and regional organs of power. It is expected that the "highly affordable Internet will give Russia and its citizens a competitive advantage and create bigger opportunities for education and creative activities, networking and implementation of social and cultural projects" (Putin 2020).

Decree of the President of the Russian Federation № 474 of 21 July 2020 "On National Development Goals of the Russian Federation through 2030" underscores the importance of digital transformation of public administration and defines as one of the priorities achieving "digital maturity" in key sectors of the economy and social sphere, including healthcare and education, as well as public administration.

Pursuant to this Decree, 4 June 2019, the Government of the Russian Federation designed the National Project "Digital Economy of the Russian Federation." An important part of this Project is the Federal Project "Digital Government." This Project is intended to accelerate the introduction of digital technology into the economy, social sphere, public administration, and public services. Implementation of the "Digital Government" Project will complete the transition to electronic interaction between individuals, organizations, and the state, and will make this interaction more convenient for individuals and organizations.

Thus, a register model, exterritoriality, and proactive delivery of electronic public and municipal services will be implemented. There will also be put in place individual/organization feedback mechanisms, and legally binding document exchange will become predominantly electronic. At the same time, the government authorities and organs of local self-government will have at their disposal efficient automation tools and interagency information exchange solutions.

In the period between 2019 and 2024, in the context of the National Project "Digital Economy" and the National Projects "Digital Government" and "National Security" as its integral parts, the following activities will be completed: design and launch of the National Information System "Federal Portal of Spatial Data"; development of national standards for big data processing; introduction into practice of federal and regional executive authorities of electronic interdepartmental document exchange with the use of digital signature; launch of a network of situational centers of supreme organs of state power; introduction of the electronic passport of a citizen of the Russian Federation, etc.

At the same time, in spite of a large number of e-government laws and regulations, the legal framework of electronic government is still incomplete and inconsistent. Many legal acts initially designed for a short period of time are still in effect while some of them are intended to serve as response measures filling the gaps caused by inefficiency, erroneousness, or inaccuracy of some other instruments. For this reason, some experts find it necessary to review all existing laws and regulations to elaborate a new strategy capable of meeting the global trends and the current domestic situation.

## Institutional Structure of Electronic Government and Super-Services

In the Russian Federation, the institutional structure of electronic government mirrors the country's multiple-tier system of government and local self-government and includes the federal tier, the regional tier, and the local tier. In charge of e-government development in Russia is the Ministry of Digital Development, Communications and Mass Media of the Russian Federation. Key focus areas of the Ministry are:

- Information-driven government, namely, introduction of information technology at the level of government authorities and at the level of Russian regions; implementation of digital transformation projects in healthcare, education and voting
- Electronic government, more specifically e-government infrastructure, e-services for individuals and businesses, super-services and digital transformation of public services, etc.
- Development of the IT sector, including putting in place a favorable environment for IT businesses; development of talent capacity, etc.
- Digital economy – e.g., talents for digital economy, information infrastructure, information security, digital technology, and digital government

The last focus area is about providing individuals and organizations with online access to most critical public services, creating a national data management system, developing electronic government infrastructure and introducing end-to-end platform solutions into public administration.

By 2024, it is planned to achieve the following:

- Proactive online delivery of public (municipal) services
- Automation of 90% of departmental and interdepartmental legally binding document exchange of government and municipal authorities and public sector organizations
- Providing 60% of citizens with digital IDs with a qualified electronic signature

In 2013, the *Government Commission for Digital Development and Improvement of the Quality of Life and Business Environment through the Use of Information Technology* was established in order to coordinate government authorities' activities related to the promotion of IT. Acting as a coordinating body, this Commission enables interaction between federal executive authorities and executive authorities of constituent entities of the Russian Federation engaged in the development of digital economy and promotion of information and communication technology as a means of shaping information society and electronic government.

This body comprises several subcommissions, namely, the Sub-Commission for

Public Services, which specializes in using information technology to deliver public and municipal services, and the Council for Regional Informatization.

As a working body of the Government Commission, *the Council for Regional Informatization* coordinates all activities related to e-government development at the regional level and provides organizational and methodological support to facilitate interaction between constituent entities of the Russian Federation and federal executive authorities in matters of ICT use and development by regional executive authorities and their subordinate institutions and organizations. Members of the Council are 93 regional deputy governors whose scope of responsibilities includes informatization, regional IT and communications ministers, and directors of specialist departments of the Ministry of Communications of Russia.

It is necessary to note that local self-governments vary in terms of information and communication technology adoption rate.

## Russia's Central Portal of Public and Municipal Services

An important part of Russia's electronic government endeavor is the automated information system *"Federal Register of Public and Municipal Services (Functions)."* On 16 December 2009, the Central Portal of Public and Municipal Services was launched. The main purpose of the Portal is to enable transition to electronic delivery of public services. Currently, the Portal helps achieve the following goals:

- Increasing the share of individuals using public and municipal services electronically
- Improving the quality of public and municipal services through enhancing the Portal interface and mobile applications
- Simplifying the procedure of signing up for and receiving public services
- Enhancing the functionality of user accounts
- Enhancing the online payment functionality for duty and fee collection

The organizational framework of the Central Portal of Public and Municipal Services is the network of multifunctional service centers established in 2007. Since then, a lot has been done to make these centers and electronic service delivery more efficient, and this work continues. According to Resolution of the Government of the Russian Federation №1467 of 18 November 2019 "On Amending Provisions on the Federal Government Information System 'Central Portal of Public Services (Functions),'" new Portal services were launched to enable:

- Creation of a "single digital window" to submit proposals, applications and complains to public authorities and local self-governments as well as their subordinate organizations
- Proactive delivery of public and municipal services by inviting all those registered in the unified identification and authentication system to apply for public and municipal services they are entitled to
- Completion of legally binding actions, including making deals, in an electronic format

The Ministry of Digital Development, Communications and Mass Media of the Russian Federation is also tasked with putting in place 25 proactive online super-services, which must be delivered without human intervention, including delivering government support to businesses, making electronic employment contracts, applying for university admissions, issuing digital academic credentials, registration of businesses, etc.

The number of users of the Central Portal of Public and Municipal Services increased from 65 M in 2017 to 86 M in 2018 and 103 M in 2019. In 2018, the traffic of the Portal grew by 30% + and reached 582 M visits. On average, 1.6 M users visited www.gosuslugi.ru on a daily basis. All in all, in 2018, Portal users filled out and submitted over 60 M electronic applications for public services, which is 55% more that in 2017. The most popular service proved to be the request for account information from the Pension Fund of Russia – users sent 16 M+ such requests. Second, in terms of popularity, was vehicle registration – this service was used 4.8 M times. There came

about 3 M passport and property registration applications. About 2.6 M users applied for driver's license renewal. In 2019, users ordered more than 152 M services of which the biggest share – almost 63 M applications – belonged to medical appointments.

According to Similarweb, the Russian Portal is the second most visited in the Law and Government category; in 2019 the "Gosuslugi" (Public Services) mobile app won the 6th annual Best m-Government Service Award in the "Accessible Government" nomination. A number of Russian regions also engaged in creating similar infrastructure, including regional public services portals, which are highly demanded by their residents.

Although, in the recent years, Russia achieved a significant progress in electronic government building, the utilization rate of many electronic services is still relatively low. Not always are achievements in technology underpinned by proper changes of the legal framework or administrative regulations. Interoperability solutions did improve the efficiency of interdepartmental interaction; however, they failed to make electronic services more user-friendly; internal administrative processes are still not digital enough (the World Bank 2016).

## Russia's International Ratings

The E-Government Development Index (EGDI) shows countries' preparedness for implementation and use of electronic government services. The EGDI is a composite index comprising three subindices: the Online Services Index (OSI), the Telecommunication Infrastructure Index (TII), and the Human Capital Index (HCI). All three have the same weight and cover a wide range of themes that are relevant for electronic government. In 2008, Russia demonstrated pretty poor results (60th place with a score of 0.512 points); then made a serious progress in 2012 (27th place with 0.7345 points); and then rated 35th in 2016. In 2018, the Russian Federation rated 32nd with a score of 0.7969 and joined the group of countries with a very high index value. (Sidorenko et al. 2019).

In 2018, Russia improved its E-Participation score and moved up – from the 34th to the 23rd place – in the rating of countries with the highest level of digital citizens engagement. This index is designed to rate countries based on their citizens' engagement in the process of policy making with the use of information and communication technology. Clearly, the abovementioned results are based on analysis of data from all regions. However, the level of digitalization in the capital cities – Moscow and St. Petersburg – and in other major cities of Russia is much higher. According to the same study, Moscow is not just one of the cities with a "very high level" of development of e-government services, but Number One: Moscow has 55 of the 60 well-developed e-government indicators, which is the world's highest score (Paris, Sidney and Amsterdam scored 51, 50, and 49, respectively).

In 2017, the Russian Federation ranked 45th of 176 countries and scored 7.07 in the ICT Development Index – a composite index combining three groups of indicators: ICT access, ICT use, and ICT Skills.

Another important characteristic of information society is information security. In 2018, Russia ranked 26th in the Global Cybersecurity Index with a score of 0.836. On the one hand, the country stepped ten lines down compared to its 2017 ranking (10th place with a score of 0.788), while, on the other hand, it managed to improve in many ways, namely, it received additional points for upgrading its cybersecurity legislation, improving its technology infrastructure and capacity building, professional training, and public awareness.

Indeed, Russia pays much attention to the use of information technology in public administration. It is deploying a new end-to-end architecture capable of reducing tension, eliminating the gap between government authorities and technology savvy businesses and individuals who are becoming increasingly demanding and sensitive to the quality of services.

## Conclusion

In the recent years, Russia laid a high-quality foundation for electronic government, and developed and launched key elements of its national infrastructure (Central Portal of Public and

Municipal Services; unified system of interdepartmental electronic interaction; national distributed data processing platform; a unified identification and authentication system enabling integration of information systems supporting delivery of electronic public and municipal services; and information system of the central certification authority).

Both government authorities and major expert fora, such as the St. Petersburg Economic Forum and the Gaidar Forum (2018, 2019, and 2020) confirm the need for engaging in full-fledged digitalization and moving to the next phase in transforming Russia's system of public administration and public services – i.e., the phase of electronic government building. This implies full digitalization of services, from application to delivery, as well as making sure that all administrative processes are predominantly data-driven rather than document based. In the digital era, the key objectives of the Russian Federation should include:

- Development of infrastructure, including competitive telecommunication provider's markets, access to telecommunication services in hard-to-reach areas, and transparency of the system of intellectual property rights
- Development of education (access to online education, financial assistance to schools and universities, and upgrading of curriculum standards)
- Development of fundamental studies, including R&D financing, investment in projects, participation in international research, and experience sharing
- Platform building, e.g., for centralized access to universal public services, agile and simple document exchange, and smart data processing (Pankratov et al. 2018.

According to experts, key focus areas of digital transformation of Russia's public administration system will be the following:

- Changing the system of public administration and public services, and reallocating the functions of government and municipal authorities
- Managing changes amid legal and regulatory risks created by the state itself
- Training digital transformation professionals
- Encouraging digital maturity of government authorities

An important aspect of information technology introduction into public administration is improving awareness of businesses and civil society institutions of available public and municipal services and respective administrative requirements.

## Synonyms

Evolution of public administration in Russia; System of public administration in Russia

## Definition

The history of public administration in Russia tracks the emergence, development, and changes of Russia's forms of government over various historical periods.

Depending on the chosen theoretical model of analysis, one can define the fundamental phases of the development of the public administration system either on the basis of chronological methods or by analyzing the forms of government (the system of government bodies, the principles of their inter-relationship, the separation of powers), and the state structure (administrative structure and regional management) and the political regime (Mukhaev 2019; Pikhoya 2009).

## Introduction

The following main phases are traditionally outlined in the history of public administration in Russia:

- Ancient Rus (ninth to fourteenth century) is characterized by the formation of a feudal state with a government system based on the vassal/suzerain relationship.
- The common Russian state (fourteenth to seventeenth century) when a centralized state is being formed by way of unification of apanage principalities under Moscow's leadership and structuring unified government bodies.
- The Russian Empire (beginning of the eighteenth century to 1917) where an administrative system is formed based on the Emperor's sovereign authority. The principles of government are expressed in a concentrated form in the theory of "official nationality" and unofficial slogan "Orthodoxy. Autocracy. Nationality."
- Soviet Russia (October 1917–December 1991) is characterized by the socialist (usually referred to as Communist) regime based on the principle of fully empowered Soviets (Councils of People's Deputies) and Communist ideology. From 1922 onwards the Russian statehood developed in the form of the Union of Soviet Socialist Republics.
- The present-day phase of public administration (from 1992 to the present time) representing the formation of a public administration system based on the principles of separation of powers, sovereign democracy, human rights, and civil liberties. The Russian statehood exists in the form of the Russian Federation.

## The Period of Ancient Rus (Ninth to Fourteenth Century)

The state of Ancient Rus, which emerged in the ninth century and ultimately formed at the turn of the tenth and eleventh centuries, was a typical early feudal monarchy. The state was headed by the Grand Prince, who originally combined the political (legislation, foreign policy, government

administration, judiciary, etc.), military and sacred power (beginning with the Christianization of Rus in 988 the religious authority belongs to the Church). The government administration at the time was not differentiated among branches and institutions.

Originally the prince carried out his various (predominantly managerial) duties together with his druzhina/retinue (ninth to tenth cc). Beginning with the second half of the eleventh century, feudal assemblies (Snem, Council of Princes) were held to take decisions on the most important issues of the state and its management. The princely council (druzhina members, boyars, elders) decided the issues of internal government administration, taxes, foreign policy. The Kiev Veche (assembly) and Veche-type conventions at the centers of local principalities continued to be influential for supreme authorities.

With the formation of the princely domain the previous, quasi-military system of governing by leaders of "tens," "hundreds," and "thousands" which was characteristic of tribal society, a new system of central government made of the court and patrimonies, was being formed. It was headed by the *tiun* "of the fireplace" who managed the princely court, the household, and the finances. A whole staff of *tiuns* (key-keepers, cup-bearers, horse-keepers, falconers, etc.) each in charge of a specific aspect of the estate management, reported to him.

*Posadniks* appointed by the Grand Prince of Kiev in the cities and *volostels* appointed in rural areas carried out local administration, tribute collection, and adjudication. They formed the system of *kormlenie* (i.e., "feeding," that is, keeping officials at the expense of those they governed) which functioned up to the sixteenth century.

A special system of government emerged in the north-western part of the ancient Russian state, where feudal republics of Novgorod and Pskov were formed in the eleventh and twelfth centuries. The supreme authority there was *veche*, i.e., the convention of the owners of the city properties which was assembled from time to time. Veche decided the main issues of the republic, including the election of the prince, and concluded a treaty with him.

When most of the Russian lands were taken over in the thirteenth century by the Mongol troops, also known as the Tatar-Mongols, Rus became a vassal and tributary of the Golden Horde. The ultimate liberation from the Tatar-Mongol yoke took place in 1480.

## The Period of the Centralized Russian State, or Muscovy (Fourteenth to Seventeenth Century)

At the end of the fifteenth century, the lengthy process of unification of the Russian lands under the authority of the Principality of Moscow was completed, and a united Moscow state emerged. From then on, a centralized government administration system started to take shape.

The supreme authority belonged to the Grand Prince of Moscow (since 1547 – Tsar). However, he shared the administration of the country with the Zemsky Sobor, or the Assembly of the Lands, and the Boyar Duma, or Council of the Boyars, which is characteristic of the estate-representative monarchy. For more than a century the Assemblies of the Lands (assemblies of the representatives of the boyars, clergy and other estates) took part in carrying out a series of important reforms (military, financial, administrative, and others) in the second half of the sixteenth and first half of the seventeenth century.

The Boyar Duma which had a diverse competency (law making, administration, and judicature) and consisted of former appanage princes, boyars, and Duma officials, carried out a series of powers in the field of administration, usually together with the Tsar. It coordinated the activities of the Prikaz (offices), levied taxes, resolved property disputes, organized the military, supervised local administrations, etc.

As an indicator of this centralization, the Prikaz offices formed in the first half of the sixteenth century as the central bodies. In the seventeenth century, their number grew to 80 and included the offices in charge of specific branches, such as the Ambassadorial and Post (Transport) Prikaz, the Prikaz in charge of military affairs (Artillery, Streltsy (Infantry), Munition, etc.),

territorial Prikaz (Siberian, for Little Russia, etc.), palace Prikaz (Grand Palace, Stables, Beds), and financial Prikaz (Big Treasury, Monetary Collection, Big almost entirely alienated from fulfilling Income, etc.)

A reform was carried out in the 1530s and 1540s. Thanks to this reform, instead of the kormlenie system, local government of the lands emerged. And in the first quarter of the seventeenth century, it came to *voivoda* administration system – that is, of regional governors.

## The Period of the Russian Empire and the First Republic (From End of the Seventeenth to the Beginning of the Twentieth Century)

Both central and local government systems at the beginning of the eighteenth century failed to discharge the vestiges of the political forms dating back to the previous stage of the state's development (estate monarchy) and did not quite satisfy the demands of the tsars as far as translation of their will into the behavior of their subjects was concerned.

For instance, the central general competence body, the Boyar Duma, continued to be formed on the bases of the estate principle and thus kept the relicts of the *mestnichestvo* system (in which government posts were filled according to the ancestry) and traditions of boyar separatism. The Boyar Duma did not have a clearly defined competence, its activity was practically unregulated. The cumbersome and nontransparent Prikaz system was also very difficult to manage. There was no consistent principle for Prikaz to function and how they were allotted competencies. A whole number of identical judicial, fiscal, and administrative Prikaz existed parallel to each other and created difficulties in delimiting their competencies and dividing those responsible for fulfilling the Tsar's orders. In addition to that, the territorial division of the country was too fractional, which, like in the Prikaz system, made it practically impossible to supervise local officials on a permanent basis.

The Tsar's government faced the necessity to transform the central and local government apparatus according to the new goals, first and foremost the goal of carrying out the absolute will of the monarch in all spheres of public life subject to the state's interference. The first decisive steps in this direction were undertaken in the beginning of the eighteenth century by Peter the Great (Seryogin and Larionov 2014).

In this regard, in 1699, the Blizhnaya (Intimate) Chancery was established, formally within the framework of the Boyar Duma, and aimed at controlling the debit and credit of all the Prikaz. However, very soon its powers were substantially expanded. It was in the offices of this Chancery that rare meetings of the Boyar Duma started to take place, with the participation of the Prikaz heads (since 1704), a new consultative body was formed – *Concilia* of ministers (1708), which was empowered to discuss the most important issues of government. Quite often the *Concilia* assumed the authority of the supreme government body (mainly during the Tsar's many trips). When the *Concilia* emerged, the Boyar Duma eventually stopped being convened at all. As a final phase of the *Concilia's* functioning one can see the establishment of a new general central government body of general competence – the Senate.

Another instrument of strengthening the monarch's power was the Cabinet of Peter the Great, which was established as his private chancery and mentioned for the first time in 1704. The Cabinet traveled with the Tsar during his military campaign and other trips and received military and financial documents. Orders and replies were also generated there. Eventually the Cabinet expanded its powers – it had to carry out an extensive correspondence with various state and public structures, such as the Russian envoys abroad, governors, vice-governors, having to do with mines and manufactures, such as issuing privileges, state-owned factories, their staff, etc. The majority of petitions, complains and denouncements were processed in the Cabinet. And only denouncements regarding treason, cases against the health of the Sovereign and against the state interest fell within the competence of the Preobrazhensky Prikaz and later – the Privy Chancery (Eroshkin, 1968).

The first reform of Peter the Great which outlived its initiator was the consolidation of the administrative structure of the country. The Decree on the establishment of *guberniyas* (large territorial units) and allocation of cities to them was issued on Dec. 18, 1708. Altogether 8 *guberniyas* were established. The system had no relation to the size of the territory of the population. As a result it was very difficult to establish a uniform government machinery that would fit the guberniya management. At the head of the apparatus stood the governor appointed by the Tsar and relying on the chanceries.

The reform of the administrative structure continued on May 28, 1719 by establishment of the new administrative territorial unit – *provinziya* (province). The provincial structure was somewhat more consolidated that those of the *uyezds*, but was essentially similar. At the head of the *provinziya* apparatus, like in an *uyezd*, stood a *voivoda*, whose post was later renamed into a *komendant*. A chancery reported to him.

The consolidation of the administrative structure together with the restructuring of other elements of the state apparatus undoubtedly improved the ties between the central government and the territories. However, a lack of uniformity and weakness of content of this structure led eventually to it requiring further reforms.

The Decree of Dec. 12, 1718 marks the beginning of the radical reforms in the field of central sectoral, or specialized, administration. The contradictory and chaotic system of Prikaz was replaced by a system of 9 *Collegia.* Later other specialized bodies with the powers similar to those of the *Collegia*, were created, such as the Religious Collegium (Holy Governing Synod) and the Main Magistrate. The *Collegia* system substantially simplified and unified the sectoral administration as well as introduced a new system of organization and principles of activities for central sectoral bodies.

Compared to the Prikaz system, it was a major leap forward: the structure and activity of a Collegium were standardized and thoroughly prescribed. However, the very course of collegial decision-making did not quite correspond to the hierarchy of government bodies and officials, which was taking root in the government apparatus.

For a long time the functioning of a central general competence body remained an unresolved issue in the hierarchical system of the government apparatus. The Decree of Feb. 22, 1711 to establish the Governing Senate should be considered the beginning of this process. The Senate, which existed for more than 200 years (it was abolished by the Soviet Decree on Courts No. 1 on Nov. 22, 1917) was reformed regularly, acquiring and losing various powers, and evolved from a collective head of state in the absence of Tsar Peter to the top judicial body of the Empire. Even during the rule of Peter the Great it changed its composition and competence several times, often combining them with the functions of a supreme oversight body. The Governing Senate acquired its fullest legal regulation on April 27th 1722, when the Decree "On the Office of the Senate" was issued.

The Senate found itself at the top of the hierarchy of state bodies, which were inferior to the Emperor, that's why its decisions could not be independent, not in connection with the will of the sovereign. Besides that, the Emperor retained the right to control the activities of the Senate. Such control was fulfilled through the strictest written record keeping and supervising officials.

The oversight functions in the Senate were historically carried out by two types of officials. To carry out covert oversight over the activities of the state bodies, Peter the Great established in 1711 the office of *Ober-Fiscal*. By Decree of March 17th, 1714 the *fiscal* system was promulgated throughout the territory of the country. On Jan. 12, 1722 the oversight system was strengthened by establishment of the Procurator's Office. This decree introduced the offices of Procurator General and Ober-Procurator in the Senate, as well as the offices of Procurators in each of the Collegia. By Decree of Jan. 18, 1722 the offices of Procurators were introduced in the first and second instance courts (Hofgericht), which expanded the system of procurators throughout the territory of the country. Finally, the activity of the Procurator's Office was regulated in the most detailed way by the Decree of April 27, 1722 "On the Office of Procurator General."

The duty of procurators at all levels was to monitor the exact implementation of the Tsar's will, expressed in the normative and individual legal acts issued by him, as well as in the acts of all lower government bodies according to their hierarchy. One can see Peter's assumption of the title of Emperor on Oct. 22, 1722 as a certain type of symbolic conclusion of his reform of our country's government apparatus, which emphasized his absolute superiority within the country as well as independence and equal status among all European monarchs as far as the external relations were concerned.

It is true that after Petrine reforms, Russia's government apparatus went through substantial changes and represented a relatively harmonious hierarchy of government bodies and officials headed by the Emperor. The government system was based on completely new principles of public service career and acted in a strict bureaucratic way. The activities of officials were prescribed by the Emperor in a detailed way with the help of two main normative acts: "The General Procedure" (Generalny Reglament) issued on Feb. 28, 1720, and the "Table of Ranks" confirmed on Jan. 24, 1722.

The new government apparatus was under strict control of the specialized bodies – fiscals and procurators – which was meant to rule out an arbitrary use of their powers by officials disregarding the will of the Tsar. In this way, the system of state authority organization was adjusted in order to implement the monarch's will in the behavior of the subjects.

In the following period of coups d'etat there appeared, often for a brief period of time, supreme state institutions which had, alongside the others, also management functions. Such were the Supreme Privy Council, the Cabinet of Ministers, the Conference (and then Council) of the Supreme Court, the Imperial Council.

In order to strengthen the ties between the central authority and local government bodies, as well as to strengthen control of her subjects, Catherine the Great carried out a whole series of administrative and estate reforms, which substantially changed the administrative structure of the country. The issuance on Nov. 7, 1755 of the Constitution for the Management of the Guberniyas of the All-Russian Empire (Uchrezhdeniye dlya upravlenia gubernii Vserossiiskoi imperii) became the first step in this direction. In order to organize local government bodies, the territory of the country was divided, according to the number of its population, into *guberniyas* or *namestnichestvos*, which, in turn, were divided into *uyezds* or *okrugs.*

The government apparatus of a guberniya or namestnichestvo had a dual structure. The lower level consisted of the Upper Court of Lands (Verkhnii zemskii sud), Upper Council (Verkhnaya Rasprava), the Guberniya Magistrate, and the Court of Conscience (Sovestny Sud). The upper level of a guberniya or namestnichestvo apparatus was the Board (Pravleniye) headed by the Governor or Namestnik.

The Board was in charge all financial, economic, social and police affairs of a guberniya (namestnichestvo). Please note that many offices of the uyezd and gubernia government apparatus were elected, although the election took place within a certain estate of the realm. They were elected by the respective estate for a fixed period of 3 years.

The reformed government apparatus of the empire after the administrative reform of 1775 better satisfied the demands of the central authority to control the population of the country. By far and large it ran in this shape and form up until the Great reforms of the 1860s and 1870s.

The administrative structure and composition of the estates of the Russian Empire the way it was ultimately formed during the reign of Catherine the Great allowed to project the unlimited power of the monarch to all the subjects. Their minority – nobility – served as the administrative and armed base of the regime, set against and controlling the absolute majority (urban population and peasantry), who created all the material wealth while being almost entirely alienated from fulfilling the state powers.

The administrative (1775) and police (1782) reforms cemented the territory of the country with a network of government bodies, whose activity required sectoral coordination and management. And while the sectoral dimension was

regulated by the Collegia which had been established long ago by Peter the Great, the coordination among the sectors was virtually non-existent.

The next wide-ranging reform of the central government apparatus began on Sept. 8, 1802, when the Manifesto on establishment of ministries was made public. Instead of the Collegia, Russia now had eight ministries as the central sectoral administration bodies. The ministerial reform continued in 1810–1811. The competence of each ministry and main directorate were defined in the Manifesto On the Division of the Affiars of the State Among the Ministries of Aug. 17, 1810. Finally, in the most detailed way the composition of the ministries, their competences as well as the process of setting up and activity of the ministries was fixed in the Manifesto On the General Establishment of Ministries of June 25, 1811. This phase of reform was initiated by Mikhail Speransky. He used not only the experience of 8 years of work of the Russian ministries, but also the tested organization of the ministries of Napoleon's France (Eroshkin, 1968). On March 20, 1812, right before departing for the army in the field, Alexander I established a separate government body – the Committee of Ministers, which completed the formation of the central general competence body.

The rule of Tsar Alexander I is also tied to the regulation of the government's legislative activity. On Jan. 1, 1810 the Emperor established a special quasi-legislative body – the State Council. Every department of the State Council was in charge of its own area or legislation, but the Article III of the Manifesto of Jan. 1, 1810 clearly said that no law or another normative act should proceed from the Council and have legal force without the Emperor's approval. However, a rule was established, according to which every law had to be necessarily discussed in the State Council before it was approved by the Emperor.

The reforms of the central government at the beginning of the nineteenth century by far and large shaped it in a more logical form characteristic of a hierarchical system. It became to look more at least slightly similar to a modern administrative top down command system. The sectoral management was based on the principle of undivided authority behind a central general competence body made up partially from the heads of sectoral bodies, which allowed it to play a coordination role.

While the system of separation of powers did not exist, the legislative activity was delineated within the central government apparatus, although it was not isolated and was in fact connected with sectoral management. The government apparatus was run by a supreme body which concentrated the full state power and controlled all the inferior bodies.

The ascent to the throne of Alexander's successor, Emperor Nicholas I was marred by the uprising on Dec. 14, 1825 and forced the Emperor to reinforce the political component of the government apparatus. Nicholas I managed to strengthen the state apparatus, complete the work to systematize the body of law – something that none of his predecessors from the eighteenth century onwards had managed to do. The latter gave a strong push to improving the work of the entire government machinery.

On July 3, 1826, the Emperor issued a Decree "On the Incorporation of the Special Chancery of the Ministry of Interior to His Majesty's Personal Chancery" which established the so-called Third Section. The Emperor's Chancery had been created by Peter the Great as an auxiliary body, which prepared cases for the Emperor's personal decision, and later completed the paperwork on them. This body got transformed, adjusting itself to the needs of any Emperor. However, during the rule of Nicholas I it acquired a special meaning as an institution that stood above the ministries.

Playing the role of a certain middleman between the Emperor and the ministries, the Personal Chancery often replaced the sectoral government bodies and inter-sectoral bodies and thus appeared to be a superfluous element in the government apparatus, which made a path from a study of a case to a decision only longer. However, the Third Section of the Chancery together with the Special Gendarme Corps, which de facto turned into a separate body of political police, became an effective instrument to fight radical political movements and provided a physical

backing to the reactionary policies of Nicholas I (Seryogin and Larionov, 2014).

The growing revolutionary situation in Russia when reforms began to be developed at the late 1850s required a transformation of the administrative part of the government apparatus. By that time the Committee of Ministers, which was overloaded with a mass of administrative cases, was de facto unable to coordinate the activities of various bodies and ministries. In order to fulfill this function, a new central body of general competence was created on Nov. 12, 1861: the Council of Ministers. It consisted of ministers, glavnouprav-layushchie, chairmen of the Committee of Ministers and State Council and a number of people close to the Emperor. The Emperor Himself was the chairman of the Council of Ministers and had the right to put all issues on the Council's agenda. Unlike the Committee of Ministers, whose competence continued to include current administrative affairs, the Council of ministers concentrated on considering and discussing the issues that were relevant and important for the entire country.

As the "Great Reforms" progressed and the administrative apparatus in Russia became stronger, the role of the Council of Ministers began to decrease. In 1870s, its sessions were convened very rarely, and since Dec. 11/|23 1882 stopped altogether (Eroshkin 2014, p. 201). As far as the Committee of Ministers is concerned, it continued its managerial activity as a coordinator of the ministers' activities.

## The Organization of the Public Administration in the Russian Empire in the Beginning of the Twentieth Century

The revolutionary events of 1905–1907 have led to changes in the form of government in the Russian Empire. On October 17, 1905, under serious pressure from Prime Minister Sergei Vitte, Emperor Nicholas II signed the Manifesto "On the Improvement of State Order," which marked the beginning of the constitutional era in Russia. Nicholas II understood this. In his letter to his mother, dowager Empress Maria Feodorovna, he clearly said that the document that he had signed was "essentially the constitution".

The Manifesto of October 17, 1905, became an important step in Russia's transition from an absolute to a constitutional monarchy. On the basis of this Manifesto on December 11, 1905, an imperial decree introduced changes to the statutes on the elections to the State Duma, which was meant to expand the number of voters. On February 20, 1906, another Manifesto introduced changes to the formation of the State Council and State Duma. Based on this Manifesto, the State Council, which had existed since 1810, became the upper chamber of Russian Parliament, while the newly created State Duma became the lower chamber of parliament.

On April 23, 1906 Nicholas II approved the Code of the Fundamental Laws of the Russian Empire. Essentially it was the first Russian constitution. Albeit with very limited powers, a two-chamber parliament was being formed in Russia, that had not only representative and advisory, but also real legislative, financial, and even controlling powers. It marked a turn to the elements of the doctrine of separation of powers. Having fixed that the executive power belongs to the Monarch "throughout the Russian state" (article 10), as well as his is the right to issue "decrees and orders with the goal of organization and enactment of various elements of government administration" (article 11); that the judicial power is exercised in the name of the Emperor (article 22), the Fundamental Laws determined that no new law could emerge "without the approval of the state Council and State Duma." The chambers of parliament received the right of legislative initiative – "to initiate proposals to cancel or change the existing laws or issue a new law, the initiative of reconsidering which belongs solely to the Emperor" (article 107).

The basic principles of the rule of law were solidified in the Chapter 9 "On the Laws." They read as follows: (a) the rule according to the law (Article 84 "the Russian Empire is ruled on the solid foundation of laws, issued in due order"); (b) equality before the law (article 85 "the force of law is equally compulsory for all Russian subjects and foreigners present in the Russian state without

exceptions"); (c) retroactive application of law is impermissible (article 89 "Every law is valid only in the future, besides the cases, when the law itself establishes that it is valid also in the preceding time or that it represents only a confirmation and explanation of the meaning of a previous law"); (d) obligation to publish law (article 91 "laws are published for general notice by the Governing Senate in due order and are not validated prior to publication"); (e) repeal of the law only through the law (article 94 "the law cannot be repealed other than only through the force of law. Hence, until a new law positively repeals an existing law, it retains its full force"); (f) guarantees of preserving special features of legal regulations in the regions of the country (article 88 "laws, especially those issued for some area or part of the population, are not repealed by a new general law, unless such repeal is established in it").

Despite all its peculiarities, the government structure of the Russian Empire on the basis of the new additions to the Fundamental Laws fell entirely under the main features of executive monarchies (especially similar to Germany after 1871). Their main feature was the government's responsibility before the monarch and not before parliament as it had been the case in the classical parliamentary monarchies.

The Emperor appointed 1/2 of the members of the State Council, including the chairman of the upper chamber and his deputy. He has the right to veto all the bills adopted by the chambers of parliament.

Upon the proposal of the Council of Ministers the monarch had the right to issue legislative degrees in the cases, when there was such a necessity, especially between the sessions of the State Duma and State Council.

After the opening of the legislative session such a degree had to be presented for approval of the Duma, otherwise it automatically became invalid. The State Duma was elected for 5 years. It was convened and discharged by imperial decree. The monarch also defined the length of annual sessions and the length of breaks for the Duma. Commissions of deputies were formed, such as executive, budgetary, for state defense etc. Duma's proceedings were run by Chairman who had two deputies and was reelected annually by the general assembly of the Duma. The State Duma was forbidden to discuss the issues which were "the responsibility of the Sovereign" – such as diplomatic, military, and economic relations with other countries, internal affairs of the court, financial issues.

The executive power in its entirety remained in the hands of the Emperor and the ministers, who comprised the Council of Ministers. The legal status of the central executive body of general competence, which was the Council of Ministers, was changed accordingly. The Decree "On the Measures to Strengthen the Conformity in the Activities of the Ministries in Main Directorates" of October 19, 1905 stipulated that the Council of Ministers was assigned with directing and consolidating the activities of the chiefs of government bodies on issues of both legislation and supreme state administration.

Since October 1905, the Council of Ministers becomes a permanent body. The Committee of Ministers was abolished in April, 1906. Ministers bore responsibility not before the parliament, but personally before the Emperor. The Council of Ministers was comprised of Ministers and *glavnoupravlyayushchie* (chief managers) of separate departments belonging to the general structure of ministries.

In such form, the administrative apparatus existed until the beginning of World War I. Evident foreign policy failures of Tsar Nicholas's government resulted in the country's participation in World War I, which became fateful for the Russian statehood. The administrative apparatus of the Empire required changes that were called upon to secure the functioning of the government administration and the country's economy in the state of war. On August 17, 1915, the law "On Establishing Special Councils to Discuss and Coordinate Measures to Defend the Country, Provide Fuel to the Ways of Communication, State in Public Offices and Enterprises Working for the Purpose of State Defense, on Food Supplies and Transportation of Fuel, Food and Military cargoes" (Law on Special Councils 1915). The law provided for the creation of government institutions, called upon to implement the necessary mobilization measures. Four Special Councils where created: Special

Counsel to discuss and coordinate the measures to defend the country; Special Council to discuss and coordinate the measures to supply fuel to railways, state and public offices and enterprises, working for the purpose of state defense; Special Council to discuss and coordinate the measures on food supplies; Special Counsel to discuss and coordinate the measures to transport fuel, food, and military supplies.

However all the abovementioned measures could not guarantee a steady functioning of the economy under the conditions of a global military conflict. Social tension in the country began to gradually increase, and eventually destabilized the political situation at the very beginning of 1917. It and led to the abdication of Emperor Nicolas II, when monarchy rule in Russia was over, Tsar's Council of Ministers stopped to function and a Provisional Government was formed.

The rest of the government apparatus, however, remained unchanged, which was confirmed by a resolution of March 4, 1917, which placed the duties of governors and *uyezdny ispravniks* (district heads) on chairman of *gubernia* and *uyezd* elected bodies (*zemskiye upravy*), while the local government apparatus remained in place. According to this resolution, governors and vice-governors were temporally removed from office, while the chairman of gubernia elected bodies received the title of Gubernia Commissars of the Provisional Government and carried out the duties of governors. The entire old administrative apparatus remained intact and was transferred to the new elected bodies.

However, the state of diarchy could not last forever. In a confrontation with the Soviet system, the provisional government was defeated and overthrown in the course of the revolutionary events in October 1917. The imperial government apparatus was destroyed.

## The Period of Soviet Russia (October 1917–December 1991)

The process of dismantling of the imperial state apparatus and creation of new Soviet government institutions began in the revolutionary year 1917.

Over the course of the Great October Socialist Revolution in 1917 the Provisional Government was abolished and its members lost their powers. The Government's Chancery, Ministries, all central bodies of government where abolished. The apparatus of the State Duma created by Nicholas II, was also subject to liquidation. The State Council was disbanded. The functions of the tsarist police were soon transferred to the militia created by the Bolsheviks. Judiciary and penitentiary bodies of the old regime also ceased to exist. The Second All-Russian Congress of Soviets which was in session on October 25th–27th, 1917 legally established and proclaimed the creation of a Soviet republic in Russia. The decisions of the congress mark the emergence of the supreme body of state power in the republic – the All-Russian Congress of Soviets. The powers of the executive were conferred on the All-Russian Central Executive Committee (VTsIK by its Russian abbreviation). Its activity as the supreme body of power was exercised in the period between the congresses of Soviets. The government of workers and peasants, called the Council of People's Commissars (SNK by its Russian abbreviation), became an executive and administrative body of power. The government was divided into People's Commissariats which became the central bodies governing the sectors of the state economy.

The Constitution of the Russian Soviet Federative Socialist Republic (RSFSR) was adopted at the Fifth All-Russian Congress of Soviets which took place on July 10, 1918. According to the Fundamental Law of the republic, the All-Russian Congress of Soviets of Workers', Soldiers' and Peasants' Deputies was stipulated as the supreme power body. The Congress elected the All-Russian Central Executive Committee (VTsIK) which reported to the Congress.

The presidium of VTsIK was a permanent operational body controlling the work of various committees and commissions (such as the Commission on the Review of Soviet Public Servants (1917–1918), the Constitutional Commission charged with drafting the constitution (1918), Central Commission on aiding those in hunger in 1921–1922, Commission on Turkestan affairs

(until 1925), etc). Some separate special organizations, such as the telegraph agency RosTA, Socialist Academy of Public Sciences; Committee on the North, etc. – reported directly to VTsIK.

According to the 1918 Constitution, the Executive Committee was proclaimed to be the supreme legislative, administrative, and controlling body. It was the committee that defined the "general direction of activity" for the Council of People's Commissars (SNK), and all other power bodies. It issued its own decrees, resolutions, as well as considered the legislative proposals of the government. All the decisions of the government were reported to VTsIK, which was empowered to suspend or repeal any decision of the "government of workers and peasants."

The All-Russian Central Executive Committee (VTsIK) formed the government of the RSFSR – the Council of People's Commissars (SNK), which consisted of Peoples Commissars, who stood at the head of the sectoral People's Commissariats (*narkomat*).

The so-called Maly Soviet, or small council, as well as the Council of Workers' and Peasants' Defense, established on November 30, 1918, were affiliated with the Council of People's Commissars. As an extraordinary body, which issued resolutions that were compulsory for all bodies, the council supervised the entire military mobilization to defend the country. The Council, that was chaired by V.I. Lenin, included the members of the Council per se, as well as representatives of trade unions and the military. When the Civil War ended in April 1920, the Council was transformed into the Council of Labor and Defense, which coordinated the activities of all the branches of the economy and offices charged with developing the country's defense and people's economy. Another permanent commission of the Council of People's Commissars – the so-called Small SNK – was supposed to discharge the government from having to work on petty issues.

The powers of the central bodies of authority where determined in the following way. The All-Russian Congress of Soviets and VTsIK approved the changes and amendments to the Constitution, adopted decisions to incorporate other republics into the RSFSR, handled the questions of war and peace, consolidated the leadership over foreign and internal policies. The wide-ranging powers of the Congress and VTsIK extended to the economic sphere. The central bodies of authority determined the national legislation, established national taxation, developed the basics of military organization, judicial structure and procedure, etc.

According to the 1918 Constitution, the working class had the leading position in the post-revolutionary society and head electoral privileges. In such a way, congress of Soviets of towns and cities sent to the All-Russian Congress of Soviets just one deputy from 25,000 voters, while at the same time gubernia (and thus rural) congresses of Soviets delegated to Moscow only one deputy from 125,000 voters (Korzhikhina, 1994 p 42).

At the local level, administrative powers were conferred on the local Soviets. Under the conditions of the transitional period, when a new chain of command was being built, the Soviets, which originally had neither a bureaucratic apparatus nor experts, for a while used the old institutions, such as city and town zemstvas, where they appointed their commissars.

The People's Commissariat for Internal Affairs (NKVD) in it capacity of SNK branch, published on January 6, 1918 an Address to the Soviets, which reflected the main principles of local self-government. From now on local authorities were represented by the regional, *gubernia, uyezd and volost* congresses of Soviets, while village and town Soviets were established in the urban and rural places respectively.

As the Soviet system got stronger and Soviet bodies turned into fully empowered local governmental bodies, the liquidation of zemstvo in the rural areas and Duma-established bodies in the cities were completely liquidated. Consequently, the positions and powers of the Soviets expanded and they consolidated, for now on, the entire local administration, whose main task was the solve the issues of the local economy.

The affairs of national economy also acquire in this period of time a centralized organizational structure. On December 14, 1917, VTsIK and SNK created a body in charge of the Socialist

organization of the national economy: the Supreme Council on People's Economy (VSNKh). The VSNKh coordinated the work of the economic departments of the Soviets of workers', soldiers', and peasants' deputies. The economy departments were seen as the local branches of the VSNKh, for whom all the resolutions of the VSNKh were compulsory. The statutes of district or regional local councils for people's economy were developed by the VSNKh and published on December 23, 1917. There were various types of bodies that existed as part of the VSNKh at various moments of history: separate, permanent and temporary, plenipotentiary and inter-departmental advisory bodies. The most important such bodies were: the Usage Commission (1918–1921) which defined the norms for supplying enterprises and the population with food products; the Price Committee (1918–1922) which determined prices and norms for natural exchange; Special Commission on Exploration of the Kursk Magnetic Anomaly (major Iron producing area) and some others.

The Second All-Russian Congress of Soviets decided to create the People's Commissariat for Internal Affairs (NKVD) of the RSFSR, which became the central authority for the preservation of public order, combating crime, as well as for the internal administration in the country. The wide-ranging powers of the NKVD of the RSFSR solved two most burning issues: organization of a Soviet administration system in the regions, towns, and villages, as well as the preservation of "revolutionary order" as they used to say. Besides that, NKVD at and its local branches managed the utilities and worked on arrangements for prisoners of war and refugees.

Workers' militia was established in March 1917 to carry out police functions and combat crime. Originally it was an armed popular body and as such a supernumerary organization. The main legal principles for the functioning of the new body were laid down in the NKVD resolution "On Workers' Militia" of October 28 (November 10) 1917. According to the resolution, the workers' militia was founded by the Soviets of workers' and soldiers' deputies, and all militia bodies found themselves under the exclusive jurisdiction of the Soviets. Militia's main tasks were the "preservation of revolutionary order," protection of rights and security of the working people. What was common for all organizational forms of militia structures was the personnel rule: only workers and peasants could be enlisted for militia service. The accumulated experience of the workers' militia was fixed in the VTsIK and SNK Decree in June 1920. According to the Decree, militia had subdivisions organized following the territorial and sectoral principles. In such a way, various types of militia emerged: urban, rural, industrial militia, militia for the railway, water transportation, the detective militia. The entire militia system was run by the NKVD Main Directorate for Militia. Since the All-Russian Extraordinary Commission, or VChK, was an extraordinary body dissolved in 1922, part of its functions and powers were allocated to the judicial bodies, while another part – to it Main political directorate, which was formed within the NKVD.

After the 10th Communist Party Congress in March 1922, a turn to the New Economic Policy, or NEP, was proclaimed. The realization of the already existing Soviet system has led to a clarification and changes in the functions of the majority of state bodies. Soviets and Communist Party congresses developed the general directives pertaining to the activities of various government administrative structures. The district structures were clarified, so were the competencies of local Soviets. The rights of central and local bodies on property and financial rights were clarified, while the struggle against bureaucratization of the Soviets continued.

Reelections in the local Soviets took place in 1924–1925. After the USSR was formed, the number of VTsIK members was substantially increased, as representatives of autonomous and constituent republics within the RSFSR and USSR joined the rank. At the same time, the functions of the presidium of the VTsIK have substantially increased. From now on the presidium approved the draft for the SNK Decrees.

The competencies of the SNK and the Council on Labor and Defense (STO) were delineated in the beginning of 1922. Many important economic

functions, such as management of certain branches of economy, confirmation of economic plans, and reports of economic people remained within the competency of the STO. The state planning committee, or Gosplan, emerged as a part of the STO in February 1921. At the core of Gosplan stood the electrification commission known as GOELRO, which had functioned since 1920.

Within the framework of drawing up planning for the branches of the economy in 1921, Gosplan drafted such plans. In 2 years, the first 5-year plan for the entire Russian economy was prepared. As the command economy took shape at the end of the 1920s, Gosplan moved to prepare prospective plans for the development of peoples' economy, as well as to develop 5-year plans.

With the transition to the NEP, the centers and main directorates of the VSNKh transformed into control and planning bodies. The *Glavks*, or Main Directorates, became parts of the Main Departments of the VSNKh, which were organized on the basis of functionality. The large portion of enterprises, which reported to the VSNKh, was transferred to the territorial councils of peoples economy (*sovnarkhoz*) which also remained in the jurisdiction of the in VSNKh.

By 1923, ll the main directorates for the branches of the economy were dissolved and instead of them, a Main Economic Directorate and the Central Directorate for State Industry emerged in the system of the VSNKh with industrial departments within them organized according to the branches. The Main Economic Department regulated industry as a whole, while the Central Directorate for State Industry ran the "trests" (trusts) within the branches of the economy.

In December 1922, the Congress of Soviets of the USSSR adopted the Declaration and Treaty to form the Union of Soviet Socialist Republics and united all the republics into one union state. Right after that, the all-union power bodies were created: the All-Union Congresses of Soviets and the Central Executive Committee (TsIK) of the USSR. Within the constituent and autonomous republics, the congresses of Soviets and TsIK of the respective republic continued to act as the supreme authority.

The supreme body of authority of the newly created socialist state was the Congress of Soviets of the USSR. The congress was elected from the representatives of city/town Soviets (one deputy for 25,000 voters), as well as by the gubernia congresses of Soviets (one deputy for 125,000 voters).

In the period between the congresses of USSR Soviets, the Central Executive Committee of the USSR represented the top authority. It consisted of the Soviet of the Union and Soviet of Nationalities. The first one was elected at the congress from among the representatives of the republics proportionally to their population, while the second, the Nationalities Soviet, comprised five deputies from each constituent or autonomous republic and one deputy from an autonomous region. TsIK worked from session to session, and the number of TsIK chairmen was the same as the number of constituent Soviet republics.

Between the sessions of the USSR TsIK its Presidium acted as the supreme legislative and executive body of the USSR. It was elected at the joint session of the chambers – the Soviet of the Union and Soviet of the Nationalities. The Presidium of the TsIK had the power to suspend the resolutions of the government – SNK of the USSR, as well as the resolutions of the People's Commissariats of the USSR, of TsIK and SNK of the constituent republics.

TsIK also formed the supreme executive and administrative body – the Council of People's Commissars, or SNK. It consisted of a chairman, deputy chairman, and ten people's commissars (narkoms) who led various branches of government administration. Five commissars – those of foreign affairs, military and navy affairs, foreign trade, means of communication (railways), and post and telegraph – were responsible for the entire union. Another five *narkomats* were combined: VSNKh, of Food Supplies, Labor, Finance, and Inspection.

The resolutions of the all-Union *narkomats* were implemented in the territory of the republics through their representatives, while the "combined" *narkomats* operated through respective bodies of the constituent republics.

Some *narkomats* operated at the level of the republics – that's how justice, interior,

agriculture, health, enlightenment, and social *narkomats* functioned.

Each constituent republic had its own executive and administrative body – the Council of People's Commissars, or TsIk of the republics, which consisted of the republican and combined commissariats, as well as the representatives of the all-Union commissars.

Each republic changed considerably in the process of the USSR formation. From now on each republic became a part of the federated union and reported to the union power bodies. Republic's bodies had jurisdiction over the spheres, which had not been touched upon by the federal power bodies (Isayev 2004, p. 717).

One year after the formation of the USSR, in July 1923, federal economic management bodies emerged. VSNKh of the USSR as well as the USSR *narkomats* dealing with the economy, the union-republican *narkomats* of the USSR, special commissions following functions and branches of the economy, directorates and main directorates of the USSR. Within the Soviet republics, the organization and management of the economy was conferred upon the SNKh of the republics, the union-republican and republican *narkomats* of the republics.

Public administration system was based on the narkomats of three types: the all-Union ones, union-republican ones, and republican ones. The first type of bodies were involved with direct management, they were uniform and centralized power bodies that ran the sphere of public management that was entrusted to them throughout the USSR through respective offices or immediately. The so-called union-republican *narkomats* had a decentralized structure: a USSR *narkomat* managed the respective branch through the respective *narkomat* of the republics. The *narkomats* of the republics exercised their management directly within the territory of a USSR republic.

Committees, main directorates, and commissions, affiliated in different ways with the narkomats, were based on both branch and functional principles.

On December 5, 1936, the 8th Extraordinary Congress of Soviets adopted the Constitution of the USSR. The new fundamental law fixed the Soviet system as the basis of the political system for the entire union state. According to the Constitution, the fullness of power in the country belonged to the Soviets of Working People's Deputies. Socialist property and socialist economy were declared to constitute the economic base of the USSR.

The state structure of the USSR was defined as a union (federative) unification of the republics. Instead of the all-Union, republican and regional congresses of Soviets, the new "Stalinite" Constitution proclaimed the emergence of district, city/town (urban) and republican Soviets.

The Supreme Soviet of the USSR, which replaced VTsIK, found itself at the top of the power hierarchy. The Supreme Soviet commanded legislative power and consisted of two chambers: the Council of the Union and the Council of Nationalities. The Council of the Union was elected in territorial districts, while the Council of Nationalities was elected in the constituent, autonomous republics as well as in the autonomous regions and national districts. The both chambers were considered to have equal rights and worked in sessions. If major disagreements occurred over the course of decision-making, the Presidium of the Supreme Soviet had the right to dissolve the Supreme Soviet and call new elections to the supreme board.

At the same time, the Presidium reported to the Supreme Soviet and had rights to issue decrees, conduct referenda, call new elections, and exercise supreme power in the country in the period between sessions of the Supreme Soviet.

The Council of People's Commissars of the USSR was elected at the joint session of the both chambers of the Supreme Council. The government issued resolutions and orders on the basis of existing laws, which had been adopted by the Supreme Soviet. The existing narkomats (defense, foreign affairs, foreign trade, railways, communication, waterways, heavy industry, defense industry), as well as the union-republican narkomats (food, light industry, forestry, agriculture, grain and animal Soviet farms, finance, internal trade, internal affairs, justice, health) were fixed in the Constitution. The government system in the republics was structured analogously.

The 1936 Constitution radically changed the electoral law. The fundamental law stipulated the general, equal and direct electoral right with secret ballot for all USSR citizens older than 18.

Within the framework of the new Constitution, the system of public administration substantially changed in the years before World War II. In July 1937 the TsIK of the USSR, which did not stop to function up until the election of the new Supreme Soviet, approved the Statutes of election to the Supreme Soviet and set the date of election.

At the first session of the Supreme Soviet the Presidium was elected, the government (SNK) formed, the Prosecutor of the USSR appointed, and permanent commissions of the both chambers were elected.

After the Nazi Germany attacked the Soviet Union and the Great Patriotic War (1941–1945) began, the public administration system switched to the war-era mode. The supreme and central power bodies continued to function, while at the same time extraordinary bodies emerged, such as the State Defense Committee (GKO), local defense committees, GKO commissioners, whose main goal was to mobilize all the existing resources.

The extremely centralized government apparatus became even more goal-oriented during the war period. The centralization strengthened in the field of the all-Union bodies funning the basic industries. Principles, according to which the government bodies functioned, also changed: undivided authority came to replace collective decision-making, cooptation replace elections, supervision took the shape of a tough control followed by sanctions (Korzhikhina 1994, p. 196).

The sectoral principle of managing the economy remained in place under the war-time conditions. A strengthened centralization could be seen in the process of allocating funds and supplying the economy with raw materials, fuel, and other resources; industrial facilities were relocated, while new industrial centers, mainly in the east of the country, emerged in the process. The defense industry as such, in which new institutions were created during the war, underwent major changes.

After the war was over, the constitutional principle in the administration was restored. Serious changes took place in 1946 in the upper echelons of power in the USSR, constituent and autonomous republics. In this way, Councils of Ministers were created to replace the former Council of People's Commissars of the USSR, constituent and autonomous republics. The narkomats were replaced with ministries.

There were special institutions within the government or affiliated with it, which differed in their functions and remained at the core of the central economic management. They were in charge of the ministries' and other institutions' activities in various economic sectors. There were several types of such bodies. The main directorates had operative tasks, were charged with management of enterprises, organizations, etc. Committees and commissions combined planning and control functions or wielded just one of them. They could be divided into two groups: the State Committees of the USSR Council of Ministers, which organized the work of ministries and other institutions on common issues (the State Committee on Foreign Economic Relations, Gosplan et al.) and State Committees organized to follow a narrow sector of production (the State Committee for Defense Technology, the State Committee for Chemical Industry, etc.)

Ministries are the bodies of both centralized and sectoral management, which run specific branches of economy and culture. The heads of ministries were Cabinet members. The principle of undivided one-man authority was in place, and ministers were empowered to issue orders and instructions. Ministries were also divided into the federal, republican, and federal-republican.

As far as the federal USSR ministries are concerned, they existed in the branches of economy, were it was necessary to message everything from one center. They ran a specific industry throughout the country. Republican ministries existed in the industries, where local and ethnic traditions played an important role. Essentially they were the sectoral management bodies of a republic, that worked under the leadership of the Council of Ministers of a specific constituent republic. The USSR central goodies run the

industries through republican ministries, while the most valuable enterprises reported directly to them.

In 1955–1956 measures were undertaken to expand the economic management rights of the constituent republics. A large number of enterprises were transferred from the federal to the republican domain. Every year the number of such enterprises grew. As a result several federal ministries were no longer relevant and were liquidated. In the republics, however, there was a reversed trend leading to the emergence of new government bodies.

A law was adopted in 1957 that established the territorial principle of managing the economy and construction. Economic administrative regions were formed that reported to the top bodies of authority in the respective republics. Such regions were formed on the basis of economic and administrative peculiarities of certain territories. Altogether about 140 ministries were closed down, leading to personnel cuts. The management of an industry moved closer to the production sites. Powers in the field of design, supplies, and finances were expanded.

The sovnarkhoz (SNKh), or People's Economy Councils, were radically different from the ministries through a collegiate management of several industries on one concrete territory. The SNKh managed some very important factories, industrial associations, and companies in a specific economic district.

The SNKh were mainly organized in one branch of the economy. In order to fulfill an especially important task in the country's economy, Technical and Economic Councils were formed in association with the SNKh. They consisted of scientists, researchers, technical experts, etc.

Originally, the SNKh reported directly to the Council of Ministries of a specific republic. But eventually republican SNKhs were organized, in order not to overload the central government. The SNKhs in a republic had to be responsible for the most important tasks in the field of material and technical supplies for the industries, as well as for the organization of SNKh in the republic.

In the early 1960s, the *sovnarkhozes* have been merged in order to reduce their number. 1962 saw the creation of the Council for National Economy of the USSR ("SNKh") as a pan-Union executive body charged with managing of the supply plans and the distribution of goods. This institution executed its authority though the Councils of Ministers (Governments), the *sovnarkhozes* and ministries of the individual Union Republics. Further on, the Council of National Economy was made a two-level "Union-Republican" body. Hereafter, the Soviet Government considered issues that went beyond the approved economic plan. In 1963, the Supreme Council for National Economy ("VSNKh") was introduced as the topmost all-Union body managing the state industry, construction, and operating all State Committees and institutions overseeing industry outlets subordinate to the "VSNKh."

A new economic reform organized in 1965 was initiated to repair the damage and shortcomings of the earlier management system. This proved the largest reform in the post-WWII years aimed at adjusting the state economic management to the challenges of the time.

The essence of this reform was in the changing of the industry management system – from territorial to branch-specific. To this end, the SNKh of the USSR, the VSNKh, and territorial *sovnarkhozes* had been eliminated and a new system of Republican ministries introduced.

In 1967, the USSR Council of Ministers issued a decree "General regulation on ministries of the USSR" which clearly outlined the definition of "Ministry," its functions, types, and authority. The authority of such pan-Union Ministries was enhanced with regard to similar republican Ministries. The jurisdiction of pan-Union Ministries covered all matters of a certain branch of industry plus the operations of any production overseen by a Republican Ministry. To this end, all resolutions and instructions of the pan-Union Ministries were mandatory for Republican Ministries. Plus, an ad hoc Collegium of an all-Union Ministry had the authority to hear any Republican Minister called to report.

The results of the reforms of the state structure were finalized in the 1977 Constitution of the USSR. Two sections of the Constitution regulated the state bureaucracy, both the central and local

administration. No special changes had been made to the Soviet system, with the introduction of new nomenclature. For instance, the Soviets of workers' deputies were now labeled Soviets of people's deputies. The tenure of a Soviet was extended.

The highest body of state authority was the Supreme Soviet of the USSR whose jurisdiction included all matters regarding the Soviet Union. The Supreme Soviet of the USSR was a two-chamber body comprised of the Council of the Union (upper chamber) and the Council of Nationalities (lower chamber), operation in sessions with the Presidium of the Supreme Soviet of the USSR as its standing body. The tenure of the Supreme Soviet of the USSR was now 5 years. Local Soviets were given a two and a half years' tenure. The age of candidacy had also been reviewed, changing to 21 years for the Supreme Soviet of the USSR and 18 years for the Supreme Soviets of the Soviet and Autonomous Republics. The total number of deputies elected to both chambers of the Supreme Soviet of the USSR was now established at 750 members.

The authority of the Soviets of people's deputies was enhanced to involve a wider scope of issues. Local Soviets had enough authority to oversee and intervene in the operations of any industrial facility in their jurisdiction which in fact meant every single within their territorial jurisdiction. The role of the Presidium of the Supreme Soviet of the USSR had been increased allowing it to actually directly govern all local Soviets ignoring the governing bodies of the Union Republics. This general trend for centralization was characteristic of that historical period in the evolution of the Soviet state.

The Council of Ministers – the Government of the USSR – was the country's highest executive and administrative body. Some new structures were added to the executive branch – for instance, a new Ministry for medical production was introduced. Also, the duplication of government ministries and other state institutions had been eliminated. The Council of Ministers was formed by the Supreme Soviet of the USSR in a joint session of the Council of the Union and the Council of Nationalities, with ballots on the Chairman of the Council of Ministers, First deputy Chairmen, Ministers and Chairmen of State Committees of the USSR. The Council of Ministers also comprised the Chairmen of the Councils of Ministers of the Union Republics. The Supreme Soviet of the USSR had the authority to include officials form other state agencies and members of other entities of the USSR into the Council of Ministers at the initiative of the Chairman of the Council of Ministers of the USSR.

The Council of Ministers of the USSR retained its functions in full until a new Supreme Soviet of the USSR was elected. The Council of Ministers of the USSR was empowered to resolve a vast number of matters of state administration Including measures to ensure state security, protection of citizens' rights and freedoms, providing relations with foreign states and other issues of supreme importance. The Council of Ministers of the USSR had the authority to suspend the execution of resolutions and ordinances of the Councils of Minister of Union Republics and to rescind acts of ministries and state committees of the USSR. All governing ordinances of the Council of Ministers of the USSR had mandatory power throughout the USSR.

The 1977 Constitution of the USSR legitimized the Committee of People's Control of the USSR, created as far back as 1965. Similar Committees had been installed at all administrative levels, and also within units of industry, at state farms (kolkhozes), Soviet Army units, etc. The state managing functions of the Communist Party had been enhanced and centralized. The role of state bodies of management had been modified while the role of the Soviets was diminished. Changes to this did occur until after the April 1985 Plenum of the Communist Party Central Committee, when novelties to the social-political structure were introduced along with the development of democratic institutions.

New legislature adopted between 1988 and 1990 established a new state bureaucracy system. A new institution was formed: the office of the President of the USSR. The President was to be the head of state elected through a vote for a 5-year term of office for no more than two terms.

Mikhail S. Gorbachev became the President of the USSR.

The President could be deposed only at the initiative of the Congress of Peoples' Deputies following a majority vote of two-thirds and after a ruling of the Committee of Constitutional Supervision of the USSR.

The President was charged with control over the bodies of state power and management and ensuring their interaction, reporting to the Congress of Peoples' Deputies on the state of the nation.

The Supreme Soviet of the USSR and the Congress of Peoples' Deputies, acting on a move by the President of the USSR, had the authority to approve and dismiss candidates for such positions as the Chairman of the Government of the USSR (Prime Minister), Chairman of the Supreme Court, Prosecutor-General, Chairman of the Supreme Court of Arbitration, and personally each member of the Committee of Constitutional Supervision of the USSR. Additionally, the President also held the position of the Supreme Commander-in-Chief of the Armed Forces of the USSR.

The President was charged with executing the national foreign policy. His authority included engaging in negotiations, signing international treaties, the approval and dismissal of diplomatic officials, etc. The President of the USSR had the power to declare a state of emergency and martial law within specific territories and with the approval of such action by the Presidium of the Supreme Soviet of a specific Union Republic. He also was empowered to declare a mobilization and introduce direct presidential rule. The President was also Head of the Security Council of the USSR in charge of the national defense and all matters of national security, including economic, ecological, etc.

The legislative power was entirely vested in the representative branch: the Congress of Peoples' Deputies of the USSR and the Supreme Soviet of the USSR.

Adopting and amending the Constitution of the USSR was the exclusive competence of the Congress of Peoples' Deputies, as was the resolution of issues of internal and national borders of the state, and the national-state structure. The general direction of domestic and foreign policy, the outline of state economic plans, elections to the Supreme Soviet of the USSR, electing the Chairman and the 1st Deputy Chairman of the Supreme Soviet of the USSR was also defined by this body.

The Supreme Soviet of the USSR is the highest legislative and administrative body in the power structure of the USSR. With a 5-year term, it has been elected by the Congress of Peoples' Deputies of the USSR and reported directly to the Congress. The Supreme Soviet of the USSR comprised two chambers: the Council of the Union and the Council of Nationalities. Alongside regular sessions of the Supreme Soviet, the Chairman of the Supreme Soviet of the USSR, the President of the USSR and the supreme body of power of a Union Republic had the authority to call for extraordinary sessions.

The Supreme Soviet of the USSR had authority to call for elections of peoples' deputies, to form and dismiss the Government and state agencies – at the initiative of the President of the USSR. The Supreme Soviet was empowered to approve the Prime Minister, elect the Supreme Court of the USSR, to appoint the Prosecutor-General of the USSR and the Chairman of the Control Chamber of the USSR and the members of the Supreme Court of Arbitration of the USSR. Formulating the basic principles of national legislature of the USSR and regulating taxation issues was also within the competence of the Supreme Soviet of the USSR. It was charged with ratification of international treaties, declaring national referendum, overriding the rulings of the Council of Ministers and supervising the Control Chamber of the USSR.

In 1991, the Cabinet of Ministers became the highest executive-administrative body and the Government of the USSR. This power body was empowered to resolve all matters of state administration insofar as they did not come within the competence of the Congress of Peoples' Deputies of the USSR, the Supreme Soviet of the USSR, or the Federation Council of the USSR. The Cabinet of Ministers reported directly to the President of the USSR, with only the Supreme Soviet of the USSR having the power to rescind any of its

decrees and ordinances. The Prime-Minister was nominated by the President of the USSR and approved by the Supreme Soviet of the USSR. The Cabinet of Ministers comprised the ministers, the Prime-Minister and his Deputies. Heads of the Governments of Union Republics could attend Cabinet meetings with a casting vote.

The principal functions of the Cabinet of Ministers of the USSR were the execution of a holistic national fiscal policy, planning and fulfilling the national budget, implementing nation-wide economic programs, managing the national fuel and energy industry and the national transportation.

The April 1985 Plenum of the Communist Party Central Committee outlined the plan for Perestroika and the shift from the administrative-command state management system to an economic, with a transfer to market-like economy. In 1990, the Union-Republican ministries and State Committees were dismantled and replaced with special collegiums within republican ministries comprised of republican national administrators. The State Planning Committee of the USSR (Gosplan) and the State Supplies Committee of the USSR (Gossnab) were discontinued.

On June 12, 1990, the 1st Congress of Peoples' Deputies of RSFSR adopted the Declaration of State Sovereignty of the RSFSR. This marked the start of a constitutional reform in Russia and helped speed up the process of regaining state sovereignty by other subjects of the Soviet Union. For the first time in the history of RSFSR, the Declaration included ideas of principal importance: the equality of political parties and public unions; the separation of the branches of power; supremacy of the Constitution and laws of the RSFSR throughout the entire territory of the Russian Soviet Federative Socialist Republic; the need for broader rights for Autonomous Republics and Autonomous Districts within RSFSR; and the need for a new Union Treaty. At the same time, the Congress voted to amend the RSFSR Constitution and the introduction of the office of the President of Russia. On June 12, 1991 Boris N. Yeltsin was elected as first President of Russia.

On December 8, 1991, leaders of Belorussia, the Russian Federation (RSFSR) and Ukraine met at Belovezhskaya Pushcha in Belarus to sign agreement between the Republic of Belarus, the Russian Federation (RSFSR), and Ukraine on the formation of the Commonwealth of Independent States (CIS). The meeting also denounced the 1922 Treaty on the Formation of the Union of Soviet Socialist Republics and declared that all state structures of the USSR were discontinued and ceasing to operate.

The history of the Soviet Union came to an end. On December 24, 1991, the USSR ceased to be a member of the United Nations, with the Russian Federation taking its seat. On December 25, 1991, the State Flag of the USSR flying over the Moscow Kremlin had been brought. On December 26, 1991, a session of the Council of Republics – a newly-formed upper chamber of the Supreme Soviet of the USSR – adopted a Declaration stating that the USSR ceased to exist as a state and as a subject of international law.

## The Contemporary Stage of Public Administration

The Declaration of State Sovereignty of Russia on June 12, 1990 with the consecutive dissolution if the Soviet Union in late 1991 laid the base for fundamental changes in the form of government, first and foremost the elimination of the system of the Soviets. The 1993, Constitution legitimized the system of state power in Russia in the context of the separation of the branches of power. It had defined the executive as an autonomous branch, introduced the concept of a "single system of executive power." The latter is formed by the federal bodies of executive power and such of the Subjects of the RF within the matters of exclusive competence of the Federation and those of joint competence.

The 1993 Constitution established that "the state power in the Russian Federation shall be exercised on the basis of its division into legislative, executive and judicial power. The bodies of legislative, executive and judicial power shall be independent" (Article 10). Article 11 lists the bodies of state power: the President of the Russian Federation, the Federal Assembly (the Council of the Federation and the State Duma),

the Government, and the courts of the Russian Federation. Together, these form the foundations of the constitutional system of the Russian state.

The President forms the Presidential Executive Office (Administration of the President), a state body providing support for the President's work and ensuring the execution of the President's power and the implementation of the President's decisions. The Administration of the President also provides organizational support of the State Council of the Russian Federation and other Presidential Councils and Commissions.

The legislative branch of the Russian Federation includes the Federal Assembly of the Russian Federation, is comprised of two chambers – the Federation Council of the Federal Assembly of the RF and the State Duma of the Federal Assembly of the RF – which differ in status, scope of power and method of assembly, and legislative bodies of the constituent entities of the Russian Federation.

The Constitution of the RF delimits the jurisdictions of each of the chambers of the Federal Assembly of the RF, clearly defining matters assigned to the Council of Federation and the State Duma.

The powers accorded by the art. 102 of the Constitution of the RF to the Federal Council of the RF are as follows: approval of changes in borders between the subjects of the Russian Federation; approval of a decree of the President of the Russian Federation on the introduction of martial law and of a state of emergency; deciding on the possibility of using the Armed Forces of the Russian Federation outside the territory of the Russian Federation; declaring of elections of the President of the Russian Federation; impeachment of the President of the Russian Federation; approving the president's nomination and removal of judges of the Constitutional Court of the Russian Federation, of the Supreme Court of the Russian Federation, of the Supreme Arbitration Court of the Russian Federal government; approving the president's nomination and removal of the Prosecutor General and the Deputies Prosecutor General of the Russian Federation; appointment and removal of Deputy Chairman and half of the auditors of the Accounting Chamber. The Federal Council adopts resolutions on the issues referred to its authority.

According to paragraph 3 art. 95 of the 1993 Constitution of the RF, the State Duma of the Federal Assembly of the Russian Federation consists of 450 deputies. The State Duma has deputies associations: fractions and groups.

The key focus area of the State Duma of the Russian Federation is adopting federal constitutional and federal laws (bills and decrees); laws of amendments to the Constitution of the RF. For these procedures, the State Duma establishes deputies committees (e.g., economic policy, agriculture, geopolitical issues, etc.), the credentials commission to count secret votes, verify data on events and officials' credentials, and other commissions for in-depth consideration of various issues; it also performs detailed review of bills within the scope of competence of its specialist units. The headcount of each committee is decided by the State Duma, but it cannot be less than 12 or more than 35 chamber deputies.

In addition to its key legislative function, the State Duma has the right to make decisions on other matters in its jurisdiction enumerated by the Constitution of the Russian Federation, including: appointing and dismissing of the Chairperson of the Central Bank of Russia; appointing and dismissing the Commissioner for Human Rights, appointing and dismissing the Chairperson and half of the auditors of the Accounts Chamber of the Russian Federation; giving consent to the appointment of the Chairperson of the Government of the Russian Federation by the President of the Russian Federation and deciding the issue of confidence in the Government of the Russian Federation; announcing amnesty; bringing charges against the President of the Russian Federation for his impeachment if convicted of a crime; etc.

Over the past few decades, the modern structure of the Executive branch of the Russian Federation has undergone major changes and transformations. A special role belongs to the President of the Russian Federation who, not being part of either branches, exercises significant authority in relation to all of them. Moreover, most of it is the authority over the executive branch.

Legal foundations for interaction between the President of the Russian Federation and the executive authorities are entrenched in Chapters 4 and 6 of the Constitution of the Russian Federation and in Federal Constitutional Law No. 4-FKZ "On the Government of the Russian Federation." According to Art. 110 of the Constitution of the RF, the executive power in Russia is exercised by the Government of the Russian Federation. The Government of the RF is a federal executive body with general competence covering areas such as economic development, social and cultural activities, administrative and political issues, and law enforcement. As a collective executive, the Government of the Russian Federation consists of the Chairperson of the Government of the Russian Federation, Deputy Chairperson of the Government of the Russian Federation and federal ministers (Par. 2, Art. 110 of the Constitution of the RF).

Decree of the President of the Russian Federation No. 314 of 2004 "On the System and Structure of Federal Bodies of Executive Power" was an important milestone in the development of the executive branch of Russia. This Decree clearly defined three types of executive organs: (1) federal ministries; (2) federal agencies; and (3) federal services.

Federal ministries develop state policies for their respective areas of responsibility and regulate these areas, coordinate and control their subordinate federal services and federal agencies, and coordinate public non-budgetary funds. Federal services control and oversee their respective areas of responsibility and perform special functions in the sphere of defense, national security, national border control, crime prevention, and public safety. Federal agencies provide public services, manage public property, and enforce the law.

The constitutional amendments of 4 July 2020 provide for a large-scale revision of approaches to the arrangement of executive authorities and formation of the Government of the Russian Federation. Thus, they grant the President of Russia the right to carry out general guidance of the Government, approve and modify the structure of the federal bodies of the executive power proposed by the Chairperson of the Government; in the structure of federal executive authorities, identify those reporting to the President of the Russian Federation, and those subordinate to the Government of the Russian Federation.

The constitutional amendments have significantly modified the Government of the Russian Federation formation procedure. From now on, the "security-wing" ministers will be appointed upon consultations with the Council of Federation, and the deputies of the Chairperson of the Government and the "socioeconomic-wing" ministers upon approval by the State Duma. The amended Constitution also provides a legal mechanism preventing any delays in the formation of the Government by setting timelines for approval by the State Duma of candidates for positions in the Government, as well as the allowed number of nomination rejections and the course of action in the event a significant number of nominations have been rejected.

The Russian Federation has authorities (institutions and agencies) that are not a part of any branch of power. These authorities include: the Office of the Prosecutor General of the RF, the Central Bank of the RF, the Accounts Chamber of the RF, the Central Elections Commission of the RF, the Human Rights Commissioner of Russia, etc.

For the system of public administration of the Russian Federation, the differentiation between federal and public authorities of the constituent entities of the Russian Federation is of great practical importance.

While the list of bodies exercising state power in the Russian Federation in part 1 Art. 11 of the Constitution of the RF is exhaustive, for the bodies of state power of the constituent entities, the part 2 of the same article establishes only a general principle: "State power in the constituent entities of the Russian Federation shall be exercised by the bodies of state authority created by them."

However, up until October 19, 1999, the regions had been forming such system based solely on the provisions established by their own constitutions and statutes. With the adoption of

the Federal Law of October 6, 1999, No. 184-FZ "On the general principles of organization of legislative (representative) and executive bodies of state power of the constituent entities of the Russian Federation" (hereinafter – FZ-184), the requirement of art. 72 of the Constitution of the Russian Federation, as well as the necessary conditions for creating and organizing activities of legislative and executive bodies in the regions, have been fulfilled.

According to art. 2 of the FZ-184 "the system of state power bodies of the constituent entity of the Russian Federation consists of: the legislative (representative) body of state power of the constituent entity of the Russian Federation; the supreme executive body of state power of a constituent entity of the Russian Federation; other government bodies of a constituent entity of the Russian Federation, formed according to the constitution (charter) of a constituent entity of the Russian Federation. The constitution (charter) of the constituent entity of the Russian Federation may establish the position of the highest official of the constituent entity of the Russian Federation."

The legislative (representative) body of the state power of the constituent entity of the Russian Federation is the only acting supreme body of legislative power of the constituent entity of the Russian Federation. Its name and structure are established by the constitution (charter) of the constituent entity of the Russian Federation, taking into account the historical, national, and other traditions of the constituent entity of the Russian Federation. The names of regional legislative bodies can vary, among them: legislative assemblies; regional dumas; state assemblies; state councils; khurals; and population assemblies.

In the constituent entity of the Russian Federation, a system of executive authorities is established with the dominant supreme executive body of state power of the constituent entity of the Russian Federation. The structure of the executive bodies of state power of the constituent entity of the Russian Federation is determined by the highest official of the constituent entity of the Russian Federation (the head of the highest executive body of state power of the constituent entity of the Russian Federation) following the constitution (charter) of the constituent entity of the Russian Federation.

According to clause 3 of art. 18 of FZ-184, the highest official of the constituent entity of the Russian Federation (the head of the highest executive body of state power of the constituent entity of the Russian Federation) is elected by the citizens of the Russian Federation residing on the territory of this constituent entity of the Russian Federation and having active suffrage, based on universal equal, and direct suffrage by secret ballot. However, on March 9, 2016, Federal Law No. 66-FZ amended the Federal Law FZ-184. This way, clause 3.2 of art. 18 also provides for the second way of electing the highest official of the constituent entity – by the deputies of the legislative (representative) body of state power of the constituent entity on the proposal of the President of the Russian Federation in accordance with the list of proposed candidates (party's lists of candidates must be allowed to distribute deputy mandates). Thus, the President of the Russian Federation submits to the legislative (representative) body of state power of the constituent entity of the Russian Federation a proposal on the candidacy of the highest official of the constituent entity of the Russian Federation from among the candidates presented by the political party, including those who are in the federal reserve of management personnel.

Local governance, so-called local self-governement, operates on various Russian Federation territories defined by law as "municipalities," such as: urban, rural settlements; municipal areas; municipal districts; urban districts; urban districts with intracity division; intracity areas; intracity territories of cities of federal importance.

Local self-government bodies and their officials play a significant role in resolving the issues of local importance. Local self-government is the representative body of the municipality, the head of the municipality, the local administration (executive and administrative body of the municipality), the control body of the municipality, other bodies and elected officials of local self-government provided for by the charter of the

municipality and having their own powers to resolve the issues of local importance.

The structure of local self-government bodies must necessarily include a representative body, the head of the municipality, and the local administration (executive and administrative body of the municipality); this does not apply to rural settlements, where the number of residents eligible to vote is less than 100 and the powers of a representative body are exercised by a gathering of citizens.

The procedure for the formation, powers, term of office, accountability, controllability of local self-government bodies, as well as other issues of the organization and activities of these bodies, are determined by the charter of the municipality. The names of the representative body of the municipal formation, the head of the municipal formation, the local administration (the executive and administrative body of the municipal formation) are established by the law of the constituent entity of the Russian Federation, taking into account historical and other local traditions.

## Conclusion

The history of Russian state administration has been a long and controversial evolution towards the creation of a state based on a constitution, a state regulated by the provisions of its main constitutional law. The most significant steps in this direction were taken in second half of the nineteenth and beginning of the twentieth century, although some attempts in establishing democratic states had been made before. Just like in many other countries, there have been periods when, what at the time was considered democratic power institutions were formed and significant legislative acts establishing legal boundaries for both, the society and the state.

It has been demonstrated by the law codes established at the times of Russkaya Pravda, Novgorod, Pskov, Vyatka Republics, then Zemsky Sobor – Ivan's the Terrible parliament of feudal states; the 1649 code Sobornoye Ulozheniye, the establishment of the tradition dynastic government; boyars council Boyar Duma, with its lawmaking power later transferred to Governing Senate by Peter the Great in the eighteenth century. Local political bodies "zemstvo" established under Alexander II, his Emancipation Reform of 1861; the code of state laws in the Russian Empire of Nicolas II.

The Soviet state model has turned out to be an unsuccessful sociopolitical experiment that ended with a collapse of the Soviet Union in 1991 ending that form of public administration.

With the 1993 establishment of the Constitution of the Russian Federation, a new model of the state governance emerges, separating legislative and executive branches within in a presidential system.

Substantial amendments to the Constitution of the Russian Federation introduced changes to the government model and public administration were approved on 1 July 2020 by a contested popular vote.

# Public Administration in the United Arab Emirates: Continuity and Changes

Alaa Aldin Abdul Rahim A. Al Athmay and Abu Elias Sarker
Department of Management, University of Sharjah, Sharjah, United Arab Emirates

## Synonyms

New public management reforms in the UAE; Public sector reforms in the UAE; Public sector, market, and society in the UAE

## Definitions

Public administration in the UAE refers to the dynamic coexistence of the state, market, and society with the executive arm of the state playing the most prominent role in the country's socioeconomic transformations.

Public administration in the UAE signifies a unique combination of tradition and modernity.

## Introduction

Public administration as a field of study and practice has attained considerable maturity over the years. With the risk of over simplification, public administration is considered as an action part of the government. But in reality, the presence of public administration is felt in every sphere of the state and society. The purpose of this chapter is to provide a comprehensive overview of the system of public administration in the United Arab Emirates (UAE). The UAE is one of the oil-rich Middle Eastern countries with a modern and dynamic public administration system. As an independent state, the UAE started its journey in 1971 when seven Emirates – Abu Dhabi, Dubai, Sharjah, Ajman, Umm Al Quwain, Fujairah, and Ras Al Khaimah – opted to form a Federal state. Before that, all Emirates were known as the Trucial States in reference to the treaty relations established with the British in the nineteenth century. The British colonial power signed a series of agreements with these individual Emirates on different matters (Sarker and Al Athmay 2017).

The system of public administration in the UAE is a combination of tradition and modernity. Both features will be highlighted in this chapter. Special attention has been given to administrative reforms undertaken over the last two decades. First, it will provide a description of the system of public administration focusing on the three branches of government – executive, legislature, and the judiciary. Second, a governance perspective of modern public administration will be discussed focusing on the interactive relationships between the public sector, the private sector, and civil society. Third, special emphasis will be given to the structure of civil service and associated practices.

## Federal Government

The Constitution of the UAE provides a Federal government and seven local governments. As per the Constitution, the responsibilities are clearly divided between the Federal and local governments. The Federal government has five distinct institutions – the Supreme Council of Rulers, the President, the Federal National Council (FNC), the Council of Ministers, and the Federal Judiciary.

The Supreme Council of Rulers is the most powerful Federal government institution comprising seven Rulers of seven Emirates. It enjoys both legislative and executive powers. It has the authority to approve all legislations, decide all vital policy matters, and approve international treaties. It elects the President and the Vice President and appoints and dismisses the Prime Minister and the judges of the Supreme Court (Sarker and Al Athmay 2017).

The Council of Ministers is the executive branch of the Federation. It executes all internal and external affairs of the Federation as per the provisions of UAE Constitution and the Federal laws. It works under the supervision of the President and the Federal Supreme Council. Currently,

the Cabinet is headed by H.H. Sheikh Mohammed bin Rashid Al Maktoum. He is also the Vice President of the Federal government and the Ruler of Dubai. At present, there are 31 members of the Cabinet of whom 9 are women. The Federal government structure comprises 17 Ministries and 32 independent Federal authorities.

Significant developments have taken place over the years in the way the Cabinet functions in the UAE. The most significant reform was implemented in 2016 when there was a new reshuffle that introduced new ministry portfolios and made structural changes to existing ones. Six new Ministers were appointed, including three women. The new government was mandated to develop knowledge, support science and research, and involve youth in leadership of the nation toward 2071.

The UAE Federal Judicial System has three tiers – the Court of First Instance, the Court of Appeal, and the Court of Cassation. The Constitution has granted all the Emirates to have their own court system. Only Dubai and Ras Al Khaimah have separate judicial system. The Court of First Instance consists of three divisions – civil, criminal, and *Shariah.* Personal matters such as marriage, divorce, inheritance, and, more recently, drug offenses and offenses involving minors are within the domain of *Shariah* law. The Court of Cassation is the highest court and hears cases that have disputes based on matters of law. Dubai has a three-tier judicial system similar to the three Federal levels.

The Federal National Council (FNC) is a unicameral legislative branch of the government. It consists of 40 seats which are allocated among seven emirates – 8 for Abu Dhabi, 8 for Dubai, 6 for Sharjah, 6 for Ajman, 4 for Ras Al Khaimah, 4 for Fujairah and 4 for Umm Al Quwain. Out of 40, 20 members are appointed by the Rulers of the 7 constituent Emirates, and 20 are indirectly elected by an electoral college whose members are selected by each Emirate Ruler proportional to its FNC membership. Members serve a 4-year term. As per the Constitutional provisions, the FNC is basically a consultative body. All bills, policy matters, national budget, and international treaties are discussed in the FNC. Members can deliver on all these matters and recommend changes. The approving authority lies with the Supreme Council of Rulers (GoUAE 2011).

The national assembly has undergone some significant changes over the last one decade or so. At the political level, the government is following the gradualist approach. It intends to move toward empowering the national legislature gradually as per the Constitutional commitment. Indirect elections are in place since 2006 for half of the constituencies. While in the first election, only a limited number of voters were inducted into the electoral colleges, the latest elections opened up wider participation of unlimited numbers of voters in the electoral colleges. Considering the uniqueness of the political system, this gradualist approach appears to be appropriate (Sarker and Al Athmay 2017).

## Local Government

The Constitution has granted substantial autonomy to the seven Emirates. All the Emirates have their own administrative jurisdictions headed by the respective Rulers. Abu Dhabi, Dubai, Sharjah, and Ajman have their own Executive Councils. Abu Dhabi and Sharjah have their own National Consultative Councils with similar local duties and role as the Federal National Council. Both Councils are chaired by the Rulers. All Emirates have departments resembling the Federal Ministries. There are eight municipalities, one each for six Emirates except Abu Dhabi which has two municipalities for the western and the eastern regions.

Each Emirate of the UAE handles its authorities that are not assigned by the Constitution of the Federation. All member Emirates of the Federation strive to coordinate their decrees in all areas to achieve standardization (GoUAE 2011).

There is also a traditional institution known as *majlis*. It is meant for the Rulers to hold open discussion with the people. This is held periodically, administered by the Rulers and the senior members of their families.

## Public Administration as Governance

The plurality of state with interactive relationships between the government, the market, and civil society has become a common discourse in public administration literature. In this era of globalization, the UAE government has fathomed the significance of the coexistence of these three domains in the pursuit of its national agenda.

Historically, the public sector has always been the engine of economic and social development in the UAE. Like other developmental states, the UAE state has also come forward to help the private sector grow in the country. The UAE has an open and liberal economy. The oil boom in the 1970s helped the government to invest heavily in infrastructures and social sectors. The fiscal measures in fact established the linkage between the government and the private sector. Market-oriented liberalization opened the gate for foreign direct investment in and outside free zones. At the same time, the government's initiatives continue to promote local entrepreneurship through different kinds of incentives. Now both the government and the business community work in harmony in both the formal and informal ways (Hvidt 2009; Mansour 2017).

Unlike the Western system, essential public services provided to Emiratis and expatriates are not subject to market contestation. Most sectors except a few are subject to competitive markets. Different kinds of user fees have been introduced. Corporate management precepts have been introduced in both public service organizations and public enterprises in order to maximize efficiency of the public service delivery system (Sarker and Al Athmay 2017; Uddin et al. 2014). The government has imposed recently 5% value-added tax. Efficiency of the product market is also an indicator of marketization in the UAE.

Unlike developed and many developing countries, privatization has not been welcomed in full swing in the country. Full divestment of state enterprises is almost beyond imagination as the public sector is seen by most Emiratis as the ultimate employment avenue (Mansour 2017; Ryan 2016). Despite this, some other forms of privatization such as outsourcing, franchise, partial divestment, public-private partnership and the proliferation of government-linked companies have been in place for quite some time (Khalid et al. 2015; Uddin et al. 2014). Particularly, outsourcing and public-private partnerships (both local and international firms) are moving in rapid pace. The number of government-linked companies listed in the stock market has also increased, and their performance is very good. Probably, this is one of the reasons for continued involvement of the government in business (Mansour 2017; Uddin et al. 2014). Reforms have been implemented in the areas of financial market, labor market, corporate governance, competition, intellectual property rights, consumers' rights protection, and so forth (Khalid et al. 2015).

The UAE is one of the countries in the world which has demonstrated efficiency in streamlining the business regulatory system. Two global reports state the regulatory system in the UAE. The Global Competitiveness Index has ranked the UAE at 17 out of 140 countries in the world. According to the World Bank's Doing Business 2018, the UAE ranks 21 among 190 countries in terms of several parameters including starting a business, dealing with construction permits, getting electricity, registering property, getting credit, protecting minority investors, paying taxes, trading across borders, enforcing contracts, and resolving insolvency.

Civil society as the phrase implies has never existed in the UAE largely because of the traditional structure of society. Nevertheless, over the last two decades or so, there has been some flexibility as civic groups can work under government surveillance. Private associations have to have license from local authorities. The first civil human rights society in the country was officially decreed on February 21, 2006. Most members are from the professional groups. Full membership is restricted to citizens; expatriates can have just affiliate membership.

Trade unions are not allowed to operate. The Federation of UAE Chambers of Commerce and Industry and the UAE Women's Federation are officially recognized who play an active role in

their spheres of operations. The UAE Women's Federation has been quite active in teaching local women to organize themselves, set up literacy campaigns, establish craft and vocational centers, and, thus, prepare women to play an active role in social development.

Although the Constitution provides for freedom of speech, the media avoids direct criticism of the government. All television and radio stations conform to government reporting guidelines. Satellite receiving dishes are widespread and provide access to international broadcasts without apparent censorship. The UAE has adopted an incremental approach in relation to civil society.

Philanthropy has always been active in this part of the world. Historically, the well-off section of the population has extended their helping hands for social causes. But since the legislation of 2008, NGOs have proliferated immensely in developmental and humanitarian activities. Under the law of 2008, all NGOs have to register with the Ministry of Labour and Social Affairs. The Federal government provides grants to well-performing NGOs to carry their activities. As per NGO registration rules, all voting organizational members, as well as boards of directors, must be Emiratis. Foreigners can only be associate members. Domestic NGOs registered with the ministry are mostly citizens' associations meant for social, religious, cultural, scientific, educational, professional, feminine, innovative, or an artistic activity or provision of humanitarian services. The society and its members are prohibited to interfere in politics or in the matters that impair the state security or to arouse sectarian, racial, or religious disputes (Sarker and Al Athmay 2017).

## Federal Civil Service

The current system of Federal civil service is run on the basis of the new Federal Law that was promulgated in 2008 which was further amended in 2011 (FAHR 2008). Immediately after independence, the Federal government enacted the law No. 1 of 1972 that laid the basis for civil administration. A new law was further enacted in 2001. But the law of 2008 reflects the modern ethos of civil service. The Federal government enacted this law in order to make the civil service system highly efficient, effective, and innovative. Civil servants work across 17 Ministries and 32 independent government authorities. The new law has ensured a decentralized system and introduced professionalism in civil service.

### Manpower in Civil Service

See Table 1.

### The Grading System for National Employees in the Ministries and Authorities

The Federal civil service system follows the grading system. Different grading systems are followed for different types of entities and nationalities. The civil service posts are classified into three groups, and each group is divided into grades, the total of which is 14.

Grades 1 and 2 belong to group I. *Senior-level positions* including Undersecretary, Assistant Undersecretary, Special A, and Special B. Group II includes the middle-level jobs which are divided into four grades (3–6). Group III contains t*he executive-level jobs (grades 7–14).*

For non-national employees in the Federal Ministries and authorities, there are four groups. Group I, the senior level, includes grades 1 and 2. Group II, the middle level, contains grades from 3 to 6. Group III, the executive level, covers grades from 7 to 10. Group IV comprises grades from 11 to 14 which fall with the supporting level.

There are separate grading systems for national educational staffs in the Ministry of Education. For national employees, group I, the teaching staff category, has four grades (1–4). Group II, the school administrator category, comprises four grades (1–4), the educational activities category (group III) four grades (1–4), and the educational

**Public Administration in the United Arab Emirates: Continuity and Changes, Table 1** Type of authority

| Entities | No. of employees |
|---|---|
| Ministries | 52,066 |
| Independent authorities | 31,668 |
| Total | 83,734 |

Source: Sarker and Al Athmay (2017)

development category (group IV) four grades (1–4).

For the medical profession for the nationals, there are three categories of jobs: medical doctors (grades 1–4), medical technicians with higher qualifications (grades 2–4), and medical technicians without higher qualifications (grades 2–12).

The judicial system has also a separate grading system for nationals and non-nationals. For nationals, there are seven brands including the top brand for the chairman of the Federal Supreme Court, Undersecretary of the Ministry of Justice, and Attorney General. There are six bands for non-national employees in the judicial service.

The Federal government of the UAE is committed toward Constitutional obligations for gender parity in the civil service system. Table 2 reveals participation of women in Federal government civil service.

### Gender

Though at this moment, gender balance is not up to the mark, the affirmative action plan embodied in the UAE National Strategy for Women Advancement (2002–2014) is expected to enhance women's participation. At present, women hold around 30% of the senior jobs related to the decision-making process and 10% of the jobs in the diplomatic corps.

In some traditional areas, women employees are clearly dominant in both the national and expatriate communities. For example, 100% of nursery schoolteachers, 55% of primary schoolteachers, and 65% of intermediate and secondary schoolteachers are women. UAE women comprise over 40% of all employees in education, at least 35% work in the health sector and approximately 20% in social affairs. One out of every three doctors, pharmacists, technicians, and administrators is a woman, as is over 80% of the nursing staff. The government is generous in granting the concerned employee a permanent job with a total salary of maternity leave for 2 months. There are also other benefits once the period of 2 months is over (Sarker and Al Athmay 2017).

**Public Administration in the United Arab Emirates: Continuity and Changes, Table 2** The number of employees in the federal government in the year 2013 second quarter

| Gender | No. of employees |
|---|---|
| Female | 32,138 |
| Male | 51,596 |
| Total | 83,734 |

Source: Sarker and Al Athmay (2017)

### Emiritization

The most contentious issue is emiritization since a large number of expatriates are employed in the Federal Ministries and independent authorities. In recent years, the government has been under pressure for more intake of local citizens as every year new graduates are coming to the job market. Historically, local citizens have always preferred government jobs to private sector jobs since the latter are no comparison to the former in terms of salary, benefits, working hours, facilities, and career prospects (Ryan 2016). Though the policy is not a new one, it received increased attention in the new millennium. One set of estimates suggests that by the end of 2010, in the Federal Ministries, the number of expatriate employees constituted 33% and national employees 67% (Sarker and Al Athmay 2017).

## Human Resource Management Practices in Federal Civil Service

### Central Personnel Agency

While major human resources functions have been assigned with the Ministries, the Federal Authority for Government Human Resources was established to act as a supervisory body and entrusted with the public competencies and liabilities related to the management of the human resources of Ministries and Federal organizations (FAHR 2008). It is entrusted with the following functions:

(a) To study and propose policies and legislations related to public human resources
(b) To assist Ministries to adequately execute human resource management-related policies and legislations

(c) To monitor whether the Ministries and independent authorities comply with the intents of human resource law
(d) To look into the objections against the decisions of Complaints Committee of the Ministries (FAHR 2008)

### Recruitment

The vacant positions in every ministry are filled in accordance with the following types of employment: full time, part time, temporary, and contractual. There are several conditions of public positions that have to be fulfilled. These include good reputation and conduct, at least 18 years of age, required academic and professional qualifications, successful passing of all examinations and interviews, medical fitness, no criminal records unless pardoned or rehabilitated, clean record of previous services, and no final judicial judgment in a crime.

The law provides elaborate provisions for part-time contract job. The Minister assumes the authority for such appointments. In most cases, special part-time contract jobholders receive a total lump sum monthly salary without any other benefits that are accrued to full-time positions. Such appointments are normally made for 3 months and can be regularized by following the proper procedures. The Minister has also the authority to appoint any distinguished expert required by the ministry for a stint of 2-year contract, renewable for another 2 years. The appointment to posts of Undersecretary and Director General in independent authorities is made by the Minister based on approval of the Cabinet.

All new appointments except the posts of Undersecretary and Director General of independent authorities must undergo for a probationary period of 3 months which can be extended for a similar period after which the evaluation of performance will be made by the immediate Superior in accordance with clear basis, and in the light of outcome of this assessment, his service is either permanent or terminated. Transfer is another means for filling up vacant positions within a ministry or to other Ministries.

### Promotion

There are two types of promotion in the Federal government civil service: work promotion and financial promotion. There are several methods of promotion – promotion to a vacant position, promotion to a new position created which has redistributed responsibilities and obligations purposes and requires a higher degree, and promotion to an employee considered suitable based on performance report. An employee is granted a financial promotion not exceeding 10% of the basic pay upon the approval of the Minister.

### Remuneration

As per the Federal government law No. 11 of 2008, all Ministries must have a unified scale of degrees and salaries. The following principles are following while determining compensation of the employees:

1. Each job has the degree prescribed and the determination of the degree is connected with the job.
2. The employee has the two tracks – the first known as "administrative track" and the second track is known as "professional of technical track," and each of them has special classification as per the type of job.
3. Approval of total salary.

However, the decision of the Cabinet determines the minimum total salary for UAE national employees provided that the same should be reviewed when deemed necessary. It is worth mentioning here that compensation and associated benefits vary substantially in accordance with the grade the employees belong to and the type of residency (national or non-nationals).

### Training

Training is an essential ingredient of Federal civil service. The government has emphasized on the trained qualified human resources, particularly UAE national employees, and developing their knowledge and job skills required for the current positions or the future positions they might be given.

Elaborate procedures are followed by the Ministries in developing and executing the annual training plans. It should be mentioned here that the intents of these training plans have to be compatible with the strategic priorities of the government. The Ministries undertake initiatives to analyze the training and development needs through such means as annual performance appraisals, managers' appraisal reports, and the employees' own assessments.

Apart from specialized job-related training offered by different government different training institutes, the Ministries also sponsor UAE National Higher Secondary Grade Graduates to study some technical and professional programs. Scholarships are also provided to deserving employees to pursue postgraduate programs.

## Performance Management

Performance management in the UAE Federal civil service is grounded on two levels: the employee performance management system (EPMS) and the government performance management system (GPMS).

First, the EPMS signifies a process for establishing a shared workforce understanding about what is to be achieved at an organization level. It is about aligning the organizational objectives with the employees' agreed measures, skills, competency requirements, development plans, and the delivery of results. The system is practiced in accordance with the UAE Federal Decree (FAHR 2008) of the UAE Federal Government Human Resources Law. The underlying importance of EPMS is putting in place a performance management system for the human resources of the UAE Federal government for benefiting both the government and its employees. The Federal Authority for Government Human Resources (FAHR) undertook the responsibility of creating an employee appraisal system that would become a basic reference for all Ministries and Federal entities enabling them to manage the performance of their employees. The approach essentially underscores the necessity of fostering a performance-oriented culture, participation of employees in the goal setting process, and establishing a clear connection between on-the-job performance and incentives (FAHR 2017).

Second, under the GPMS the unit of analysis is not measuring the employee performance; rather it is the establishment of global standards for improving the services provided by the public sector to the citizens. In 2009, H.H. Sheikh Mohammed bin Zayed Al Nahyan signed a decree requiring all Federal entities to apply best practices to raise overall performance to higher levels of excellence and ensuring national dignity and happiness and wellbeing for its citizens. His Highness (cited in MoCAF 2018) said that:

> Developing the performance of government departments, institutions and agencies is a strategic objective of the Government in order to position itself as a global leader in government performance in line with 2021 UAE vision concerning modernization and development to deal with the requirements of the overall development boom and its responsibilities in the new millennium.

The GPMS consists of four main pillars:

1. Managing the performance of national indicators for measurement of the extent to which UAE Vision 2021 is achieved
2. Evaluation of government efforts to achieve the national priorities
3. Managing the performance of government enabler indicators for customers and human resources and those related to smart government and e-government strategies
4. Managing government entities in terms of indicators of strategic objectives stated in their strategic plans

The GPMS requires from all departments to establish performance targets and performance indicators that can be used as standards for measuring actual progress of the departments' performance. To facilitate this process and to provide feedback on the actual performance, the departments are required to hand quarterly progress reports to the performance and evaluation division of the General Secretariat Executive Council. Providing feedback as interpreted by government higher officials is not meant to punish the public

Civil servants if they fail to meet their targets. Instead, they, say, they are about building the culture of performance-driven organizations (MoCAF 2018; FAHR 2017).

## Public Budgeting in Civil Service

The system of government plus the short time span of the budget facilitated the domination of incrementalism in the budgetary decision-making process until end of the twentieth century. The formal and informal structures which go hand in hand have made the system highly pluralistic and complex. The informal networks of patron-client relationships are integrated with the formal structure and pose considerable constraints on the Federal budget especially in the areas of services and employment. In addition, as Mansour (2010) observes, the short time span given to various Federal departments in the preparation of their estimated requests coupled with start of the fiscal year in January has contributed to the lateness of the endorsement of the budget on time (cited in Sarker and Al Athmay 2017).

The first serious attempt to reform the budgetary system, performance-based budgeting (PBB), came in 2001 with the technical assistance of the United Nations Development Programme (UNDP). It was more like program budget described in the literature. There was planning orientation focused on setting objectives, developing programs and subprograms with clear statements, developing performance indicators, and so forth. The approach is consistent with the precepts of the new public management (NPM) model that became very popular all over the world since the 1980s (Mansour 2017). In line with implementation of PBB, attempts were taken to integrate PBB with other managerial practices. As part of the quality management program, all Ministries were required to develop annual performance plans and annual budgets and were to be linked with strategic plans. The development of these plans and the strengthening of management practices are essential to the success of the wider public finance reforms.

In 2008, a medium-term (3-year) budget was implemented until the medium-term zero-based budget (ZBB) was adopted in 2011. It was adopted to ensure more transparency and provide flexibility in the implementation of various programs. The Ministry of Finance appointed the Boston Consulting Group (BCG) to help design the core concepts of ZBB. The Classification of the Functions of Government (COFOG) and an automated system have also been integrated with ZBB. The MoF has adopted a 5-year ZBB for the term 2017–2021.

The MoF (2018) has clearly stated that Federal budgeting must be prepared based on six major elements complying with international best practices. These six elements are:

- Alignment of the budget with government strategy through program budgeting and performance monitoring
- Seamless integration of annual budgets in 3-year budget cycles
- Definition of sectoral spending targets and ministry/autonomous agencies' budget caps by the Financial and Economic Committee
- Elimination of unjustified vacancies
- Integration of CAPEX and OPEX budgeting
- Application of zero-based budgeting

According to the MoF (2018), ZBB:

> Starts from a "zero base", analysing every function within an organisation regarding its needs and costs. Budgets – within the limits of budget caps – are then built around what is needed for the upcoming period, regardless of whether the budget is higher or lower than the previous one. It provides bottom-up costing for performed activities. The budget is based on the costing and prioritisation of activities, as well as the optimal use of resources.

There is lack of empirical research on the UAE Federal government budgetary system. In an earlier research, Mansour (2010) examined the style of decision-making and its impact on annual estimation of public expenditures. He found that the decision-makers in UAE Federal Ministries used an incremental style in estimating the annual expenditures in spite of the fact that PBB was in place (cited in Sarker and Al Athmay 2017).

However, some global indicators reflect effective and efficient use of public money in the UAE Federal government. For instance, the MoF (2018) has mentioned that the UAE secured the first place in Public Finance Policies Index in 2015. The country also achieved the first place in government efficiency and good management of public finances, according to the World Competitiveness Yearbook 2014.

## Strategic Management in Civil Service

At present, the UAE is viewed as one of the most innovative and outstanding government practices in the world. The UAE government is regarded as being one of the principal investing governments in the adoption and implementation of smart initiatives in its private and public sectors. As per the Federal government law No. 11 of 2008, the Federal system has been revamped. The initiative to practice strategic management in UAE has become regular and standard and can be considered the centerpiece of reform in UAE public sector organizations. According to Elbanna (2013), strategic management endeavors in both the Federal and local organizations have become a must practice and bring a lot of benefits to the UAE modernization efforts. In this competitive world, public sector efficiency cannot be enhanced with adopting strategic management practices. Empirical evidence gives positive results in terms of relatively successful implementation of strategic plans (Elbanna 2013) (Table 3).

## Public Service Delivery Through the Integrated System of Total Quality Management (TQM), Business Process Reengineering (BPR), and Information and Communication Technology

Public service delivery has been the cornerstone of the reform agenda of UAE public administration. The Federal Decree of 2008 (FAHR 2008) laid the foundation for the transformation of the administrative system that would bring in fundamental changes in the service delivery system. The subsequent national policies further reinforced the government's commitment toward citizen-centric public service delivery. The UAE Vision 2021 envisions that the Emiratis will have world-class public services. In order to realize the vision, some critical elements of the NPM model have been adopted and implemented. In the preceding sections, elaborate discussions on revamped human resource management practices and strategic management have been elaborated. This section reflects on the three critical innovations in public service which have immensely impacted the service delivery system (Mansour 2017).

**Public Administration in the United Arab Emirates: Continuity and Changes, Table 3** Strategic process capabilities (Hertie School of Governance 2014)

| Country | Rank | Total score | Long-term strategic visioning | Ensuring government coordination, integration, and coherence | Mobilizing public authorities and public and private stakeholders behind the long-term strategic vision | Evaluating strategic action policies and adapting | Government effectiveness estimates |
|---|---|---|---|---|---|---|---|
| Denmark | 1 | 6.56 | 1.32 | 1.71 | 1.64 | 1.89 | 2.1 |
| United Kingdom | 2 | 6.55 | 1.07 | 1.95 | 1.64 | 1.89 | 1.6 |
| Germany | 3 | 4.96 | 1.57 | 0.90 | 1.64 | 0.089 | 1.6 |
| Sweden | 4 | 4.76 | 1.07 | 1.14 | 0.66 | 1.89 | 2.0 |
| Singapore | 5 | 4.62 | 1.11 | 0.95 | 1.15 | 1.41 | 1.8 |
| UAE | 6 | 3.96 | 1.57 | 0.38 | 1.64 | 0.37 | 0.9 |

Source: Joyce and Al Rasheed (2016, p. 136)

Political leaders in the UAE have supported the introduction of TQM in government institutions. The Dubai government led the way in this endeavor. The UAE Government Strategy 2008–2010 unequivocally highlighted the importance of quality public services which was further reinforced in Highlights of the UAE Government Strategy 2011–2013, National Innovation Strategy (Rahman et al. 2016), and UAE's Fourth Industrial Revolution strategy. The efforts toward achieving quality public services are reinforced by the Sheikh Khalifa Government Excellence Program at the Federal level. Similar programs are also in place at the local government level (Ahrens 2013).

BPR is another managerial innovation widely practiced in the UAE public sector. BPR is a system that produces a given output or delivers a given service at stipulated time and affordable cost. It combines several processes. In fact, empirical evidence suggests that BPR has had considerable impact on improving the service delivery system to a great extent by replacing many unnecessary bureaucratic hurdles (Ahrens 2013; Rahman et al. 2016; Sarker and Al Athmay 2017).

ICT has enormously contributed to reap the benefits of TQM and BPR. The use of ICT in government, popularly known as e-Government, has radicalized the service delivery system in the UAE. E-Government was first launched in the UAE in 2001 with the aim of transforming all government services and making them available 24 h/7 days a week. The e-Government strategy consisted of three main categories: e-Services (the provision of high-quality electronic services through various channels to meet customer needs), e-Readiness (a focus on strengthening the capacity of Federal agencies in terms of technology, organization, and human resources), and the ICT environment (covering organizational factors such as infrastructure and regulatory policies) (Rahman et al. 2016).

The Global Information Technology Report 2010–2011 indicates that UAE leads the Middle East and North Africa (MENA) region in leveraging ICT for increased economic diversification and competitiveness (Al Athmay 2013). In addition, the latest United Nations report confirmed that the growing efforts of the UAE government to promote digital transformation and literacy have helped further enhancement of the country's ranking (Sarker and Al Athmay 2017).

In regard to the e-Government and the Online Service Indexes, the UAE ranked second behind Bahrain in the MENA region (Al Athmay 2013) (Table 4).

Application of the above-discussed critical tools in the public service delivery system has resulted in certain tangible benefits. According to the World Bank's Worldwide Governance Indicators, the performance of the UAE government is very impressive in certain areas. The Emirates Identity Authority is a case in point. Al Khouri (Al-Khouri 2013) reports that the combined efforts of strategic management, performance management, TQM, BPR, and ICT helped the authority to become one of success stories of innovation in the world in recent years. In terms of cost optimization, savings exceeded AED 500 million. In this regard, augmented capacity and application processing capabilities increased by 300%. In the case of process efficiency, there was cost reduction of 8 dollars per application. Five million applications were processed in 1 year. Most importantly, customers' experience improved significantly once process and workflow automation enabled the development of numerous self-service models.

## Ethics in Public Administration

The UAE government is committed toward the development of an ethical public administration system. The UAE government has deliberated extensively on ethical behavior of civil servants. The government in 2010 adopted a resolution of Ministerial Services No. 1118/g/9. In the front page of this resolution, the government outlined the civil servants' responsibility. It states: "civil service jobs shall be a national service entrusted to those who hold it. The public servant shall aim, in the execution of his duties, at the public interest alone." All Ministries and Federal entities are required to adopt this document and develop a detailed ethical standard in accordance with the

**Public Administration in the United Arab Emirates: Continuity and Changes, Table 4** World e-Government leaders with very high development index (EGDI)

Source: Sarker and Al Athmay (2017)
EGDI is a composite index that measures countries' e-Readiness on three components (online service, human capital, and telecommunication infrastructure indexes)

nature of their work. The Ministerial resolution clearly observes:

> The Code of Ethics and Professional Conduct for Civil service is defined as public servants performing their duties faithfully, objectively and with integrity, and who work constantly to achieve the objectives of the entity they work for. It also means that they should perform their duties within the limits of the powers granted to them, and to do so in good faith, without any ill-intent, negligence, violation of any laws, or harming public interest to achieve any personal interests for themselves or others (FAHR 2010, p. 9).

The government strongly believes that certain core values enhance the performance of the government sector as a whole. Proper application of

these core values also brings for public servants the respect of their superiors, colleagues, and members of the community. These core values are excellence, diligence, integrity, honesty, objectivity, neutrality, alertness, efficiency, leadership, transparency, fairness, and equality. On the other hand, the Federal government is also committed to fulfill its obligations toward the employees and provide all support services and incentives to employees to ensure ethical and professional standards in public service. The rule of law is one among the most important ingredients of good governance in any country. Therefore, it will not surprise any individual when he/she reads a report ranking UAE among the high perming countries in the world (see Table 5).

One important measure of the presence of high ethical standards is the reduced level of corruption. The UAE government's commitment toward curbing corruption is further reflected in the latest Corruption Perceptions Index (CPI) of the Transparency International. The UAE ranks 21 in the world and the best among the Arab countries. The UAE has the anti-bribery legislation since the late 1980s. There is a plethora of laws, rules, and regulations in curbing corruption practices in the UAE.

Bribery is a criminal act in the UAE according to articles 234–239 of the UAE Penal Code, Federal Law No. 3 of 1987 (the Federal Penal Code). The Federal Penal Code applies to the UAE as a whole. The Emirate of Dubai also has its own penal code, namely, the Penal Code 1970 (Dubai Penal Code). There are two additional laws – Federal Decree Law No. 11 of 2008 (also known as the "Federal Human Resources Law") and Dubai Law No. 37 of 2009, which are directly related to bribery. More precisely, these are financial fraud laws on the procedures for the recovery of illegally obtained public and private funds (Laubach 2016). These laws are quite robust in scope, at the same time very specific. As such, any matters relating to conflicts of interest and gift-taking would be considered as illegal in the eyes of law.

UAE is one among 46 countries with Anti-Corruption Regulation. It ratified the United Nations Convention against Corruption and in pursuant to Federal Decree No. 8 of 2006 (Laubach 2016). Nevertheless, the experts from UN Convention against Corruption suggested that for the UAE to win the gains from Anti-Corruption of 2006 is to include ways of protecting informants and witnesses who report graft. Despite this, the UAE has achieved remarkable progress in fighting corruption. It has elaborated institutional frameworks and their enforcements. The government's vigilance over corruption practices manifests in unfolding high-profile cases related to bribery and conflicts of interests (Laubach 2016).

**Public Administration in the United Arab Emirates: Continuity and Changes, Table 5** Governance indicators of the UAE

| Indicator | Year | Governance score (−2.5 + 2.5) | %ile rank (0–100) |
|---|---|---|---|
| Government effectiveness | 2006 | 0.94 | 79.51 |
| | 2016 | 1.41 | 90.87 |
| Regulatory quality | 2006 | 0.63 | 70.10 |
| | 2016 | 0.97 | 80.29 |
| Rule of law | 2006 | 0.32 | 60.77 |
| | 2016 | 0.89 | 79.11 |
| Control of corruption | 2006 | 0.89 | 79.02 |
| | 2016 | 1.28 | 88.86 |

## Concluding Remarks

Public administration in the UAE started its journey in 1972 and has confronted stupendous challenges to reach the current state of a viable system. Like other developing countries, the foundation of the UAE administrative system was built upon the Weberian bureaucratic precepts. For almost three decades, the bureaucratic system maintained status quo. The accelerated pace of globalization, the volatile oil prices, and the financial crises in the period 2007–2010 tremendously influenced the UAE government in quest for an efficient and effective public administration. While most of the regional countries have wasted time debating on political discourses, the UAE government has focused on maximizing efficiency and

effectiveness of public administration. At the policy level, economic liberalization, deregulation, and massive economic diversification were undertaken. This chapter has clearly shown the firm determination of prudent political leadership reflected in numerous strategic documents including the UAE Vision 2021.

The UAE government took cognizance of the global developments in public administration. It took a cautious approach in selecting the elements of the good governance and the NPM models which could be implemented without radical disruption in administration and society. While the neoliberal market model pleaded for market-led governments, the UAE government has proven the efficacy of government-led market. The efficient performance of government-owned enterprises and government-linked companies has ascertained that governments can do business. On the other hand, it has provided business-friendly climate for local and international capital. Corporatization, outsourcing, strategic management, performance management, TQM, BPR, ZBB, and use of ICT have been implemented with relative success. The innovative application of all these selected tools has resulted in upgrading the competiveness of the UAE government and the efficiency of the public service delivery system.

This chapter provides some lessons for other developing countries. The critical enablers of the transformation of public administration include prudent political leadership and its critical policy choices and alliances with competent stakeholders, infusing strong and proactive organization culture and results-producing incentive structure.

# Public Administration in Turkey

Yılmaz Üstüner and Nilay Yavuz
Department of Political Science and Public Administration, Middle East Technical University, Ankara, Turkey

## Synonyms

Turkish bureaucracy; Turkish governance

## Definitions

*Turkish Public Administration*: Administration of public sector, which is consisted of the central administration units, their extensions at the local level and local government units.

*Turkish Bureaucracy*: Administrative practices and the organization of approximately 2,430,000 public servants employed by the public sector in Turkey.

## Introduction

This entry is an introduction to current public administration structure and practices of Turkey. First, a background information is provided about the characterizing features of the nation and the society. This is followed by the description of structural elements of the current public administration system, which is highly dynamic, on the one hand, but also is an amalgam of many traditional and modern aspects, on the other. As the result, system has been displaying hybrid characteristics of being "autopoietic"; mainly because of the inheritance of an established administrative legacy inherited from almost 600 years of Ottoman rule and being modern, articulating to global neo-liberal currents by adapting universal (new) public management administrative practices. The last part is on the challenges of the existing system, which are classified as high politicization, need for better participation and governance, problems about human resource management in public sector, and a need for new perspectives and practices of administrative reform.

## Background

Located on two continents – Asia and Europe (Balkans) – Turkey has an area of 783.562 square kilometers including the surrounding seas, 97% of which is in Asia (Anatolia). Therefore, Turkey has long held a strategically important geographical position, being a gateway, crossroads, and passage from West to East and vice versa.

Modern Turkey is a democratic and secular Republic, proclaimed in 1923. This followed, first, the defeat of Ottoman Empire, which existed for approximately 600 years, and then its "war of independence" (1919–1923) against allies (including Greece, Armenia, France, UK, and Italy). Proclamation of the Republic was immediately followed by reforms based on Western ways of life, with structural models imported from many continental European countries. Turkey today is "a member of almost every Western European international organization"

(Kapucu and Palabıyık 2008, p. 47) and has a long history to become a member state of European Union, officially applied for in 1987. On the other hand, Turkey never totally abandoned the traditional sociocultural characteristics inherited from the Middle East and Ottoman Empire. This duality is visible in many areas of the society and the social life, the state and public administration are no exceptions.

Turkey has a population of 80.81 million as of 2017 (Turkish Statistical Institute 2018). This makes it the third populous country in Europe, following Russia and Germany. The annual population growth figure for 2017 is 12.4% and the projection made by Turkish Statistical Institute for the year 2025 is approximately 88 million people (Turkish Statistical Institute 2018). Distribution is not even 92.1% reside in provinces and subprovinces, whereas 7.9% live in towns and villages. Also, 18.59% live in Istanbul province, having a population of 15,029,231 (Turkish Statistical Institute 2018). Uneven geographical and settlement distribution of people beings forth certain difficulties in organizing the provision of public services especially in respect to material and human resources allocation.

The labor force in Turkey is 30,778,000 (June 2016), of whom 10.3% are unemployed (Turkish Statistical Institute 2018). Unemployment of the younger generation (15–24 years old) is even higher at 19.4%. This rises to 30%, if the many young people who are in education and training are omitted, which is the highest rate among OECD countries (OECD 2016). General unemployment issue and unemployment of the younger generation force them to look to the public sector for new jobs, despite the prevailing neoliberal public administration practices in the last approximately 25 years having the objective of downsizing the public sector. The relatively higher rate of unemployment is not consistent with the economic growth in Turkey. Turkish free-market economy has a GDP (in purchasing power parity) of $US 2.133 trillion, which makes it the 14th big economy in the world (CIA 2016). Since the 1980s, Turkey's growth has been either in par or exceeded its peer group (i.e., new member states) and accession candidates of EU, BRICKS, growth markets, and MENA countries (The World Bank 2015). Despite the economic wealth and growth, relatively uneven distribution of income constitutes one of the most important socioeconomic problems. The Gini coefficient by household disposable income figure is 0.397 (OECD 2016). As the result, the highest 20% income-level group in Turkey receives 46.5% of the total income in 2015, which rises to 68% when the highest 40% income group is considered. The lowest 20% income group receives only 6.1% of total income, and, as the result, 15.8% of the population remain below the poverty line between 2012 and 2015 (Turkish Statistical Institute 2018). The reducing of income inequality and the poverty, without threatening the pace of economic growth, is another challenge for the state and the public administration.

Turkey has a democratic parliamentary system and its fundamental political structure is in accord with its 1982 Constitution. This clearly states that "the Republic of Turkey is a democratic, secular and social state governed by rule of law" (Article 2) and that it is "an indivisible entity" (Article 3). Based on the principle of the separation of powers, the legislative power is vested in the Turkish Grand National Assembly; the executive power in the President of the Republic and the Council of Ministers; and the judicial power rest in independent courts. However, strong central administration tradition and supremacy of politics over bureaucracy pose some threats to the exercise of this principle. There is overlapping of powers, and the public bureaucracy is under very strict scrutiny and control of the political authority.

On April 16, 2017, a referendum was made for 18 constitutional amendments proposed by governing Justice and Development Party (AKP). "Yes" votes were counted as 51.41% against 48.59% "no" votes. Except one, all of the amendments will be put into effect by the end of 2019. The most important of these will be about the position of the President, transforming the political system into a "presidential system," where there will be no Prime Minister but much

more Presidential authority and powers. This would likely to increase the centralization of the state and public bureaucracy and supremacy of politics over these.

## Public Administration System

Currently in Turkey, central administration is consisted of both central administrative institutions, such as the Prime Ministry, Ministries, and other agencies located in Ankara (the capital city) and provincial administration (81 provinces and 919 subprovinces). These are formed according to the prevailing geographical situation, economic conditions, and the public services. Provincial administration is based on the principle of the de-centralization of powers, but, in a sense, it can be considered as the extension of central administration down to these localities. Local administration consists of municipal, village, and special provincial administration. Local administration units operate under administrative tutelage of the central government. Their electorate elects their senior administrators and council members every 5 years. Currently, 30 of 1397 municipalities are metropolitan and there are 18,332 villages. However, "the distribution of tasks between central, provincial and local administrations in terms of effectiveness, efficiency and democracy in services has not been successful to date. The result is a bulky structure and red tape bureaucracy" (Kapucu and Palabıyık 2008, p. 109).

Turkish public administration system has been subject to many reform initiatives since the proclamation of the Republic. Major reform campaigns took place in 1963, 1971, 1980, 1989, and 2000. Those campaigns were sporadic and aimed at specific aspects and levels of the system. Most were made with the objectives of increasing the effectiveness and efficiency and resulted in highly similar diagnosis and recipes about the problems of the system as a whole. These reforms have been basically limited with the structural elements of the system, especially on the reorganization of institutional-organizational aspects. Starting in the early 1980s – parallel to global currents – Turkish public administration system was subjected to new reform discourse based upon agendas aligned with neoliberal public sector reform and later, New Public Management practices. These included privatization, downsizing, de-regulation, and the adoption of business management practices. The traditional characteristics of public administration – such as centralism, political control, and interference, resistance to change – imposed many constraints on the full and fast implementation of administrative reform. Also, the direct application of reforms grounded in foreign practices, without adjusting them to local conditions, demands, and culture, is the source of many reform implementation problems.

From the mid-1990s – again following global trends – the Turkish state began to make structural rearrangements for the implementation of "regulatory state" phase of neoliberalism. Under the guidance of main tenets of the New Public Management and the neoliberal understanding of governance, a number of independent regulatory authorities or higher councils of regulation had been established. Most of these are operational today and are in charge of regulating many areas of market and social life (ranging from mass media to competition in the markets, energy sector, public procurements, and finance sector and banking). However, the prevailing culture of strong political control also negatively influences these institutions and hamper their alleged "technical" and "neutral" regulation functions.

The current 1982 Constitution of Turkey states that the fundamental and permanent functions required by the public services that the state and other public institutions are assigned will be carried out by public servants and other public employees who are obliged to carry out their duties with loyalty to the Constitution and laws (Articles 128 and 129). The Law of Public Servants (Law 657 of 1965) still regulates the fundamental provisions of public employment. It has some stipulations inherited from the Ottoman Empire and has been amended many times. Indeed, the currently fragmented and highly complex legal-structural system for civil service has emerged because different employment categories and methods involve different laws (including

many governmental decrees). Management of this complex system, consequently, is also a challenging task. Public employment affairs are regulated both at the central and local levels. Subordinated to Ministry of Labour and Social Security, the State Personnel Presidency is in charge of preparing personnel policies, determining overall personnel needs of the system and conducting research on the betterment of public personnel employment. However, the Ministry of Finance is also powerful in this respect. This duality necessitates close collaboration between these two agencies but, in practice, it is not perfect. Almost all the other public institutions, either central or local, have their own specific personnel departments. There is also an ongoing reorganization plan for these units to change their names from Personnel Departments to Human Resources Departments and assigning them roles and tasks in parallel with the New Public Management perspective. However, lack of legal-structural reform about the regulation of civil service centrally hinders this transformation.

Public employees in Turkey are divided into four broad categories, under the 1965 Law of Public Servants, according to their expert and/or service areas. These are administrative (civil servants), judiciary, academic, and military. Further, they are classified as civil servants who hold permanent positions in any public agencies. These are 2,430,101 in number as of March 2018 (Turkish State Personnel Presidency 2018). Judiciary, including judges and prosecutors working in different judicial agencies are 17,467 persons. Academic personnel includes 131,171 scholars who work in 114 public universities and other public higher-level education institutions. Military personnel, excluding soldiers undertaking compulsory military service are 241,560 persons (May, 2016 figure) (Turkish State Personnel Presidency 2018). Other than these, laws allow employment of contracted personnel, temporary (seasonal) personnel, and laborers hired on temporary or permanent basis. As of March 2018, 530,727 personnel are employed under these three categories. Total number of civil servants, excluding military, is currently 3,129,304 (Turkish State Personnel Presidency 2018).

In principle, recruitment of public employees is made through central entrance examinations, which were made mandatory 1999, augmented by local exams and interviews carried by specific institutions to which the candidates have applied. In general, public officials work under the principles of carrier, merit, equality, and impartiality (Kapucu and Palabıyık 2008, pp. 209–210). Although these are generally observed in practice, strong political control and centralization pose problem here as well. Political control is especially evident with respect to the appointments of senior officials. Although senior officials have the status of civil servants, their appointment and dismissals are political, not based on merit system following transparent competition. Such positions number approximately 7000 (OECD 2015, p. 49).

## Challenges Facing the System

There are mainly four broad categories of challenges facing the Turkish public administration system: politicization, governance, human resource management, and administrative reform.

The over-politicization of public administration: Control by the political party in power over the public administration system is one of the most important threats facing public administration in Turkey. Due to the requirements of the separation of power principle and of democracy, it is natural for government to want to eliminate potential resistance to political authority over the bureaucracy. However, elimination of such resistance should not mean the adoption of very strict hierarchical control over the bureaucracy by the party in power. Such direct control and intervention threatens the expertise of the bureaucracy and the survival of the merit system, which would compromise and hinder the quality, efficiency, and effectiveness of public services. This control and intervention are especially problematic with respect to appointments to higher-level positions, because it eliminates both the distinctions between political and administrative leadership and the competitive process for such appointments that makes them merit-based. Moreover, the politicization of the Turkish national bureaucracy

means the politicization of all levels of public administration. Currently, Turkey is debating a new Constitution and transformation into a presidency system. If this is realized, there is the probability that this issue would become even more problematic in the future.

Governance and the broadening of participation in public policy and administration: Participation, transparency, and accountability are three interrelated pillars of a good governance process. Turkey has done a lot to enhance its governance arrangements, especially in the last decade, as a consequence of pressures from outside (such as from EU and other international organizations) and/or demands from inside. These have always been matters of consideration with priority in government programs, plans, and strategies. Accordingly, many legal-procedural arrangements have been made to establish and sustain these principles as common practices of bureaucracy and more can be expected in the future. However, the key issue is their implementation. Turkey still has problems of participation in governance processes, both from outside (civil society) and inside (members of bureaucracy). The willingness of the public administration system to be open and to facilitate broader participation in policymaking and implementation processes is remarkable but not adequate. Stakeholders should also demand a greater governance role and, more importantly, should evidence their zeal and willingness to participate in governance processes. Despite high politicization being a traditional characteristic of Turkish society, there is a doubt about the willingness of stakeholders to participate in governance processes. In this respect, local governments are important means of participation, but the over-exercised administrative tutelage of the center and their strict monitoring and control from above is another problem and a challenge to be addressed.

Human resources and the neglected human element in public administration: Bureaucratic culture and cultural conflict is another challenge for Turkish bureaucracy. Clearly, Turkey has a strong statist bureaucratic culture, one inherited from Ottoman Empire and reinforced by the legacy of the political movement and personalities that were influential in the proclamation of Republic and the state-initiated reforms that followed, which affected almost every aspect of social life. The successful introduction of neoliberal market-based policies and practices to the public administration system is contingent on less state control and intervention and the fostering of a new managerialist bureaucratic culture. This gives rise to a clear conflict of traditional and modernity. In the past, the public administration system has been successful – up to a degree – in dissipating this conflict, but this is still a challenge to be addressed. In fact, this is not a problem unique to Turkey. The implementation of the universal and globalized character of neoliberal public sector reform agenda is likely to face difficulties especially in countries where traditions are important and where there is resistive social environment. Local adaptations and synthesis are necessary; otherwise, conflicts are inevitable, making the successful implementation of the neoliberal reform agenda highly problematic.

Administrative reform resistance: For Turkish public administration to be reformed requires both political and bureaucratic acceptance of the need for any reform and a clear understanding and consensus of what constitutes a desirable reform agenda, particularly if a proposed reform agenda has its origins in foreign experiences and alien values. Unlike the experience to date, systemic reform must be planned, coordinated, and implemented considering the system as a whole, not designed and implemented sporadically in "patches" or "fixes" applied to particular areas and issues. This is possible only if there is a political will, good institutionalization, and a politico-administrative consensus. There must be a very clear central reform vision and strategy and the necessary implementation plan. The reform process must be continuous, coordinated, and monitored by a central coordinating agency. Administrative reform should mean just making structural and organizational changes and should not be only be managerialist in scope. It should embrace all elements of the public administration system. Above all, it must change the behavior of public servants, best achieved by raising their consciousness – thereby embedding in their

professional self-identity – the importance of their obligation to be altruistically willingness to serve society and so refrain from seeking only personal gains from any forms of corruption. This is, perhaps, the supreme challenge to be addressed to achieve effective and lasting reform of public administration in Turkey.

## Conclusion

Turkey's public administration system, especially in the last three decades, has been dynamically adapting itself to requirements of a global neoliberal policies and associated practices of public service. However, this is not without problems and burdens. Whereas some of these issues stem directly from this ideology and its praxis, or mismatch between them and socioeconomic and cultural characteristics of the society, others are characteristic to a long-time cultural accumulation of a state centric administrative system with its very strong adherence to centralization and hierarchy and political control.

## Synonyms

Chinese Public Administration

## Definition

Public administration research in mainland China refers to studies on Chinese public sector, such as using Chinese government data to conduct research on organizational theories, human resource management, public budgeting, intersector administration, intergovernmental administration, intellectual history of public administration, as well as many subfields of studies within the domain of public administration and even nonprofit organizations.

## Introduction

Public administration research in mainland China refers to the studies on Chinese public sector and even nonprofit organizations. As China is one of the world's fastest growing economies, many other countries are increasingly interested in the Chinese public administration system which, since the reforms of 1978, has facilitated economic and social development. Academics and practitioners are drawn to the study of Chinese public administration because of the global influence of the Chinese market. The ancient and the contemporary wisdom of Chinese public administration can be valuable to public administration

worldwide, both theoretically and practically (Holzer and Zhang 2002, 2009).

Largely missing from this important area of scholarly inquiry is empirical work that considers the patterns evident in the literature. Although several systematic reviews have examined Chinese public administration literature, none have conducted a word cloud and cluster analysis based on content analysis of the words in the abstracts. Accordingly, we performed a systematic content analysis of words used in the studies' abstracts to obtain a more objective sense of their substantive content, so that other researchers might learn useful lessons from a semantic analysis of the abstracts in studies of Chinese public administration.

This entry begins with a brief discussion of the development of Chinese public administration as an academic discipline, which is the historical root of such public administration research. Next, the topic of comparative studies of public administration is introduced, followed by a review of Chinese public administration research. This entry then provides the results of a systematic and objective content analysis of words in the studies' abstracts and lastly examines the potential for conducting research on Chinese public administration as a comparative approach to understand public administration in the global context.

## The Development of Chinese Public Administration as an Academic Discipline

The intellectual roots of public administration in China can be traced back at least perhaps thousand years, although public administration as an academic discipline is a comparatively recent phenomenon (Holzer and Zhang 2002). After Qin Shi Huang united China in 221 BC, successive dynasties established the first centralized Chinese bureaucratic system, one which enabled the emperor of China to control such a large territory. The essence of this civil service system was to recruit the "best and brightest" into the government according to their merits, demonstrated by their test scores rather than their blood linkage. The imperial examination system (ancient Chinese civil service system) in China continued for 1300 years (Roberts 1993). In the late nineteenth century, Kang Youwei imported the concepts and theories of contemporary public administration from Japan, where public administration was taught by German scholars (Harris 2002).

The origins of public administration as an academic discipline in China can be traced back to 1905, when it was first taught as a subfield of political science in the School of Law and Politics in Guangdong province (Wang 2006). However, in the early 1950s, Mao Zedong's administration believed public administration, as well as other social science disciplines, was irrelevant to the socialist model because the administration considered resolution of class struggles to be the Communist Party's main task. Thus, together with other disciplines, public administration as a field of study essentially disappeared in China for the three decades between 1952 and 1982.

It was not until the 1980s that public administration as an academic discipline was reintroduced in China (Yu et al. 2012). In 1985, the government held a meeting to discuss the development of public administration in China. Soon after the meeting, the State Council approved the launch of the Chinese Public Administration Society. From the latter half of the 1980s, China's public administration development was rapid (Zhang 1993). In the early 1990s, there were more than a thousand public administration books covering a variety of subjects. Academic journals and research organizations began to flourish. Between 1984 and 1992, more than two million state cadres received public administration training via several channels (Zhang 1993).

In 1994, the Chinese National School of Administration (CNSA) was established. In 2010, CNSA was changed to its present name, "Chinese Academy of Governance." Many state-owned provincial- and city-level public administration schools were established thereafter.

In 2002, public and nonprofit employees entered the first group of 24 MPA programs in the People's Republic of China (PRC), and by 2015 the Chinese government had authorized 228 universities to offer MPA programs (National

MPA Education Steering Committee 2015). In comparison, according to NASPAA (2018), there were 190 MPA-related programs accredited in the United States and perhaps as many more offered the MPA without NASPAA accreditation (but in colleges and universities accredited by regional higher education associations, as are virtually all higher education entities in the United States). The United States started its first MPA program in 1924 at Syracuse University's Maxwell School, almost a century ago. In contrast, within little more than 15 years, the PRC has now developed 228 MPA programs, reflecting an urgent demand for talented public employees to deal with increasingly complicated governance issues in a rapidly transitioning society.

## Comparative Studies of Public Administration

Comparative public administration is defined as the quest for patterns and regularities in administrative action and behavior (Riggs 1961). The field focuses largely on reform and capacity building and often seeks to identify universal patterns in organizational structures and processes that promote the most desirable policy outcomes. Governments differ greatly in their historical, social, and economic characteristics and exhibit a range of administrative arrangements. The variation in these administrative systems is due to a variety of factors, including social, cultural, political, and technological factors. Comparative public administration focuses primarily on national (and less so on subnational) administrative systems in the global contexts. It also explores the way in which the organizational structures and processes facilitate or inhibit policy implementation.

The field of public administration emphasizes the need for comparative studies to test the effectiveness of public administration theories (Fritzen 2010). However, to date, few efforts have been undertaken with respect to China. Most of the previous literature consists of comparisons of the public administration experience in different democracies (e.g., see Grimmelikhuijsen et al. 2013; Kim et al. 2013). Compared to the United States and Europe, less scholarly attention is given to authoritarian systems such as the PRC. Riggs (1961) criticized the failure of Americanized and Europeanized administrative theories to apply to different contexts and argued that it should be rectified through comparative administration research.

Comparative public administration is an inevitable dimension of research, given that globalization has transformed the roles of government (Holzer and Kasymova 2012). Globalization has changed the role of government from a welfare state to "hollow state" (Frederickson 2006), "contracting state" (Farazmand 1999; Smith and Lipsky 2009), or "corporate administrative state" (Farazmand 1997a, b, 1999). In that sense, Jreisat (2005) argues that both the national and international environments need to be considered when studying a particular administrative reform.

Kettl (2000) argues that comparative public administration is compelling, as the US government has become increasingly involved in world governance. In a similar vein, Riggs (1961) suggests that the processes of generating reliable knowledge and developing the principles of public administration are inherently comparative. Riggs (1961) also documents that scholars can no longer afford to base their theories on the "exceptional American experience" because it limits comparative public administration to the study of foreign governments. Heady (2001) demonstrates that the comparative method is essential to developing administrative theory and improving its application. Collier (1993) notes that comparison is central to a satisfactory analysis to the extent that the scientific method is unavoidably comparative. Studies in other fields show that most social scientists consider the comparative approach to be the methodological core of the humanistic and scientific method (Almond and Verba 2015). Aberbach and Rockman (1987) echo such sentiments, indicating that comparative study advances scholarship to the level of conceptual and methodological self-consciousness. Offering more nuance to this argument, Aberbach and Rockman (1987) note that it is very difficult to achieve a clear understanding with non-comparative

studies of public administration. Further, comparative public administration is a concern because of its broader social and political consequences; specifically, it helps practitioners to better understand their own institutions, the changing demographics of their communities, and "the different political contexts" they face (Khademian 1998, p. 273).

## Reviews of Chinese Public Administration Studies

Guided by the literature cited above, in recent years, discussions of Chinese public administration that use a comparative perspective have emerged (Gao 2013; Mingus and Jing 2016; Walker et al. 2014; Wu et al. 2013). For example, in the first issue of *Chinese Public Administration Review*, Holzer and Zhang (2002) emphasized "...the necessity of Chinese scholars to learn from international scholars in the field of public administration." In a similar vein, scholars and practitioners in the United States can learn about the challenges of effective public management and the reform of public organizations through comparative studies between the United States and China. Although previous studies examine recent trends in Chinese public administration research, no study has, as yet, conducted a systematic content analysis of words in the studies' abstracts to provide a different and more objective sense of the substantive content. This study began with the belief that conceptualizing the studies of Chinese public administration through a content analysis of the abstracts could help practitioners develop strategic policies to prepare effectively for the challenges of globalization and an information-oriented society. In that vein, we have conducted a word-based analysis of the relevant literature to illustrate the ways in which academics and practitioners can avoid cultural biases in building theories and implementing policies by understanding the limitations and new possibilities presented in the literature on Chinese public administration.

Mingus and Jing (2016) review Chinese language literature to discuss the relevance of Behn (1995)'s questions on micromanagement, motivation, and measurement in the Chinese context. They propose alternate wording for Behn's questions to make them meaningful in the Chinese cultural and institutional context, but they avoid suggestions as to replacing the basic Chinese political structure. Walker et al. (2014) review the English language literature on public administration between 1999 and 2009 regarding East and Southeast Asia as identified in the Web of Science. The authors identify four major characteristics: first, its comparative nature; second, its focus on system and regime change, as well as policies, as the major topics and units of analysis; third, its literature review is based primarily on normative argumentation, and when it is an empirical study, it relies typically on secondary data; and, lastly it is largely interdisciplinary, and while it draws from many disciplines and scholars from all around the globe, it is dominated by scholars who work in English-speaking countries.

Gao (2013) reviews the public administration research literature published in Hong Kong and Macau between 1999 and 2009. Gao examines the ways in which public administration developed in the two city-states in the post-handover period and the ways in which those developments affected the study of public administration in the two jurisdictions. The findings reveal differences between the two cities. In general, studies of Hong Kong engage in testing and building theories using rigorous methodologies and adopting a comparative outlook and receive far better funding than studies conducted in Macau. The focus of studies in Macau differs from those in Hong Kong because the public administration community in Macau sought to foster closer interactions between academics and practitioners.

Wu et al. (2013) provide an overview of public administration research in China based on a sample of 2,877 articles published in the top 6 Chinese language journals in mainland China and Taiwan between 1998 and 2008. Their analysis of these publications suggests that scholars in Taiwan have made great strides in a short period to improve

research quality and provide their colleagues across the Taiwan Strait with valuable insights into the future directions of the field.

Kim et al. (2018) systematically examined the existing studies on public management research in mainland China from 1996 to 2016. They carefully selected the previous research based on the PRISMA guidelines and systematically review the journal names, publication frequencies, authorships, research focus, topics, and methodologies. Their study can be evaluated as progress in that they carried out more in-depth analyses compared to the prior research.

While these studies provide insightful contributions to the literature and help us understand patterns in Chinese public administration research, two questions remain: "What are the most commonly used words in the abstracts of the previous literature on Chinese public administration?" and "How are these words related and tied together?" Our utilization of objective analysis using word cloud and cluster analysis in this study sharpens the validity of results.

## A Systematic Content Analysis of Words Used in the Abstracts

This study conducted a systematic literature review according to the PRISMA guidelines (Moher et al. 2009). First, data were collected by searching various databases including Web of Science, Scopus, EconLit, and EBSCO Academic Search Premier. Within these, this study searched journal articles published from 1996 through 2016 to identify those that included "China" and "public administration" in their titles, topics, abstracts, or keywords ($n$ = 4,403). Second, 1,462 manuscripts were selected after removing 2,941 duplicates. Third, this study evaluated the titles and abstracts and excluded 769 papers unrelated to Chinese public administration ($n$ = 693). Lastly, we examined the full texts of those and excluded 347 articles because they were not relevant to public administration and thus not suitable for inclusion. These decision rules resulted in 346 articles for this study.

After looking at the journal articles' descriptive analyses, a systematic content analysis of words used in the abstracts was performed to obtain a different and more objective sense of the substantive content of the studies in the review. Figure 1 shows the resulting word cloud, which represents the frequency of words that appeared in the abstracts. Figure 2 provides the results of the cluster analysis, which shows which of these words tended to appear together in the abstracts. Both analyses focused on the words used most frequently.

A systematic and more objective content analysis of words in the studies' abstracts also was performed. The content analysis, which used word clouds and clusters to identify important topics, is based on Li and Van Ryzin (2017). Figures 1 and 2 show the word clouds and clusters of words, respectively, used frequently in these abstracts.

The word cloud in Fig. 1 shows the words used most frequently across abstracts to show that the larger the font sizes, the higher the frequencies. The word cloud excluded the main topic words of "China," "Chinese," and "administration." "Public" and "policy," then, were the words used most frequently because of their relevance to the theme. The word cloud also illustrates that most of the studies focused on "government," "social," "reform," "local," "political," "economic," "performance," and "management." The word cloud alone, however, did not provide precise information about linkages between words. Thus, Fig. 2 shows a related cluster analysis that presents the way in which these words were linked in the abstracts. The cluster analysis shows distinct local governments, institutional governance, performance management, economic development, and administrative reform clusters and a large and rather mixed cluster composed of a variety of other words that appeared in the abstracts. These results complement our previous categorization of policy fields and suggest that local governments, institutional governance, performance management, economic development, and administrative reform are some of the most common themes to date in studies of Chinese public administration.

**Public Administration Research in Mainland China, Fig. 1** Word cloud of abstracts

## Conclusion

This study was designed to fill the gap in the literature on Chinese public administration by reviewing English language publications in the top 25 journals in the field. A comparative perspective indicates that global leadership requires global understanding, which evolves from appropriate education that uses suitable methods and content (Jreisat 2005). Previous systematic reviews rely largely on descriptive analyses of the literature. This study, however, uses word cloud and cluster analyses based on content analyses of abstracts in 301 articles published between 1996 and 2016 to obtain a different and more objective sense of the substantive content of the studies in the review.

In summary, this research concluded that the study of Chinese public administration is still very much an ongoing effort. Despite some limitations, our study demonstrated that word cloud and cluster analyses, used rarely in previous reviews, are powerful tools for examining meanings extracted from texts by visualizing the words used in abstracts and interpreting various perspectives provided in the literature over time. Finally, future studies could examine whether performance management results in more efficient and better public services in China.

## Synonyms

COSO ERM; Dealing with risks; Enterprise risk management; Municipal risk management

## Definition

Public administration risk management serves a municipality to gain greater transparency about opportunities and risks to achieve goals better and more reliably. It aims to ensure that public funds are used appropriately and provides an overview of the risk situation.

## Introduction

In recent years, the topic of risk management has emerged to a new level of importance in the public sector (Domokos et al. 2015). Risk management describes a process to identify and prevent risks with a systematic identification, analysis, evaluation, monitoring, and active management of risks. A systematically implemented risk management helps the fulfilment of management responsibilities (Wengert 2013). Increasing the effectiveness of risk management activities, this development has also become of interest for the public administration.

The aftermath of scandals show that the public administration is not spared from such as mismanagement, fraud, and corruption. Financial mistakes, defaults on tax revenue, adverse developments in the financial markets, and a variety of other risks in municipalities may jeopardize the achievement of strategic objectives (RiskNET 2014). Consequently, public administration and its stakeholders demand greater oversight of key risks and initiatives to improve risk and internal control systems.

## Aim and Scope of Public Sector Risk Management

The aim of public administration risk management is to achieve municipal goals better in the long term. Whereas the private sector aims to minimize the deviation from the target profit, the goal of a municipality is to protect and use public funds appropriately and efficiently so that the will of the citizen can be fulfilled and the common good is secured. It becomes a challenge for the system of municipalities with often rotating executives in many countries, who set the municipal goal for their legislation period, to keep a stable public administration risk management that needs long term goals.

Risk management is described as organizational activities and a continuous process for managing risks, which includes the functions of the enterprise-wide identification, assessment, management, and monitoring of risks (International Organization for Standardization 2009). Traditional, silo-based risk management primarily considers the management of individual, independent risks without its interactions. In today's approach, risk management becomes more holistic, also referred to as Enterprise Risk Management (ERM). Risk management in the public sector forms a part of a broader governance framework and identifies risk management and internal control as defining principles of good governance (Woods 2009).

The scope of public administration risk management includes the identification of risks within the municipality itself. To also include public holdings within the risk management in the long run, it is important to achieve a holistic municipal

risk management including participation risks. However, while many countries have no legal risk management obligations for municipal administrations, their public holdings that belong to another form of organization, such as a stock corporation often are subject to statutory obligations concerning risk management.

## Risk Management Concepts and Process

The concepts COSO ERM and ISO 31000 are recognized worldwide and are also used in public administrations. COSO stands for "Committee of Sponsoring Organizations of the Treadway Commission." It is an organization established in the United States with the aim of improving effective internal controls and corporate governance. ISO 31000 "Risk Management Principles and Guidelines" provides principles and guidelines for the application of risk management in organizations. The series of standards "Risk management for organizations and systems, practical application of ISO 31000" by Austrian Standards ONR 49000 serves as an implementation aid for risk management according to ISO 31000 (Heynen and Wartenweiler 2014). The concepts can be used as an aid, but must be adapted to the size and the form of organizations (e.g., a private company or a municipality).

The risk management process according to ISO 31000 includes the clarification of general conditions, the identification, analysis, and assessment of risks. This is followed by risk management, monitoring, and communication. Risk management is understood as an ongoing, repetitive process (International Organization for Standardization 2009).

Risks can be identified using a structure similar to that used in the private sector. A categorization of risks must primarily meet the individual requirements of an organizational unit. In addition to traditional financial risks, operational and strategic risks, financial reporting risks and compliance risks are also taken into account in company-wide risk management, whereby non-quantifiable risks are also included (Strohmeier 2007).

Risks can also be categorized as follows:

- Financial and economic risks
- Legal and compliance risks
- Property, technical, and elementary risks
- Personal and organizational risks
- Technological and scientific risks
- Social and political risks.

In the context specific to municipalities, further risks such as investment risks and procurement risks that municipalities have to deal with become relevant. In addition, public procurement law risks are particularly relevant for municipalities, as public procurement processes are often attributable to municipalities. The complexity of public procurement law regulations, which are strongly permeated by jurisprudence, holds a high potential for error (Beck et al. 2013). Other risks specific to municipalities, also referred to as external risks, are socio-structural processes, general economic development, natural disasters, and political-administrative changes, which can only be influenced to a limited extent or not at all by the municipality. Nevertheless, it is important for a municipality to control and monitor such risks in order to be prepared in case they occur (Schwarting 2015).

## Risk Management Organization and Actors

The organizational integration of risk management depends on the size and complexity of the public administration, the political, national, and regional circumstances, and the organization of the administration. Small communities tend to have more transparent decision-making structures and opportunities for direct influence. The complexity of processes and structures is lower than in larger communities.

Larger public administrations have a higher degree of formalization and have longer communication channels and complex interests. Risk management has formal directives and controls, responsibility structures are more complex, and risk management is becoming the subject of

management processes. If necessary, additional resources are provided for risk management and risk management offices are created (Sartor and Bourauel 2013).

The political, national, and regional circumstances lead to different legal framework conditions of a municipality. The organization of administrations also differs nationally and regionally. Which other actors are involved in shaping risk management and in particular in the implementation process also depends to a large extent on the professional qualifications of the human resources of the executive and administration.

In essence, the following actors are involved in municipal risk management, whereby the equipment of a municipality must be taken into account:

The *Executive* bears overall responsibility for risk management throughout the municipality and decides on the strategic orientation of risk management (Bergmann 2009). Their task is to adopt the concept manual. The concept manual usually contains the definitions, guidelines, and objectives for risk management and serves as a guideline for implementation (Dietiker and Hunziker 2015). The executive also addresses risk policy, draws up a mission statement, and approves the risk management approach proposed by the risk management delegate. It has the competence to partially delegate these tasks. The aggregated risk catalogue and the measures are approved by the Executive. Their assistance and commitment to risk management play an important role towards the administration. Finally, the Executive critically scrutinizes and discusses the results and the process for continuous improvement. The Executive is accountable to other stakeholders such as the community's citizens (Hunziker et al. 2015).

A *risk management delegate* is appointed within the administration. This monitors risk management and bundles the information. It distributes the tasks for the implementation of risk management, monitors it, and reports periodically to the executive and supervisory authorities. The risk management delegate trains the employees and determines the risk-bearing capacity. He maintains the documentation and the tool. The central task of the risk management delegate is to ensure the flow of information between the executive and the administration (Sartor and Bourauel 2013).

The function of the *risk management committee* is particularly suitable for the implementation of risk management and for larger communities with higher coordination efforts. It is suitable for an interdisciplinary composition, whereby both the executive and the administration should be represented (Hunziker et al. 2015).

*Risk owners* are risk managers in the individual departments who are responsible for identifying, assessing, and passing on risks within their area of activity to the risk delegate. They implement control measures and report on new individual risks on an ongoing basis (Sartor and Bourauel 2013).

The *auditing authority* examines the management instrument and reports possible improvements and conspicuities to the responsible bodies, which differ depending on the organization of the municipality. Ultimately, very critical anomalies are reported to the executive and the population. There is the possibility of an internal as well as an external inspection instance.

## Factors Influencing the State of Risk Management Implementation

The progress of the municipal risk management implementation is mainly due to legal obligations. Anglo-Saxon countries contribute to a higher penetration of risk management in public administration. However, only in Australia, at state level, risk management finds legal precipitation and, in comparison to England and Canada, can be attributed to the biggest progress of risk management. Australia, Canada, and England developed generally accepted, nonobligatory standards for public organizations and, in addition with policy initiatives, have contributed to a spread of risk management (Offerhaus 2009).

Another key driver of advanced risk management is the presence of competencies in the municipality (Pfister 2009). Expertise and experience (COSO 2013), an understanding of the processes and the ability to think critically can avoid control failures (Zhao et al. 2015).

The awareness raising against fraud and the will to prevent fraud risks is a major motivation for risk management implementation. Fraud is one of the major risks and a component of operational risk that threatens municipalities' goals, their financial health, image, and reputation (Doody 2009). There are different definitions of fraud, though in general it includes activities such as theft, corruption, embezzlement, and others. The fraud triangle, first coined by Donald R. Cressey, shows the three factors incentive and opportunity to commit fraud as well as the rationalization of the fraudster for justifying fraudulent behavior (Albrecht et al. 1984). One example of a major fraud risk within municipalities is the risk of corruption and bribery in public procurement. Procurement regulations that include risk-retardant arrangements were implemented to prevent such fraud (Beck et al. 2013). Risk management is a management control system to identify and mitigate such risks. Moreover risk management is regarded as a key management control system to detect fraud (Parton et al. 2009).

An important aspect to consider when successfully implementing risk management is having executive support. Support from the top is essential and should begin with the Board of Directors (Marchetti 2012). The responsibility for risk management rests with the board of directors (Woods 2009). Literature (e.g., Sobel and Reding 2004) shows the dependency of an effective risk management on active participation by the board of directors.

To have an appropriate expertise of employees that are able to implement risk management is one more important aspect. To achieve this, investing into risk management training is important. Literature (e.g., Farrugia 2002) emphasizes the important staff training as a key element in risk management and one that needs continuous reappraisal and regular courses to refresh skills.

## Conclusion

While public administration risk management is based on the common pillars of risk identification, analysis, assessment, management, communication, and monitoring of standards such as COSO or ISO 31000, the special conditions of an administration must be taken into account in detail. In the design of risk management, attention must be paid to national and regional differences, but also the size and organizational form of the administration characterizes the development of risk management. The main actors involved into public administration risk management are the executive with the overall responsibility, the risk management delegate with operational responsibility, the risk management committee, the risk owner as administrative staff with individual risk responsibility, and the audit authority as a control body.

In order to achieve a community-wide, systematic, and documented risk management, support from the executive is necessary. While legal obligations serve as a motivator, political initiatives to build up risk knowledge and competencies as well as supporting IT instruments also contribute to implementation progress. Finally, fraud prevention serves as the main driver for risk management implementation. The ultimate target of risk management is to achieve the goals of administration better and more reliably.

# Public Administration Theory

Tansu Demir

## Synonyms

Intellectual history of public administration; Public administration and theory; Public administration research; Theoretical foundations of public administration

## Introduction

Although public administration has existed since the dawn of civilization, its study as a discipline is fairly recent. It is common in the literature to trace its modern foundations to the late nineteenth century. In his often-cited article, which is titled "The Study of Administration," Woodrow Wilson (1887) proposed public administration as a field of study separate from political science, focusing on the efficient implementation of legislative policies. This is known today as politics-administration dichotomy. According to this notion, politics covers all those processes that lead to legislative policymaking, embodied in public laws with clear goals and explicit value choices. Public administration, however, is more concerned with implementation of public policies by applying specialized knowledge and technical skills and aims at translating legislative goals into concrete accomplishments. As such, there is a clear line drawn between political and administrative spheres of government, "as if each function works best as an independent variable, capable of being improved in isolation, without endangering or interfering with the other side" (Martin 1988, p. 632). With further contributions from other scholars such as Goodnow and White, this dichotomy evolved into a normative theory of public administration drawing the boundaries of the field. Following WWII, however, this theory has

been questioned and ultimately discredited. Since then, the scope of the study of public administration has expanded, and today it is characterized by a stunning diversity, in terms of subject areas, foci of studies, and methodologies in use.

## What Is Public Administration? Some Definitions

Corollary to the diversity in the field, it is easy to find many different definitions of public administration (PA):

- PA can be defined as all processes, organizations, and individuals associated with carrying out laws and other rules adopted or issued by legislatures, executives, and courts.
- PA is concerned with the management of public programs.
- PA is the production of goods and services designed to serve the needs of citizens-consumers.
- PA is the accomplishing side of government.

## Public Administration as an Interdisciplinary Field

In the early developmental years of the field, a strong emphasis was placed on efficiency, and the study of public administration was driven by efforts to discover administrative principles that advance the goal of making public organizations more efficient in the fulfillment of their daily duties. The scope of public administration was limited to policy implementation. Early writings in the field focused on this aspect of public administration, mostly bringing to attention its technical, planning, analytical facets. Writers such as Frederick W. Taylor (1911) and Henry Fayol (1916, 1949) provided important tools to aid in obtaining the goal of efficiency. Gulick (1937), in the "Notes on the Theory of Organization," proposed POSDCORB as major functions of public administration, meaning planning, organizing, staffing, directing, coordinating, reporting, and budgeting. This approach to public administration was consistent with the fever of the times, namely, the progressive (good government) movement, an era of passionate search for government reforms that would make administration more efficient (Adams 1992).

Following World War II, however, this limited focus on efficiency and structure received substantial critiques from both scholars and practitioners for empirical and normative reasons. The sharp demarcation between politics and administration was quickly discredited. It was often noted that "a theory of public administration in our times means a theory of politics too." There was a shift from an emphasis on a science of administration to one of placing administration in its larger social setting (Gaus 1950). Principles-based approach to public administration has been discarded as being useless and inherently contradictory by Simon's (1946) well-received critique. Following the horrors of WWII, the issues of power, ethics, and politics received increasing attention and have been subjected to research in the field. Norton Long's (1949) article entitled "Power and Administration" is particularly important to note. Long (1949) made a strong case about why practitioners/students of public administration must study and understand power, given the political structure and culture in the nation. As he put it boldly: "power is the lifeblood of administration." In the early, developmental years of public administration, theoretical development of the field was more inductive, using single case studies and limited observations and focusing on various administrative problems to generate insights that would help practitioners of public administration. This method of inquiry has been viewed weak by some and insufficient to produce generalizable findings. Methodological rigor, as pointed out very often, was lacking. As a result of this need to propose and test more rigorous theories, researchers in the field began to use more quantitative methods and statistical procedures to test their theories.

Over the years, public administration has become a more interdisciplinary field, benefitting from the findings of many cognate disciplines. Today, public administration draws significantly from economics, political science, business, sociology, anthropology, psychology, social psychology, and philosophy, among others. Principle

agent theory, game theory, and network theories and their extensive use in public administration research are indicative of the expansion of interests both in theoretical scope and methodologies (Kettl 2000).

## Public Administration Theoretical Interests

As far as topical interests, it is hard to find a broad consensus in the field regarding what are or should be the central themes in the field. Several authors attempted in the past to identify such common themes, yet it is easy to find significant diversity in the research. Stillman (1991), for, example, states that contemporary public administration thought is an argument, a dialectic among competing models, ideas, and concepts that ultimately turns on the questions: What is the ideal state? The good society? The purpose of community? A review of scholarly journals in public administration will provide a stunning array of diversity on topics studied and methodologies utilized. Diversity characterizes research in public administration. There are possibly a few topics that can be identified as big questions of the field, yet conclusive answers are hard to come by for those big questions. Based on a systematic survey of published research, Perry and Kraemer (1986) put forward two areas of study as being particularly important in public administration: "The study of characteristics that distinguish public administration from other administration and political-administrative system interface" (cited in Box 1992, p. 66).

Scholars also note peculiar challenges of public administration in generating rigorous, widely applicable theories (not necessarily universally valid). For example, in one of the earliest accounts, Dahl (1947) noted some of these challenges. The difficulty to separate normative values from the study (unlike natural sciences), dealing with humans and their (difficult to predict) behaviors, and impossibility of isolating human (or administrative) behavior from the social setting within which behavior takes place make search for widely applicable theories particularly challenging.

## Usefulness of Public Administration Theory

How useful public administration theory is? Since public administration is an applied field, that is, there is a sector of society, identified as implementers of public policy, the field is particularly focused on generating usable knowledge to practitioners of public administration. This is a question posed very often in the literature and is of critical importance because it concerns relevance of public administration discipline. Critics note the disconnection between academe and practice, due, in large part, to the focus, purpose, and language used to code information by researchers (Box 1992). Cunningham and Weschler (2002), in their article titled "Theory and the Public Administration Student/Practitioner," question the usefulness of public administration theory and offer an alternative way to make the field more relevant to practitioners. The authors state that there are two groups of practitioners, line and staff, with each group having a different set of problems to face and solve. Line managers need theory and learning experiences to deal with unstable environments. Staff people, however, enjoy working with abstract systems, and they prefer learning the necessary technical information to incorporate into their reports from authoritative sources such as textbooks and teachers. Line managers prefer working with people where theories related to negotiation, leadership, and organizational behavior are taught most effectively by connecting principles to practice through role-play, simulations, and other experiential learning activities. They argue that public administration research primarily engages staff managers. Having identified the different needs of line and staff managers, Cunningham and Weschler (2002) propose a postmodernist approach to make public administration theory and teaching more relevant to practitioners. Recent studies and surveys also point out to the disconnection between academe and practice (known as two communities approach), showing that policy makers do not appear to use or value academic research in its fullest potential (Newman et al. 2016). As public administration scholar Gaus (1950) once noted, "it is precisely

the day-to-day, intimate activities of governments that can give us hints of those human needs, capacities, and practices from which we may be able to put together a tentative, working hypothesis of government to set alongside the older ones" (p. 168).

## Future of Public Administration Theory

If past gives us some hints about the future course, it should not be very difficult to make some humble predictions on the future of public administration theory. What happens in the field will continue to shape theoretical development of public administration. Privatization, devolution, and public-private (and nonprofit) collaboration will have a significant impact on theoretical developments. As traditional hierarchies are replaced with partnerships and networks, very often with blurred boundaries, new areas of research are emerging. What is the role of public administration in these networks? How can effectiveness be enhanced? How can conflicts be solved and productive work be maintained? Given the relative youth of public administration, as compared to other more established fields such as economics and political science, public administration will continue to draw from the research and methodological innovations of other social science disciplines. It is a necessity, as various historical, sociological, economic, and other conditioning factors have given public administration its peculiar character in each country (Dahl 1947).

Kettl (2000) posed three questions to focus in the years ahead. First, what should replace the field's reliance on hierarchy? As Kettl argues organization theories of networks and political theories of governance can provide much help in answering this question. Second, what should be the field's approach to the policy/administration dichotomy? It is likely that there will be a significant effort continuing in the years ahead to support alternative models (e.g., complementarity model). Third, how can public administration ensure the systematic testing of its theoretical propositions and advance the state of theory? Given the past critique about the lack of rigor in public administration research, this issue will likely remain important.

As political, social, economic, and cultural forces continue to change, public administration and its theoretical direction, including its scope and boundaries, will adapt. Globalization is such a change that adds another dimension to study of public administration, because the process of globalization affects administrative systems in a significant way. Welch and Wong (1998) list information technology, global institutions, and efficiency as three important pressures caused by globalization which will need more attention and research in the field.

## Public Administration Theory Versus Practice in Ghana

Abdulai Kuyini Mohammed

University of Ghana, Legon, Accra, Ghana

### Synonyms

Causes; Consequences; Gaps; Models; Philosophies; Public affairs; Public management; Reality

### Definition

Public administration plans, organizes, and executes tasks for the delivery of goods and services to citizens. It is concentrated in the executive branch of government. Models or theories of public administration prescribe how the bureaucratic tasks ought to be performed. So this chapter asks whether there is a gap between public administration theories and reality in Ghana.

### Introduction

Public administration provides numerous services to the public and serves their interests in many diverse ways. It ensures the security and protection of life and property of the members of society by maintaining proper law and order. The day to day function of government and the economic, cultural, and political development of society as well as national defense and the conduct of external affairs depend on the public administrative system. It is public administration that translates political intentions expressed in policies into public purposes (Robinson 2015). In other words, policies rely on public administration to be effective. Once choices are made, activity must be directed at achieving the intended objectives. This is the domain of administration, in which services are delivered, taxes collected, and laws enforced (Bridgman and Davis 2004: 15). A government stands or falls on its policy choices. Characteristically this implies depending on bureaucrats who work for government. The work of public servants is driven by the policy priorities of the government of the day (Bridgman and Davis 2004).

In order to achieve efficiency and effectiveness in public service provision, public administration should be underpinned by theories of the world, models of cause and effect. Theories and models are necessary and useful in guiding the work of public administration. Models and theories help clarify and direct our inquiry on the tasks of public administration. They facilitate communication and suggest possible explanations for bureaucratic actions (Bridgman and Davis 2004). To successfully carry out the mandate of public administration, we need some guidelines, some criteria of relevance to focus our efforts and to prevent aimless search through seemingly infinite volume of data. Public administration theories give direction to our inquiry.

The public administration systems in advanced industrialized countries have witnessed paradigm shifts. And because of the benefits of theories as a roadmap for the conduct of public business, each paradigm shift has been associated with one or more theoretical models about how the public sector should be organized and run to achieve efficiency and effectiveness. The most widely acknowledged paradigms are the traditional model of public administration; the new public management; and the new public governance. The most significant theoretical principle of the traditional model of administration is Weber's theory of bureaucracy. This theoretical model

of public administration is characterized by among others hierarchical organization of government agencies; permanency of staff; neutrality and anonymity of officials; and appointed officers serving any government party equally (Hughes 2003: 17). The new public management (NPM) paradigm which was ushered in on the heels of the criticisms of the public sector that was predicated on the Weberian model of administration is underpinned by profoundly different theoretical foundations of economics and private management. The tenets of NPM include: emphasis on results in terms of value for money, to be derived via management by objectives; the use of markets and market-like devices; competition and choice; and devolution to staff through improved alignment of authority; and responsibility and accountability (Haque 2007). The New Public Governance (NPG) is unlike the traditional model of public administration (TMPA) and the NPM. Its focus is neither on bureaucratic hierarchy and administrative interest of the TMPA nor the managerial discretion and contractual mechanisms associated with NPM. The NPG places citizens rather than government at the center of its frame of reference (Robinson 2015). It is much broader in that it is construed as the formulation and execution of collective action.

The public administration paradigms and theories that have been explicated here were a brain child of the developed countries. These industrialized countries developed them in response to the shifting circumstances pertaining to their contexts. Nevertheless, these paradigms and theories were imported into developing countries for application hook and sinker without modifications to suit their contexts. But the contexts of Third World countries are different and are expressed in such features as unstable social and political environments; poverty, inaccessibility to accurate and up to date information, ill health, illiteracy, low standards of living, low bureaucratic capacity, and unemployment are other common phenomena This raises the question of: whether symmetric outcomes can attend the application of the developed world's theories in developing countries' contexts. This question is asked because the unfavorable environmental conditions increase pessimism surrounding the efficacy or appropriateness of using the developed world's theories to guide the conduct of public administration in developing countries. Specifically, the study asks the following questions: (1) Are paradigm shifts in public administration discernible in Ghana? (2) Are the theoretical perspectives undergirding respective public administration paradigms discernible in Ghana? (3) Are the theories adequate or appropriate in guiding the conduct of public administration in Ghana? (4) What are the consequences of the junction or disjunction between the theories and the practice of public administration in Ghana? (5) How can the theories be modified to more appropriately align with the conduct of public administration in Ghana?

This chapter is organized such that after the introduction part two expounds on the paradigms of public administration and their associated theories. In part three, the evidence of the application of the public administration approaches to the conduct of public administration in Ghana is presented. In the fourth part, the implications of the junction or disjunction between the theories and conduct of public administration are distilled. The final part concludes with recommendations for creating a better alignment between the theory and practice of public administration in Ghana.

## Paradigms of Public Administration and Their Associated Theoretical Underpinnings

There are numerous studies of public administration and public sector reforms in the first world. Models of public administration in the Third World have generally drawn on experience in advanced countries and public sector reforms have often mirrored reform initiatives originating in OECD countries. Several frameworks have been developed to classify and analyze different approaches to public administration and public sector reforms in developed nations. Most of these are concentrated on the transition from the Old Public Administration to the New Public Management that occurred in the 1980s and 1990s. From 2000, there was a discernible trend

towards an emerging model variously termed the "new public service," the "new public governance," or the "post-New Public Management" (Osborne 2006). As mentioned earlier, each of these approaches to public administration is associated with a distinct philosophy and conceptual framework (Denhardt and Denhardt 2011). Many developing countries have followed a similar path of approaches and reforms to those in more advanced countries through broader governance agendas supported by development partners.

This article limits itself to the broader shift in approach set out by Osborne (2006) who outlines three modes of public administration and management and, by association, their principal characteristics as follows: Public Administration (PA-statist and bureaucratic), New Public Management (NPM- competitive and minimalist), and New Public Governance (NPG-plural and pluralist).

## The Old Public Administration

Informed by the thoughts of Max Weber, the dominant approach to public administration for much of the twentieth century drew on a model of bureaucracy based on the twin principles of hierarchy and meritocracy. It replaced the patrimonial systems of administration where patronage and favoritism dominated government decisions and public appointments. This approach had a number of distinctive features: it relied on centralized control; it set rules and guidelines, it separated policymaking from implementation, it employed a hierarchical organizational structure; it put accent on political neutrality; it stressed impersonality; and it provided standardized services to the public (Hughes 2003). The maxims were efficiency and effectiveness in the management of budgetary and human resources.

This command and control model of public administration was the basis for bureaucratic systems which spread across the globe under colonial rule and then after independence in most Commonwealth countries including Ghana (Robinson 2015). Other jurisdictions embraced variants of this model, chiefly basing on French and Japanese experience, where political factors influenced public appointments under a centralized bureaucratic model. This model was successful in a number of countries, particularly in Singapore where the post-independence political leadership established a high quality and efficient civil service along these lines. A similar approach was followed in China in the context of a one-party state. But many postcolonial states suffered deterioration in the quality of governance and the effectiveness of public administration in subsequent years as neo-patrimonial tendencies turned into reality and state resources and public appointments were subject to the personal influence of political leaders and their followers (McCourt 2013).

By the late 1970s and 1980s, the bureaucratic model was challenged. Some of the criticisms were that: hierarchical structures are not necessarily the most efficient of organizations if comparing outputs with inputs; bureaucracy may be ideal for control but not necessarily for management; the bureaucratic model engenders certainty but is usually slow in moving; and work may be standardized, but at the cost of innovation (Hughes 2003: 32).

## The New Public Management

The problems with the bureaucratic model led to the introduction of the New Public Management (NPM). The NPM refers to a series of novel approaches to public administration and management that emerged in a number of OECD countries in the 1980s. The NPM model emerged in response to the limitations of the old public administration in adjusting to the demands of a competitive market economy. While cost containment was a key impetus in embracing NPM approaches, infusing principles of competition and private sector management was at the core of the NPM approach (Robinson 2015).

The menu of NPM reform initiatives includes a list of measures which are a very difficult bundle to wrap together neatly. Some countries have experimented with one or two of these kinds of reforms while others have adopted all of

them: decentralization, privatization, incorporation, deregulation, and introduction of executive agencies, internal markets, or the use of the purchaser-provider split, as well as tendering or bidding schemes, just to mention a few. The most salient features of the NPM include: improved service delivery; responsiveness; transparency and accountability; merit recruitment; greater autonomy and flexibility for administrators and managers; contract appointments; performance management; new financial techniques; reduction in red-tapeism and rigidity; public private partnerships; and results-orientation (Hughes 2003; Pollitt and Bouckaert 2004).

Commentators questioned the appropriateness of NPM reforms in the context of weak capacity and political support especially in developing countries, emphasizing the existence of supportive institutional and political conditions as a condition for success, and of building core public sector capacity as the priority for public management reforms. The consequences of NPM were extensive, providing a long-lasting and steady agenda for reform, but with a mixed record of success and failure (Hood 2004; Pollitt and Bouckaert 2004).

## The New Public Governance

As a result of the conceptual and practical problems encountered with the old public administration and new public management approaches, the new public governance model was developed. The New Public Governance (NPG) approach as proposed by Osborne (2010) adopts a very different starting point from the two earlier public management paradigms. Unlike the stress on bureaucratic hierarchy and administrative interest as the defining features of the old public administration and the managerial discretion and contractual mechanisms associated with NPM, the NPG approach places citizens rather than government at the center of its frame of reference (Robinson 2015). It is much broader in that it is construed as the formulation and execution of collective action. Thus, among others, it encompasses the direct and indirect roles of formal institutions of government and government hierarchies, as well as the roles of informal norms, networks, community organizations, and neighborhood associations in pursuing collective action by defining the framework for citizen-citizen and citizen-state interactions, collective decision-making, and delivery of public services (Robinson 2015). The NPG approaches public management from the angle of democratic theory, premised on the notion of an active and involved citizenship.

## The Gaps in the Literature

In assessing the discrepancies between theory and practice of public administration, there is often exclusive focus on determining whether the principles that are being implemented are the tenets of the theories and what outcomes are produced in relation to the congruence, or otherwise, of theory with practice. Attention is hardly, if at all, paid to distinguish between the outcomes resulting from half-hearted implementation of the foreign models, simultaneous operation of different components of foreign models, and operation of a dualistic framework of foreign and local models. These three types of gaps which are usually ignored should also be counted in the assessment of the disjunction between public administration theory and practice. The traditional assessment approach is a misleading or a partial effort because the predicted outcomes should not be expected where the theories have been implemented half-heatedly. For example, the execution of the principle of meritocracy in appointment and promotion of civil servants in Ghana is a sham because few applicants are selected on the basis of merit while others are picked on account of "technical know-who," that is, who you know but not what your expertise and capabilities are – half-hearted implementation of the bureaucratic model. The politicization of the bureaucracy through allowing politicians to choose their agency heads under the NPM violates the Weberian model's principle of political neutrality of the civil service – co-action or conflict of different components of foreign models. In some other cases, the models are implemented to the

letter but the predicted outcomes are not achieved due to environmental factors which impose constraints on the attainment of objectives. In some other cases, the imported public administration models are applied in parallel with home grown ones to create a dual system. For example, in Ghana during the military governments especially under the Armed Forces Revolutionary Council (AFRC) and Provincial National Defense Council (PNDC) regimes, parallel institutions like military tribunals and citizen vetting committees were set up and operated alongside formal institutions like the courts and the auditor general's department (Mohammed 2018). Moreover, the indigenous mode of local administration based on ascriptive norms like heredity and kinship that existed in Ghana is still operating alongside the exogenously adopted modern system of administration particularly in rural communities. This makes it difficult to determine which model produces what outcomes. Instead of separating the different types of theory-practice disjunction and their associated outcomes, we bracket them and use the bracketed brush to evaluate the theories. Thus, our failure to distinguish between the different types of gap in our assessment of public administration theory and practice is misleading.

## Criteria for Evaluating Gap Between Theory and Practice of Public Administration

Evaluation of any policy cannot simply take account of the stated objectives for change (Chapman et al. 1997: 208). In this connection, the criteria that are used to evaluate the congruence of public administration theories with practice in Ghana derived from arguments that have advocated changes in public administration philosophies and paradigms in the literature.

In conducting the evaluation, the traditional assessment based on whether the theories have expression in practice and the outcomes that attend their implementation are counted. Also counted are other gaps that is, the half-hearted implementation of the foreign models; co-existence and co-action of components of different foreign models; and operation of a dualistic framework of foreign and domestic models. Each of these gaps produces its own outcomes in the conduct of public administration. This reality should be recognized in the evaluation of the foreign models but it is not.

## Adoption of Public Administration Models in Ghana

Ghana has adopted all the three models of public administration identified earlier to varying degrees. Ghana inherited the bureaucratic model from the British colonizers who applied it in the country. From the late 1980s to the 1990s, the country introduced the donor-inspired NPM reforms epitomized by the Economic Recovery Program and Structural Adjustment Program. From the 2000s onwards, the country embarked on the good governance program (Ohemeng and Ayee 2016).

## Adoption and Implementation of the Bureaucratic Model

The bureaucratic model of public administration emerged largely in Western capitalist nations. According to Max Weber, the model is characterized by prescribed rules and procedures, official documents, hierarchy of authority, selection based on merit, and separation of private or personal life from office (Hughes 2003). One of the distinct features of this model is the "rationalization" of collective action in order to achieve the "highest degree of efficiency" (UNDP 2004: 9). Since Western countries themselves had already applied this bureaucratic model in their own administrative affairs, it was quite natural that they deploy it as well in their former colonies in different parts of the world. Applying the bureaucratic model in the colonies, which stressed maximum hierarchical loyalty, the imperial powers surmised, offered an effective means for them to govern their colonies.

However, unlike the bureaucratic model that evolved endogenously in Western nations, the imitative version of this model imposed

exogenously on developing countries during colonial rule often diverged from their real-life administrative practices (Haque 2007). Thus, a distinction should be made between the bureaucratic model found in Western nations, and the colonial-bureaucratic model in developing countries – the latter usually held the "formal" principles of bureaucratic model but showed considerable deviations in "actual" practices.

In Ghana, this colonial-bureaucratic model came to provide the guiding principles for modernizing state administration. It largely replaced the indigenous mode of local administration based on ascriptive norms like heredity and kinship that existed in almost all African societies (Olk 2003). The adoption of the bureaucratic model in the colonies was inspired by its perceived strengths (e.g., rationality, efficiency, predictability, merit principle, and political neutrality) rather than its frequently criticized adverse outcomes or dysfunctions. Thus, in Ghana, the British colonial government gradually institutionalized the bureaucratic model of administration based on the assumption of political neutrality and hierarchical loyalty. The British model was predicated on a ministerial view of government structure. Under this structure, appointed career bureaucrats are found in almost all positions in the upper levels of the hierarchy (except as ministers) and therefore control most of the key positions in the decision-making process. This was maintained as the fundamental model of administrative organization. However, practice diverged greatly from the bureaucratic model of administration as practiced in Britain in at least three important respects.

First, the staff, particularly those posted to the Gold Coast (name of Ghana before independence), were not the most suited for effective public administration. This was because the personnel preferences of the Colonial Office in Britain, which was responsible for the colonies, largely reflected colonial objectives. Bureaucratic positions were filled not on the basis of merit but on patronage, and frequently, candidates were selected for reasons other than ability (Isichei 1977). This forced Casely Hayford to bemoan in his 1903 condemnation of the colonial system that "patronage rules the day at Downing Street. . .Consequently, there is a class of men who, as human nature goes, would be most obedient, humble, servants of the Colonial Office" (Isichei 1977). Administrative competence was not prioritized as a yardstick, instead political and personal connections were given prime of place. Isichei's (1977: 214) description of the bureaucratic officeholder is apt and joins Burn's (1949) portrayal of the caliber of the civil servant then. She lamented that, "some [of the personnel] were escaping from financial problems or personal unhappiness, some were demobilized soldiers after the World Wars, some saw it as the only choice during the depression years, some were attracted by the prospects of change, adventure and outdoor life." Kuklick (1979: 13) corroborates this description of the caliber of the colonial civil servant. She asserts that for some of the personnel, service in the colonies "seemed to represent only one in a series of attempts to find exotic adventure." She added that, "many were obviously escaping from an untenable situation at home," some saw it as "the only avenue open to them," and still "others made the choice as an act of desperation, undertaken only after past failures."

Second, in the application of the bureaucratic model in Ghana, the colonialists offended the political neutrality principle. This is because the "long grade" officers, the junior members of the colonial administrative service combined political and administrative roles in themselves. They ruled the indigenous population in the provinces and the districts, at the lowest levels of the colonial bureaucracy (Asante 2005). Originally, this category included only the assistant district commissioners, district commissioners, and provincial commissioners. But an even more junior rank, the cadet, was later added (Asante 2005). Despite the fact that these officers were the most junior in the establishment, they wielded considerable powers and decision-making autonomy because of the prevalent poor communication facilities between their stations and the administrative headquarters where the higher officers were located (Asante 2005).

The district officers carried out a wide range of duties. They were the immediate agents of

the Governor in their districts, and their responsibilities extended to all departments, which did not have special representatives at their stations. Thus, in addition to the main functions as magistrates and political officers (the officers responsible for the maintenance of satisfactory relationships between the natives and the central administration), they typically were in charge of detachments of police, the districts' financial account, prisons, road construction, waterway clearing, or any other public works. In addition, they had to be able to perform the role of veterinarian, healthcare dispenser, botanist, and forester (Asante 2005: 60).

Third, there was absence of comradeship; there was prevalence of sectionalism, and class-culture within which officials who were posted to the colonies were perceived to be inferior to those in the home office in Britain. The Colonial Office in Britain perceived officials in the colonies as "ignorant, untrustworthy, quarrelsome, and indiscreet" (Kuklick 1979: 85–86). On the other hand, officers who were in the colonies regarded their superiors in London as "uninformed meddlers who should refrain from exercising the unwarranted close control over the colonies" (Kuklick 1979: 86).

The above exposition indicates that members of the colonial service were not the most suited for the demanding tasks involved in decision making and administration of territories, some of which were larger than Britain itself. The impact of such a milieu of public administration on the functional efficiency of the Colonial Office and the bureaucracy in the colonies was perhaps predictable. There was no mutual trust and respect; neither was there an attitude of cooperation among individuals and agencies within the establishment. The Colonial Office and the civil service in the colonies were therefore not effective institutions for public administration.

Dr. Nkrumah led the country to independence in 1957 and became its first post-independence leader. Although he inherited the bureaucratic model from the colonizers, he was bent on reforming it. His frustration about the bureaucracy stemmed from the fact that it was considered too slow to act – a perceived attribute which was thought to be undermining the achievement of the political goal of rapid socioeconomic development (Gyimah-Boadi and Rothchild 1990). Accordingly, this fed the impetus for the extreme politicization of the bureaucracy, a move which was an affront to the Weberian model of political neutrality of the civil service. Occupants of the top echelons of the hierarchy were replaced as heads of institutions by party members. Dr. Nkrumah resolved that, "he would see to it that there were no civil masters as under colonial rule but civil servants carrying out the policy decided by the cabinet" (Gyimah-Boadi and Rothchild 1990: 233). Dr. Nkrumah warned that, "it is our intention to tighten up the regulations and to wipe out the disloyal elements of the civil service even if by so doing we suffer some temporary dislocation of the service. For disloyal civil servants are no better than saboteurs" (Nkrumah 1961: 173). And indeed, as Gyimah-Boadi and Rothchild (1990) notes because "senior officers were regarded with suspicion," Dr. Nkrumah ensured that the bureaucracy was firmly brought under the control of the political executive.

An effective strategy Dr. Nkrumah adopted to bring the bureaucracy firmly under political control was the establishment of several parallel bureaucratic apparatuses, to carry out national development. These parallel bureaucratic structures included state-owned enterprises, specialized secretariats like State Planning Commission, the Productivity Center, the Water Resources and Power Secretariat, and the Civil Service Commission. All these institutions were outside the regular public services and brought under the Office of the President, who exercised direct control over appointments (Ohemeng and Anebo 2012). This deteriorated the already frosty relationship between bureaucrats and the Nkrumah's government because it not only overpoliticized the public service but it also created coordination problems for it in national development efforts. The coordination problems arose from the fact that some of the organizations and sectors became silos which grossly undermined sociopolitical and economic growth (Ohemeng and Ayee 2016). Accordingly, an administrative confusion was created for the state, a labyrinth

aptly characterized as the politics of institutional dualism.

From the fall of the Nkrumah's regime in 1966 to 1981 when the Rawlings-led Provisional National Defense Council (PNDC) took over the reins of government, there was considerable turbulence in the application of the Weberian model of public administration. Government successions were frequent principally via military takeovers with the exception of the late 1969 to early 1972 and from September 1979 to December 1981, when civilian governments ruled. Like in the Nkrumah's time, public sector reforms were also undertaken in this period which adversely affected the sector's effective functioning and performance. The reforms affected the tenets of the bureaucratic model of public administration that was inherited from the British.

The National Liberation Council (NLC) was the first military regime in Ghana, which toppled the Nkrumah government in 1966. The measures it took that affected the Weberian model of public administration were several First, it attempted to politicize the civil service by substituting politically appointed regional and district commissioners with administrators who were civil servants (Gyimah-Boadi and Rothchild 1990). Second, it enticed the participation of the bureaucracy in conjunction with the business community in the NLC's National Economic Council (NEC), which exercised control over economic policies.

The membership of NEC included five senior civil servants and two financial professionals. The governing style of the NLC and NEC, according to Kosack (2012), was reminiscent of the approach of the British. That approach ensured that public administrators were at the center and administered at the local level via alliances with tribal chiefs and through centrally appointed bureaucrats. Third, it pressured the bureaucracy to operate on the basis of the command and control style as pertained to the military. The command and control style was justified by the junta on the basis that the rational bureaucratic model of public administration bred tardiness of the civil service and lacked a sense of urgency.

The way the bureaucratic model was applied to public administration during the Busia's regime (1969–1972) was similar to what obtained under the NLC rule. The period witnessed bureaucrats as cornerstones in sectoral policy making particularly economic policy. Similar to the NLC regime, these technocrats were drafted externally including those who had worked with the World Bank and the IMF. It was clear that the policy terrain was dominated by politicians and bureaucrats from international governmental organizations, which led to the loss of policy ownership by local decision makers. In other words, the bureaucracy was over politicized, which was contrary to the Weberian model of neutrality of the civil service. The politicization of the bureaucracy was made even sharper when the Busia government dismissed 568 civil servants for alleged inefficiency and incompetence. However, many observers believed that the dismissals were politically motivated. The political motivation thesis is supported by the fact that a disproportionately large fraction of the dismissed was sympathizers of the Nkrumah's regime (Frempong 2007). The court order to reinstate the dismissed public servants was ignored by the government. Moreover, the government's quest to enhance efficiency and productivity in the economy via austerity measures as well as cost imposed on the civil service further alienated the bureaucracy and exacerbated tension between the political and administrative worlds.

During the civilian elected People National Party (PNP) led by Dr. Limann (1979–1981), Ghana aimed among others at guaranteeing the autonomy of public administration and political non-interference through the creation of the Public Service Commission in 1979. The commission was created by amalgamating three institutions, which were, namely, the Establishment Secretariat, the Management Services Division (known previously as the Office of Government Machinery), and the Establishment Unit of the Office of the President (Ayee 2001). Among others, the commission was assigned the task of guaranteeing the merit principle especially through hiring and promotion, and administrative efficiency (Ayee 2001). Successive governments neither dismantled this architecture for delivering public administration nor expressly abandoned

its tenets. The question that arises is: Has the creation of the Public Service Commission delivered on the goal of achieving the autonomy of public administration and insulation from political interference?

The military government of the PNDC (1981–1992) which toppled the Limann's administration envisioned that for the civil service to be effective, it needed a transformation which would remove the bad nuts, reorient its culture, sharpen its skills, and enhance its responsiveness to public service customers. Accordingly, many civil servants were summarily dismissed, while others were accused of corruption and incompetence. Those who were accused of corruption were arraigned before the freshly constituted public tribunals and slapped with long prison sentences. This measure made civil servants who remained in the service to feel a sense of insecurity, intimidation, and political victimization, as well as political control and cooptation.

One of the structural changes that the PNDC introduced was the redesignation of the position of principal secretary (highest rank in the bureaucracy) to that of chief director. The chief director was appointed on the basis of both merit and partisanship. Ascension to the position was no longer to be based on only merit and career progression in the service, but outsider political sympathizers and supporters were also eligible for consideration for appointment (Barnes 2014). This precedent measure of the PNDC was copied by successive civilian elected governments in the fourth republic (1993 to date).

An important component of partisanship in Ghana is a culture of patronage, which has implications for public administrators. The recruitment process for public office is sometimes not based on the merit principle but rather on other factors such as political affiliation, family connection, and ethnic origin (Ayee 2011). This is an affront to the bureaucratic model's tenets of meritocracy in selection and political neutrality of bureaucratic officeholders. The implication of this is that there is an atmosphere of insecurity in the public service which is not conducive to long-term policy formulation and implementation. The turnover of personnel in the public service has also created an experience and expertise gap, which has tended to affect the capacity and capability of the public service to deliver its core mandate.

The politicization of the bureaucracy has been pronounced in the new democratic dispensation (1993 to date). A case in point was the nomination of Opoku-Manu and Oteng Adjei, Chief Directors (equivalence of principal secretary) of the Ministry of Finance and Economic Planning and Ministry of Energy, respectively, by the then ruling National Democratic Congress (NDC) to stand as parliamentary candidates for the Asante Akim North constituency and the Bosomtwe constituency, respectively. The nominations of these candidates were challenged by the then opposition New Patriotic Party (NPP) as not only in contravention of the constitution but also the Civil Service law. Both pieces of law debar civil servants from engaging in politics while still holding their bureaucratic positions. To the disappointment of the plaintiff, the court ruled on November 21, 2000 that the NDC's measure did not constitute an act but only a mere intention.

Per the ruling, the Supreme Court failed to clarify whether public administrators should participate in partisan politics or not. This ruling endorsed the policy preference of the then NDC government and not the plaintiff NPP, because the said individuals could continue to function in their bureaucratic capacities as Chief Director of the Ministry of Finance and Energy Ministry, respectively. Simultaneously, they could continue to campaign as parliamentary candidates for the said constituencies. This is despite the fact that the 1992 Constitution and other legal documents like the Civil Service Law, 1993 (PNDC Law 327) debar public administrators from engaging in partisan politics.

The impartiality of some public administrators has sometimes been questioned not because they acted against the wishes of politicians but because they colluded with them. In particular, there is concern that some public administrators not only advised politicians on ways to get around government guidelines but they also helped politicians to misinform the public. Some public

administrators lobby politicians and some award contracts without the knowledge of sector ministers (Wereko 2008). In addition, the blurring of the lines between government and party matters has not helped in resolving the dilemma of public administrators. Some public administrators have themselves begun to make public their disquiet at the increasing political pressure which they feel they are under. This pressure, they argue, makes it harder for them to be impartial. In part, this can be explained by the wide powers given to the President by the Constitution. Government matters and party matters have sometimes become blurred and there appears to be an increasing tendency for politicians to use public administrators for what used to be considered as party political matters, such as representing ministers or politicians at some ceremonies, acting as the political heads of the ministries in the absence of substantive ministers and deputy ministers or sending press notices which are fundamentally political. Public administrators have felt reluctant to refuse to help because they are worried that they might lose their jobs or their prospects of promotion (Ayee 2009).

A change of government entails an overhaul of the top echelons of the public administrative hierarchy to bring in new faces. The Head of the Civil Service and Chief Directors (the administrative heads of government ministries) had either lost their jobs or redeployed with a change in government since the return to democratic rule in 1993. For example, in 2009 under the then newly elected NDC government of President Atta Mills, there was a case of the transfer of the Northern Regional Police Commander to Accra for allegedly leaking sensitive information to the media. The police boss was subsequently ordered by the Regional Minister to leave a meeting of the Regional Security Committee. Similarly, when in the December 2016 elections the National Democratic Congress (NDC) government under ex-president Mahama lost power to the Nana Akuffo-led New Patriotic Party (NPP) administration, many top ranking bureaucrats either lost their jobs or were transferred to less glamorous positions or environments. The dismissals that have generated much heat and discourse in the media and other public forums are the firing of the Communication Director of Ghana Gas, Mr. Alfred Ogbamey, Controller and Accountant General, Mr. Seidu Kotomah, and the Medical Director of the Ridge Regional Hospital, Dr. Thomas Anaba (The Al-hajj 2017). The Medical Director of the Ridge Hospital filed a writ in court challenging his dismissal but nothing has been heard about it.

In total, 13,000 public sector workers most of whom were hired during the 8 year rule of the NDC have been dismissed in the first 5 months (January to June, 2017) after Nana Akuffo Addo assumed government (Al-hajj 2017). Some of the organizations that have been affected by the dismissals included the National Service Scheme (205 employees); COCOBOD (110 middle level employees); Ghana Police Service (265 recruits); National Security (525 personnel); National Health Insurance Authority (200 staff); Youth Employment Agency (216 employees); and Driver and Vehicle Licensing Authority (100 employees) (The Al-hajj 2017). This is akin to the dismissal of some 568 selected public servants by the NPP administration's forebear government of Prime Minister Busia (Asante 2005). At that time, Mr. Sallah, then a manager of the Ghana National Trading Corporation and one of the 568 dismissed public servants, challenged the legality of his sacking in the Supreme Court. The court ruled against the dismissal and ordered the government to re-instate the dismissed workers but the government refused to re-instate those (Asante 2005).

These dismissals are in contravention of the bureaucratic model's tenet which states that regardless of changes in government civil servants are expected to remain in office without any fear of being sacked or fired unless found guilty of any offence contrary to the ethics of the office (Hughes 2003). Among others, the essence of the permanency principle is that it ensures the continuity of government and its services to the people. It also provides the government with officers with adequate experiences and administrative sophistication.

## Adoption and Implementation of NPM

The NPM seeks to change the culture of the public service with the introduction of private sector ideas such as improved service delivery, responsiveness, transparency, accountability, merit recruitment, greater autonomy and flexibility for administrators and managers, contract appointments, performance management, new financial techniques, reduction in red tapeism and rigidity, privatization, public private partnerships, and results-orientation (Haque 2001). These features are aimed at depoliticizing the public service to ensure that managers or administrators take responsibility for the achievement of results, and a change in political-administrative relationship from master-servant relationship (Cameron 2010). The questions which need to be raised and addressed are: Has Ghana adopted the NPM? Does the NPM model match its practice in Ghana?

The PNDC which seized power in December 1981 took over an economy which was in shambles. The economy was in an advanced state of collapse as soaring prices and acute scarcities had made life desperate for many Ghanaians (Kraus 1991). The socioeconomic conditions were dire because: inflation rose to 116.5% in 1981; tax revenue fell from 17% of GDP in 1973 to only 5% of GDP in 1983; per capita GDP fell rapidly by 3.2% between 1970 and 1981; mineral production index fell by 32; cocoa production reduced from 285,000 mt in 1979 to 225,000 mt in 1982; infant mortality rose from 86 per 1000 to 107–120 per 1000 during 1980–1983 (helped by drought and near famine); real minimum wages plummeted from an index of 75 in 1975 to 15.4 in 1981, or 80% (Kraus 1991).

The above difficult and trying socioeconomic conditions in Ghana occurred at the time when the New Public Management (NPM) revolution was going round the world. This managerial revolution contained some measures with a promise to deal with Ghana's economic malaise. One of the measures was the structural Adjustment Program (SAP) of the Bretton Wood institutions. Because the SAP spoke the NPM language and held the hope of salvaging the Ghanaian economy, the PNDC government embraced it. After unsuccessfully experimenting with socialist programs for a year, the PNDC introduced the Structural Adjustment program (SAP) and the Economic Recovery Program (ERP) in response to high inflation, government deficits, declining productivity, and deteriorating social conditions. The program which has been implemented consistently since 1983 entailed free market policies. For the purpose of tackling fiscal deficits, the PNDC was compelled to remove subsidies on the prices of food and other necessities and reduce spending on education and social welfare programs. Other measures the government undertook under SAP included: devaluation of the national currency; removal of price controls on manufacturing products; privatization of government industries; retrenchment of public sector workforce with the attendant reduction in income particularly for low income classes (Ohemeng and Ayee 2016; Jeong 1998). For example, in the case of downsizing the civil service, the number of civil servants paid each month (including those in extra-ministerial departments) fell from 131,000 in August 1987 to 108,000 in March 1992, a decline of 17%. The NPM inspired Civil Service Reform Program (CSRP), therefore, succeeded in strengthening the mechanism for the control of the size of the civil service. In regard to privatization, a total of 78 public enterprises were listed for divesture in 1987 (Gyimah-Boadi 1997). With respect to contract appointment, the usual job security in the public service was replaced, and still being replaced, by short-term appointments based on contracts, and the tradition of guaranteed promotion is being undermined by the hiring of skilled private sector managers for top positions (Glover-Quartey 2007). Some ministers, for instance, have employed consultants for the same work which could be done by public administrators (Ayee 2013). This has reinforced political control over career activities of civil servants.

In 1994, the civilian NDC government (1993–2000) (which metamorphosed from the PNDC) enacted a new Civil Service Law and launched the Civil Service Performance

Improvement Program (CSPIP) aimed at tackling the service's structural and performance culture (Antwi et al. 2008). The CSPIP introduced a performance management system, with the objective of enabling the government to hold the service accountable for policy development and delivery (Ohemeng and Ayee 2016). Despite these strides, the performance of the bureaucracy did not improve significantly and this led the NPP government under President Kuffour (2001–2004 and 2005–2008) to prioritize public sector reforms on its policy agenda. The government prepared a comprehensive plan that embraced all the elements of civil service reform. This culminated in 2003 to the creation of the Ministry of Public Sector Reform (MPSR) as the core institutional hub for administrative reforms (Glover-Quartey 2007). From the MPSR, the government developed a Citizen Charter to further build capacity for actual service delivery, while at the same time ensuring accountability to public service customers. It also endeavored to enact a law to launch a new performance management. Notwithstanding these strides, by 2008 these efforts were either abortive (in respect to the new performance management regime) or, in regard to the Citizen Charter, execution was fraught with challenges (Ohemeng and Anebo 2012). The unsuccessful nature of all these reforms forced the Mills led-NDC government that was ushered into office in 2009 to introduce, in 2010, its "New Approach" to public sector reforms.

The New Approach was predicated on reconfiguring the public sector process in a fashion that would link public administration to broader national development based on the government's manifesto titled "A Better Ghana Agenda." The reforms unlike previous ones were sector-driven in that it gave ministers primary responsibility for, and made them proactive in, tapping resources for public sector reform for their sector programs (Ohemeng and Ayee 2016). The new approach required that sector ministers identify reform needed to support their sector programs and job creation proposals. The needs identified were then to be submitted to Cabinet for approval for implementation at the sector level (Ohemeng and Ayee 2016). The main thrust of the new approach was performance management. This entailed first government entering into performance contracts with ministers of state on the basis of mutually agreed targets and programs to enhance delivery and performance. This arrangement was borne out of the government's belief that its remit was to deliver public services to citizens and the private sector in a way that generated both opportunities for all and improved standards of living (Ohemeng and Ayee 2016). It envisioned that it could deliver on these goals through effective accountability which could be garnered through performance contracts between the president and the ministers, and between the ministers and their subordinates. However, these reforms were ineffective for a number of reasons. These included: the narrow focus on political commitment to reforms; exclusion of frontline bureaucrats from the process of reforms; limited capacity of the bureaucracy and politicians; and lack of synergy between the government, the private-for-profit and the non-governmental sectors (Ohemeng and Ayee 2016).

## Adoption and Implementation of the NPG

The authoritarian government style of the PNDC that shut the door to consultation and participation of civil society in public affairs changed with the changed political environment at the end of 1992. Ghana moved from authoritarian dictatorship to democratic governance in 1993 and has since stayed on the democratic track. This shift was made possible partly as result of the economic gains which were chalked from SAP from 1983 to 1990. Notwithstanding the gains of SAP, there were still lingering development challenges in Ghana. This raised concerns about the appropriateness of the donor-inspired policy framework of SAP (Stiglitz 2000). The World Bank in particular expressed disquiet about the private sector continued exclusion from the policy-making process (Hutchful 2000). However, such consultation and solicitation could only occur in a liberal political environment and not an atmosphere characterized by a culture of as under the PNDC regime.

This recognition of the importance of participation in development enticed the Breton Woods institutions and the donor community to declare the need for Ghana to liberalize its political environment and embark upon what it referred to as "good governance." The World Bank defined good governance as the "exercise of power in the management of a country's resources for development" (World Bank 1994: 3). There was overwhelming agreement that proper management of Ghana's resources could be achieved through new patterns of interaction between government and society, as well as various stakeholders and concerned groups (Mohammed 2013). Accordingly, good governance developed as a system that would permit societal groups to participate in the decision-making process of the state. These societal groups, in addition to state-sponsored institutions, were to oversee government activities to ensure public accountability. The question that needs to be investigated is: Has Ghana matched the rhetoric of good governance with practice?

Attempts at fostering state-society interaction and the institutionalization of inclusive politics have been made in the new democratic dispensation (1993 to date) with desirable outcomes in some instances. This represents a deviation from the elitist and exclusionary approach to public affairs in the one-party era of the Nkrumah's government (1957–1966) and military dictatorships of the NLC (1966–1969), NRC (1972–1979) and PNDC (1981–1992) regimes.

In Ghana over the past decade, a number of major national exercises were conducted, to promote public participation in policy-making. Between 1993 and 1994, the government held a series of regional and subregional forums to formulate a long-term plan for the social and economic development of the country. The result was a national document, *Ghana: Vision 2020,* which envisioned transforming the country to a middle-income economy by the year. In 1997, a National Economic Forum, based on nationwide public hearings, was held in Accra, the national capital, to review the general direction of the national economy and initiate policies to strengthen *Vision 2020*. In the same year, the Structural Adjustment Participatory Review Initiative was launched. And in 2001, a national economic dialogue was held within a similar participatory framework, culminating in the Ghana Poverty Reduction Strategy (GPRS) Paper. Participatory processes were also employed in the design and implementation of the Renewable Natural Resources Strategy as well as the Pension Reforms More recently, in 2010 an elaborate consultative process to review the 1992 Constitution was launched at the behest of late President Atta Mills (Mohammed 2013). Moreover, only 2 weeks ago, that is, February 8, 2019, a participatory forum was held by the Minister of Fisheries to agree on the timing and duration of a "Close Fishing Season," period when fishing in the sea and rivers will be banned to allow the fish breeding season to travel its full length (Citi News 2019). The fishers themselves suggested dates and were agreed to by the Fisheries Ministry. This made the fishers to own the process and commit to the dates and bans. Attempts to unilaterally imposed "The Closed Season" in 2018 by the Ministry of Fisheries failed because of lack of consultation with relevant stakeholders (Citi News 2019).

Despite these efforts at inclusive governance, there have been several instances of elitism and exclusion in the conduct of public affairs. In these instances the government neither consulted relevant stakeholders nor allowed public input into the development of public policies. These policies and the years they were made include: the Value Added Tax (1995); STX-Korea Housing Deal (2010); Cancelation of Teacher and Nurses Trainee Allowances (2016); Granting of Refuge Status to Two Guantanamo Bay Detainees (2016); National Health Insurance Scheme (2003); Mandatory Toll Levy (2017); and Ghana's New Spying Bill (2016) (Mohammed 2013).

## Dualistic Framework of Foreign and Domestic Models

As indicated earlier, home grown models may be established to operate along foreign models. For instance, the military government

of Flt Lt. Rawlings, the Provincial National Defense Council (PNDC) (1981–1992) established revolutionary organs like the People's Defense Committees (PDCs) and Workers Defense Committees (WDCs) in various cities, towns, villages, and workplaces, including the civil service. These institutions were part of a schema by the regime to incorporate new groups into the planning and implementation of state programs and thereby decentralize the government structures. This dual systems conflated lines of authority, confused organizational missions, and brought about diffused rather than a coordinated approach to the conducted of public business. Ohemeng and Ayee (2016) agree, arguing that the dual system was an administrative labyrinth for the state, which weakened the ability of the authorities to co-ordinate public development. This was because some "sectors became silos, causing loss of coordination, which significantly undermined sociopolitical and economic growth" (Ohemeng and Ayee 2016: 287). In this dualistic framework, attributing causality of success or failure to deliver on the mandate of public administration to one or the other of the models in the dual system became extremely difficult. This peculiarity in the implementation of the Western models in developing countries like Ghana should be taken cognizance of in the literature, but it is not.

In some remote parts of Ghana such as Tidan, Kubalim, Warbogu in the Zabzugu District and Adwafo, Pippie, and Nkaasi in the Bosomtwe District, the traditional governing system centered on the chief and his council of elders still operates alongside modern government (Mohammed 2016). Here, the village chief and his council of elders still vest themselves with combined executive, legislative, and judicial powers. Cases are still being tried at the chief's palace; maintenance of law and order is still the responsibility of the chief as there is no police presence; the chief's palace is still a fortress of refugee for the persecuted and the oppressed; taxes are still being collected on behalf of the modern state on the basis of non-meritocratic chief-nominated revenue collectors; community development programs are still being organized under the auspices of the traditional authorities; in the absence of qualified health personnel, herbalists and traditional birth attendants have filled the void playing a prominent role in the healthcare delivery system; and the provision of water and sanitation services are the responsibilities of villagers. Some of these rural communities are so inaccessible that hardly does the arm of modern government reach out to them. The only time they come in contact with modern government is when they are called upon to vote or when politicians navigate through thick and thin to go and canvass for their votes as in Nkaasi and Abaasi located on the banks of Lake Bosomtwe. Also in circumstances of extreme distress such as natural disaster, disease outbreaks of imaginable proportions, or civil conflict, the state intervenes by dropping relief items or airlifting disaster management or health staff to set up make-shift camps to attend to victims.

The traditional system of government and public administration sometimes conflicts with, and other times complements, the modern system. It complements the modern system when, for example, a traditional birth attendant makes a safe delivery in lieu of which service there would have been birth complications or maternal deaths. It is in conflict with the modern system when, for example, palace ruling fails to dispense justice – e.g., old women accused of witchcraft and banished to witches camps with hardly any necessities of life or young girls of school going age betrothed to fetish shrines and their priests to atone for alleged sins committed, or debts incurred, by their parents in a "Trikosi" system (Mohammed 2013). The traditional system lacks personnel with the requisite skills and professional expertise; it is also unable to raise funds to meet its obligations. Accordingly, it has created for itself an unpleasant image, in most cases, of ineptitude and incompetence. Nevertheless, it has become a necessary evil that complements the modern administrative system.

From this exposition, it can be surmised that the criticisms of inefficiency, irresponsiveness, and ineffectiveness sometimes leveled against the public administration system as arising from the inappropriateness or inefficacy of foreign public administration models in the Ghanaian context are misplaced. These criticisms should rather be

attributed to the malfunctioning of the dual system, with the home grown system being disproportionately responsible for the inefficiencies and ineffectiveness.

## Discussion

The analysis in this chapter indicates that of the different types of theory-practice gap of public administration enunciated earlier, four are discernible in the public administration milieu in Ghana. These include: half-hearted implementation of the foreign theories; application of the foreign theories without reaching the predicted outcomes; co-existence and co-action of tenets of different foreign models; and parallel operation of foreign and domestic models.

In respect to half-hearted implementation of the theories, although Ghana was under British colonial rule (with the colonizer well experienced in bureaucratic administration at home), in the Gold Coast (name of Ghana before independence), the British administrators themselves deviated from the Weberian model. One of the deviations was that the public administrators performed the dual roles of politics and administration. This dualism undercut the tenet of political neutrality and legal-rational attribute of the bureaucratic model. In addition, their selection of officeholders was based on patronage rather than merit. The deviation from the bureaucratic model was also blamed on the residual paternalistic and kinship-based rule that existed in Ghana during the precolonial period. District colonial officers were supposed to organize the natives into functional hierarchies along the traditional system of undemocratic rule which was inconsistent with the bureaucratic model. Yet, by supporting and protecting the chiefs, the officers earned the chief's obligation to follow instruction of the government. This in turn assisted in securing and exalting the officials' positions.

Upon gaining independence, Ghana adopted the Western parliamentary and presidential systems of politics and inherited the bureaucratic model of public administration. However, huge departures from the politico-administrative arrangement occurred for a variety of reasons. These included the one-party rule, military dictatorship, and corruption and clientelism. For example, the promulgation of the 1960 constitution converted Ghana into a one-party state and conferred life presidency on Dr. Nkrumah, as well as gave him veto power, and power to dismiss judges and decree laws. This turned him into a harsh constitutional dictator. Imposition of successive military governments for much of Ghana's life as an independent country led to highly centralized government processes and marked degree of social disintegration and economic stress. In such scenarios of authoritarian ideology, public administration merely administers commandments and decrees (Vyas-Doorgapersad 2011: 238) instead of objectively providing policy advice. Even in the current democratic dispensation, Ghanaian governments, like their counterparts in most African countries, are still characterized by executive dominance of governmental power. In such a climate, the bureaucracy defers to the executive and this makes bureaucrats either political or passive suppliers of policy advice.

Thus, despite the fact that the public administration system of independent Ghana formally professed the bureaucratic principles such as structural hierarchy, rational decision-making, political neutrality, just to mention a few, in practice, the system operated as a "bureaucratic polity," departing a great deal from the Weberian model of bureaucracy. The term "bureaucratic polity" originated from Fred W. Riggs who applied it in his work on Thailand. It means a system of government characterized by military rule, political cooptation of top civil service, and patronage and corruption (Haque 2007). These pervasive characteristics of the Ghanaian bureaucratic polity portrayed considerable departures from the aforementioned tenets of a rational bureaucracy.

With regard to the NPM, it has proved difficult for Ghana to drastically change the past state-centric structures (including the legacy of colonial bureaucracy, postcolonial one party rule and military dictatorship) and adopt a market-oriented administrative model like NPM. In particular, properly written contracts are tainted with

collusion and corrupt processes. For instance, the service contract that the Accra Metropolitan Assembly (AMA) awarded to Town and Village Waste Limited (TVWL) was kept secret, but when it leaked out to the public, serious questions on conflict of interest were raised. The chief executive (the mayor) of the AMA was a member of the board of directors of TVWL when the contract was awarded. Other members of the board of the company were known members of or sympathizers of the ruling political party without any experience or expertise in waste management. Given all this, the TVWL became an untouchable private agent of the AMA in a supposedly principal-agent relationship (Awortwi 2012). Furthermore, the performance contracts between the President and his ministers and between the ministers and their chief directors in the Mills-led NDC government were never signed. And implementation of the performance contract policy was ad hoc and ineffective (Ohemeng and Ayee 2016). Moreover, the politicization of the civil service has not ended and the administrative system remains vulnerable to vested interests.

In reference to the application of foreign theories without reaching the predicted outcomes, a number of factors are blamed for it. These include lack of capacity, lack of resources, political instability, and lack of contestability and competition. For example, in terms of contestability and competition, in Ghana the small size of the economy particularly in the rural areas does not allow for contestability and competition to emerge. Not only are there few qualified contractors but also those deemed qualified are lacking the required capitalization, expertise, human resource, and experience to mount successful bids (Awortwi 2012). The few qualified contractors also move from one local jurisdiction to another to compete for contracts. Thus, the receiving jurisdictions are neither able to grow their own local contractors nor necessarily select the most competent vendors to do the job. The deduction from this is that the foreign theories are presented as if countries around the world have the same or comparable levels of capacity, resources, large markets and stable political systems, and accountability apparatuses and culture to successfully implement the theories. This study draws attention to the inadequacies in the developing context for successfully prosecuting these public sector reforms agendas. So the predicted outcomes are frequently not achieved in the developing context not because the theories are inappropriate but for the fact that conditions needed for their successful implementation are absent.

Pertaining to the coexistence and coaction of tenets of different foreign models, elements of old public administration theories and paradigms may coexist and coact with those of current models. In doing so, they may work at cross purposes {with the elements of the stronger model(s) undoing those of the weaker one(s)} or they may concert in achieving the same objectives. For example, in Ghana some elements of the NPM work against some tenets of the bureaucratic model in one vein, while in another they are complementary. To illustrate, the NPM seeks to change the culture of the public service with the introduction of private sector ideas such as improved service delivery, responsiveness, transparency, accountability, and merit recruitment (Hughes 2003) – all of which are measures the bureaucratic model also espouses. These features are aimed at depoliticizing the public service to ensure that managers or administrators take responsibility for the achievement of results, a change in political-administrative relationship from master-servant relationship (Cameron 2010).

Nevertheless, some of the features of NPM also support politicization of the civil service which the bureaucratic model rejects. For example, the call for political leaders to choose their agency heads may require some sympathy with political goals or pursuits. This has the potential of undermining the neutrality and non-partisanship of the bureaucracy as required under the traditional model of public administration (Hughes 2003). Furthermore, the NPM is seen by political leaders as a reassertion of political control over the career bureaucracy. Thus, the coexistence and coaction of principles of the bureaucratic and NPM models toward the same ends or at cross purposes, as explicated above, make attributing which specific model compelled which specific

outcome or gap between the theory and practice of public administration very difficult.

Concerning the operation of the dualistic framework of foreign and domestic models, the indigenous model of public administration and government was, and still is, predicated on autocratic-paternalistic rule and kinship-based authority. This was disrupted, albeit not dismantled, by colonial rule and postcolonial government and administrative modernization. The traditional system operates on the basis of reciprocity rather than legality and it is still the foundation of the Ghanaian society today. Loyalty is to the visible existing person, not to an abstract principle as in modern government (Mohiddin 2008). Ethics about public property or services are such that misappropriation or executive or bureaucratic abuse are routinely tolerated, as long as the perpetrator is "one of us" and not "them." On the other hand, the modern system functions on the basis of legality, rationality, impartiality, and accountability, which are at loggerheads with many of the principles of the traditional system. Since the two systems work together, one may have preponderance over the other in some locations. This is precisely the case in the rural areas where the indigenous model holds sway and has eclipsed or virtually obliterated the modern models.

The implications of applying these exogenous public administration models in Ghana, as in other developing countries, are several. The implementation of the colonial bureaucratic model culminated in the conflation of politics and administration and led to the degradation of politics, expansion of bureaucratic power, erosion of civil society, and establishment of an over-developed bureaucracy vis-á-vis other realms of society in Ghana.

The introduction of NPM reforms has had negative consequences for Ghana. For example, the adoption of NPM features into public reforms in Ghana has diminished the "publicness" of public servants. The major causes and objectives of these public sector reforms have been, among others, to: overcome public sector inefficiencies; correct the inherent obstacles to the publicness of the public service, including its accumulation of excessive power, lack of accountability and representation, indifference towards public needs and demands, official secrecy and inaccessibility, and role in depoliticizing the public sphere (Haque 2001). However, the NPM business-like reforms in governance have been blamed for diminution of the publicness of the public service in regard to its institutional and normative identity, composition of recipients, pattern of socioeconomic roles, degree of accountability, and level of public trust (Ayee 2013). Put differently, the reforms have "resulted in negative trends—the erosion of public-private distinction, the narrow composition of service recipients, the weakening role of the public sector, the worsening problems of accountability, and the declining level of public trust" (Haque 2001: 67). Notwithstanding the justification of political decision makers that public sector reform or reinvention can reduce people's anti-government sentiment and revive their confidence in government, there is an increasing degree of public distrust or cynicism toward public governance, which implies its diminishing publicness.

Moreover, NPM via its streamlining of the public sector, reduction in government subsidies, and service delivery predicated on user-charges has affected low income families adversely. Government and donor partners responded by introducing the Program of Action to Mitigate the Social Cost of Adjustment (PAMSCAD). However, PAMSCAD did little to alleviate the high cost of living. Others blame NPM pro-market reforms for diminishing the state's financial and regulatory capacity and the increased vulnerability of Ghana's economy to external economic powers.

The disappointing outcomes of NPM-inspired public sector reforms provoked advocacy for a novel public service, which is predicated on democratic citizenship, community and civil society, and organizational humanism and discourse theory (Denhardt and Denhardt 2000). The initiatives in the new governance reforms in Ghana converted authoritarian rule to democratic government, guaranteed civil liberties like freedom of speech and assembly, and enticed citizen participation in public affairs. Nevertheless, citizen participation in representative democracies is intended to supplement, not replace,

representative governance (Woodford and Preston 2011). As such, citizens do not have authority over policy decisions and essentially perform an advisory role (with the exception of binding referenda, which are seldom applied in Ghana). As a democratic instrument, participation is therefore a contradictory process. On one hand, the state encourages citizens to get engaged. On the other, it leaves them dependent on government officials for access, information, and action (Woodford and Preston 2011). Meaningful participation occurs when the potential exists that citizen involvement will shape policy decisions, which requires that public administrators and policymakers be committed to genuinely considering citizen input in policy analysis and decision-making. These conditions are relatively absent in Ghana. Nonetheless, CSOs are now aware that they have unique opportunities to play an important role in the new democratic dispensation in, for example, acting as a countervailing center of power and empowering people.

## Conclusion

This study set out to investigate the congruence of public administration theories with practice in Ghana. The evidence showed that a considerable gap exists between prescription and reality largely because the models were imported from the developed world without tailoring them to suit the Ghanaian context. Thus, contextual factors constrained the attainment of the predicted outcomes of the foreign models. The other reasons for the gap are: the half-hearted implementation of the foreign models (which made attainment of the predicted outcomes of the models difficult); simultaneous operation of components of different foreign models (which in many instances worked at cross purposes and made attribution of success or failure to achieve outcomes to any one of them difficult); and the operation of a dual system of foreign and indigenous models (which established a dualistic decision-making framework which made initiatives or policies unreliable and often contradictory).

In the above Ghanaian milieu in which public administration was, and is still, being conducted, high-level decision makers ought to rethink their extant fashion of enunciating administrative principles and practices predicated on the theories that almost exclusively were imported from different developed countries. They ought to evaluate their own contextual circumstances, take cognizance of their people's aspirations and needs, and thereby fashion out a more pragmatic and indigenous problem-based administrative theories and frameworks that can overcome the theory-practice disjunctions and negative outcomes produced by such imported models of public administration. Nevertheless, the Western administrative models can still provide the heuristic for drawing appropriate best practices while eschewing inappropriate ones.

# Public Administration, Governance, and Illegal Small-Scale Mining in Ghana

Alex Osei-Kojo[1] and Kwame Asamoah[2]
[1]School of Public Affairs,
University of Colorado Denver,
Denver, CO, USA
[2]Department of Public Administration and Health Services Management,
University of Ghana Business School,
Legon – Accra, Ghana

## Synonyms

Ghana; Governance; Natural resources management; Public administration; Public problems

## Definition

Illegal small-scale mining refers to mining where operators have not formally registered their sites with government (Andrews 2015).

## Introduction

The observation that public problems, such as climate change and poverty, are complex, cross-scalar, and multidimensional remains a staple of public administration scholarship. Describing the role of government in confronting such problems, Baumgartner and Jones (2015, p. 6) wrote that "governments not only face complex individual problems but also multiple problems, and these problems are not prioritized. This means that when they make progress, say on poverty, some actors might say that they are paying insufficient attention to, for example, the environment, health care, national defense, or the space race."

For scholars in public administration, the complexity of public problems explains why the field is multidisciplinary. According to Rosenbloom (2015), public administration encapsulates four broad components: politics, constitutional law, management, and administrative law. From an epistemological standpoint, public administration is a postnormal science, meaning that different values and traditions influence scientific inquiry in the field (Riccucci 2010). This implies that the methods of scientific inquiry into public problems are different from those of natural science. As a discipline, public administration is rooted in unique philosophical and theoretical premises shaping the phases of governance: problem definition, policy development, implementation, management, and evaluation.

This essay applies the philosophical and theoretical premises of public administration and the different phases of governance, to analyzing illegal small-scale mining in Ghana, known in local parlance as *galamsey.* Illegal mining in Ghana is an archetypical complex problem as it is cross-scalar, involving public, private, nonprofit sector actors interacting at the micro, mezzo, and macro levels of government. The relevant public agencies regulating the sector are the Ministry of Lands and Natural Resources, the Minerals Commission, and the Environmental Protection Agency (EPA), according to the Minerals and Mining Law of Ghana (Act 703, 2006). Private interests in the sector comprise individuals and collectives who are engaged in mining, and nonprofit organizations within the sector include the Third World Network and WACAM. Current scholarship suggests that there are multiple drivers of illegal mining, including poverty, inadequate access to mineralized land, unemployment, inefficiencies in license administration, and corruption. In short, these attributes make illegal mining a complex problem.

**Applying the Theoretical Bases of Public Administration and the Different Phases of Governance to Illegal Small-Scale Mining in Ghana.**

A core tenet of public administration is that societal values influence our understanding of public problems (Van der Wal 2008). Bozeman (2007, p. 17) writes that "a society's public values are those providing the normative consensus about: (1) the rights, benefits, and prerogatives to which citizens should (and should not) be entitled; (2) the obligations of citizens to society, the state, and one another; and (3) the principles on which governments and policies should be based." Similarly, van der Wal (2008, p. 11) defines values as "qualities and standards that have a certain weight in the choice of action." These definitions imply that while societal values define rights and obligations of citizens, they serve as principles for governmental action. Such principles are regarded as the pillars of public administration: efficiency, economy, effectiveness, and social equity.

Historically, the role of public values in public administration theorizing ignited the famous Waldo-Simon debates. The crux of this debate was whether public problems and solutions could be analyzed devoid of values. While Simon (1947) argued that values have little locus in studying public administration, Waldo (1984, p. 171) contended that ". . . administration is suffused with questions of value." In hindsight, however, both facts and values are important to understanding public problems (Riccucci 2010).

Drawing on the foregoing insights, illegal mining in Ghana has a *societal value* dimension. Based on one of Bozeman's (2007) three dimensions of societal values, which is the benefits that citizens should be entitled to (or not entitled to), the proliferation of illegal mining in Ghana could be that Ghanaians, particularly those living in mining communities, feel they have not benefited from mining wealth. The emphasis on mining communities is consequential because they are "typically located in deprived areas whose conditions have worsened because of chronic poor service deliveries" (Ayee et al. 2011, p. 11).

Locked up in abject poverty, individuals and groups engage in illegal mining as employment. Current available statistics indicate that illegal mining in Ghana is a poverty-driven activity, employing one million people directly and 4.5 million indirectly (McQuilken and Hilson 2016). Similarly, a study by Andrews (2015, p. 4) found that "the absence of socioeconomic safety nets in most mining communities has left many families, including children, into such a business." While it might be naïve to endorse illegal mining on grounds of poverty, given its environmental impacts, it is probably short-sighted for policymakers in Ghana to dismiss the values that drive the practice. The theoretical premise in public administration that public problems are value-laden implies that there is no "objective" means of defining public problems. Hence, it is necessary to incorporate societal values in defining public problems, in order provide a broad understanding to aid policy development.

As a logical step in the phases of governance following problem definition, policy development refers to the formulation of policy alternatives to solve public problems. There are several philosophical foundations of public administration that relate to policy development, but three are discussed in this essay: epistemology, the process of information gathering and application of theory. The understanding that public problems are complex raises the need for policy-relevant research. The premise is that research is useful for unpacking the complexity of public problems so as to improve understanding. But what is the *best way* to conduct policy-relevant research in public administration, given that it is a postnormal science? Insights from Riccucci's (2010) *Public Administration: Traditions of Inquiry and Philosophies of Knowledge a*re instructive. According to her, since there are different routes to knowledge the *best way* to conduct public administration research is contingent on the research question under investigation. This implies that there are different routes to studying public problems. And whichever route one takes, the research question(s) should dictate the method.

Baumgartner and Jones (2015, p. 25) argue that, confronted with complex problems, public organizations should be structured in a manner that allows them to gather information from different sources. Since public problems are complex, entropic search, which incorporates multiple perspectives of consideration into the process, is likely to lead to a solution rather than expert search, which censures differing viewpoints thereby blocking potential solutions. They conclude that ". . .if a problem is complex, or if the debate is about relative priorities among incommensurate problems, then establishing clarity may not be useful."

To maximize the utility of diverse research methods and information for policy development, it must be theory-driven. According to Frederickson et al. (2016, p. 7), such an approach enables ". . .the ordering of factual material so as to present evidence through definitions, concepts, and metaphors that promote understanding." By grounding policy development in theory, policymakers are better positioned to clearly parse the different causal drivers of public problems.

Refracting the problem of illegal mining in the prism of the foregoing arguments suggests the need for data that are collected through different methods. With qualitative inquiry dominating current analyses on illegal mining, there is an urgent need for quantitative analysis that, for instance, tests the relationship among illegal mining, poverty, and unemployment. Such analysis would help substantiate the popular claim in the current literature that poverty and unemployment are among the fundamental drivers of the practice.

At the same time, as Baumgartner and Jones (2015) have cogently argued, understanding

illegal mining in Ghana would benefit from entropic information search, which incorporates diverse information into policy development than expert information, which restricts information search. Currently, illegal miners, who constitute over 85% of small-scale miners, are not engaged in policy development dialogues and have been subject to *brutal* measures from successive Ghanaian governments such as shooting, arrests, and confiscation of assets (Hilson 2017). The policy implication cannot be missed: failure to engage illegal miners shuts opportunities to understand the nuances and dynamics of the problem. Additionally, grounding analysis of illegal mining in theory would improve understanding of the problem through systematic ordering of facts about the behavioral patterns and motivations for action that surrounds the practice.

Following policy development in the phases of governance is policy implementation and management. According to O'Toole (2000, p. 266), implementation is ". . .what develops between the establishment of an apparent intention on the part of government to do something, or to stop something, and the ultimate impact on the world of action." For Bozeman (1993), management carries the notion of applying contextual and experiential knowledge, in addition to strategy to deal with multi-organizational public problems. Policy implementation carries the idea of translating government intentions into reality, while management entails the strategy or action steps that support implementation of organizational goals. For successful policy implementation, government is required to take several steps including hiring new personnel, allocating funds, and creating new administrative structures. Understanding the factors that support or undermine implementation is therefore consequential.

The theoretical premises of public administration about implementation and management cover important themes briefly outlined here. First, while factors such as leadership commitment, availability of resources, operational adaptation, cooperation, and learning support implementation, weak organizational capacity, inadequate financial resources, and discrepancy between policy and implementation contexts undermine implementation (Goggin et al. 1990). Second, public administration scholars, in recent times, emphasize outcome of implementation as a performance measure, rather than outputs alone. The difference is that while outcome focuses on results, outputs emphasizes achievements. The call for outcome-based measurements has implications for the kind of data that can be used for analyzing program outcomes. Third, the nature of public problems demands a multi-organizational effort under a collaborative arrangement. For O'Leary (2015), collaboration across agencies and levels of government marks a radical departure from the era when Taylorism held considerable sway. She suggests three factors that explain the rise of collaboration among public agencies: (1) the scale and depth of public problems; (2) quest to improve performance of programs; (3) information sharing through technology; and (4) citizens' search for avenues of engagement.

Reflecting on the foregoing theoretical premises, the problem of illegal mining in Ghana requires a collaborative effort across agencies and different levels of government. Current collaborative efforts include the five-member interministerial committee established in 2013 by former President John Mahama "to crack down on Ghanaians and foreigners who engaged in small-scale mining." (This task force was established in May 2013 by the previous government led by John Dramani Mahama. See link for details: https://www.modernghana.com/news/719687/minister-gives-up-on-fighting-illegal-mining-wants-new-appr.html. Accessed on: September 21, 2018.) A related effort is the eight-member interministerial committee established in 2016 by the current President, Nana Akufo-Addo, to implement measures "to clamp down on the activities of illegal miners." (Further details can be found in the Daily Graphic, Wednesday, 5th April 2017, 24,41) Indeed, the current Minister of Information, Mr. Mustapha Abdul-Hamid mentioned, ". . .the preoccupation of the committee is to foster collaboration with other stakeholders, especially the media, to wage relentless war against all people who were engaged in the 'galamsey' business" (Boadu and Ngnenbe 2017, p. 24).

While these collaborative efforts are laudable, there are important observations worth highlighting. The establishment of two inter-ministerial committees on illegal mining in less than 5 years under different governments suggests a potential lack of policy continuity to solving the problem. Given that the practice is entrenched in Ghana, a long-term approach is likely to be more feasible than an adhoc, short-term approach. A long-term approach can learn from Lindblom's (1959) *Science of Muddling Through.* According to him, given that public problems are value-laden and often lack clear standards for decision-making, policies should be developed and executed incrementally. This means taking small policy steps towards broader policy goals and avoiding big policy leaps. Based on the wisdom from incrementalism, aspects of the current policy lexicon of the inter-ministerial committees such as, "to crack down," "to clamp down," and "to wage relentless war. . ." are suggestive of big policy leaps, and therefore likely to face implementation challenges.

At the same time, as has been argued previously, both committees took no steps to engage illegal miners, at least in the reports cited in this paper. The challenge with such an approach is that policy-makers miss opportunities to gain first-hand insights into the dynamics and nuances of the problem. If previous policy discussions that ignored illegal miners in policy development dialogues have not worked, then, on pragmatic grounds, it is high time policy makers actively engaged illegal miners in exploring solutions to the problem. Beyond these collaborative efforts, it is important for government to provide the needed resources to support policy implementation. A recent study by Osei-Kojo et al. (2016) found that government agencies lack the requisite resources, in terms of logistics and human capital, for effective implementation of small-scale mining laws in Ghana.

As the last phase of governance, evaluation is the basis for determining policy success or failure. According to Pressman and Wildavsky (1984, pp. 181–182), the theoretical premise of public administration regarding evaluation is that ". . .for evaluation to be effective in its expanding domain, it must be aimed at gathering data that can be used to improve the implementation process. Evaluation must allow future implementation processes to learn from errors." Clearly, the role of research and data collection for evaluation connects with several themes in Riccucci's (2010) work. To reiterate a previous point, the methods of data collection and analysis for evaluation should be guided by the research question that one intends to answer.

Applied to illegal mining in Ghana, there is the need for evaluation of both previous and present government policies in order to learn from past mistakes. Since data is central to any evaluation exercise, policy-makers in Ghana's small-scale mining sector need reliable data on questions such as: how many people are engaged in the practice and what are their motivations? Why does illegal mining continue to flourish despite several efforts to halt it? Answers to these questions – and others – would provide the needed data to support sound policy development in dealing with the problem of illegal mining in Ghana.

## Conclusion

This paper apllies the philosophical and theoretical foundations of public administration and the different phases of governance, to analyzing a public problem. Focusing on Ghana, the essay argues that illegal mining is an archetypical public problem, which is value-laden. Such values suggest that practice proliferates because people feel they do not benefit from the distribution of mining wealth, and therefore have to engage in illegal mining to survive. Further, understanding illegal mining in Ghana requires application of research methods based on questions under investigation, expansion of the process of information gathering to allow information diversity, and situation of analysis in theory. Additionally, government must endeavor to provide the needed resources to support implementation and effectively manage collaborative efforts in tackling the problem. Last, policies on illegal mining can only be judged as a success or failure based on rigorous evaluation.

The theoretical underpinnings of public administration are applicable to the different but related phases of governance, as shown here. Such an endeavor may have its limitations, as problems will continue to grow in complexity and solutions may not always be found. Yet, it remains useful to scholars and practitioners in better understanding and explaining the world of public administration.

# Public Administration: A Bibliometric Research

Pedro Antonio Martín Cervantes, María del Carmen Valls Martínez and Salvador Cruz Rambaud

Economics and Business Department, University of Almería, Almería, Spain

## Synonyms

Bibliometrics; Comparative analysis; Lines of research; Public administration

## Definition

Employment of bibliometrics to detect the "stylized facts" of the Public Administration throughout the twentieth century, reviewing chronologically its evolution as well as, among other

aspects, the main topics, and lines of research considered by this discipline.

## Introduction

The frequent use of conceptual fallacies such as the *fallacy of virtue* or the *argumentum ad novitatem* usually obscures the focus of any scientific research both insofar as it is considered that a specific field of knowledge is preferable to another if it comes from a relatively modern idea or line of research and, equally, if it comes from a certain historical-sociological period. The study of the Public Administration faces the same problem: the pretentious starting point of presupposing that this Science starts from the "Western World" began throughout the nineteenth century at the dictate of the liberal-bourgeois revolutions derived from the thought of the Enlightenment, is completely wrong: the first rudiments of the Public Administration can and should be located in the "Fertile Crescent" of the Middle East several millennia ago (Farazmand 1998, 2011b). Sometime before Western scholars came to wonder whether the Public Administration is really more an art than a Science, the archaic civilizations of this area of the globe (Farazmand 1999a) were self-regulating according to a series of moral-ethical codes that should be taken into consideration and that should guide the researcher of this phenomenon to two clear conclusions: On the one hand, Public Administration begins at the exact moment in which the human being begins to socialize and, on the other hand, the problems of today that try to be solved by means of Public Administration are essentially the same ones that the first human civilizations already knew (Farazmand 2015). The only aspect that has changed over time, and in an increasingly dizzying way, is the context in which modern societies coexist, which is why the Public Administration has been specializing in various areas, as reflected in the specialized literature of the last century.

In fact, as L. von Stein, one of the fathers of this scientific discipline, anticipated, "Administration is all what I cannot name," that is, a wide range of sciences that encompasses and conditions an enormity of topics that are entirely dependent on each historical context. This entry of the encyclopedia aims to provide a global image of the main defining features of this research, in other words, its "stylized facts" characterizing it and systematizing them on the basis of bibliometrics. To this end, it is used the set of bibliometric procedures elaborated by Cuccurullo and Aria (2017) in order to highlight the most important topics in the field of Public Administration research between 1906 and 2020. The structure of the entry is as follows: firstly, the multifaceted character of this discipline is highlighted, taking as a reference point several key works by A. Farazmand, essential to contextualize the current literature. A brief bibliometric review is then presented, to finalize the conclusions to be derived from this contribution.

## The Changing Context in Which the Contemporary Public Administration Operates

How it has already stated, neither the human being nor the Science of Public Administration has changed, but the superstructure in which it is put into practice. At present, several elements affect this field of knowledge, such as the unquestionable repercussion of globalization (Farazmand 1999c, 2006, 2015), the efficiency of public administrations in the face of crisis and emergency contexts (Farazmand 2017) and natural or man-made disasters. A priori unforeseen events such as the COVID-19 pandemic, September 11th, the devastation produced by the Katrina Hurricane (Farazmand 2009, 2016, 2017), or the Fukushima Nuclear Disaster (Suzuki and Kaneko 2016) have put in question the capacity of public institutions to respond quickly and adequately to this type of extreme events.

The controversial relationship between bureaucracy and democracy continues to be one of the cornerstones of the research that has been updated according to the present context (Farazmand 2010a, b) in which the influence of the elites (Farazmand 1999b) as well as the

privatization of public entities (Farazmand 2002) clearly demonstrates how the ideology or the lobbies constitute two basic factors in the development of Public Administration, given that they represent the eternal dialectic between the interests of the community and those of the pressure groups.

## Bibliometric Summary of the Main Lines of Research Related to Public Administration Throughout the Twentieth Century

Previously, other works have pointed out the main bibliometric keys of the Public Administration (see, i.e., Cuccurullo et al. 2013, 2016) and other related fields such as Corporate Social Responsibility (Bakker et al. 2005). However, this encyclopedia entry has employed a considerably longer period of study, and all the papers published during the twentieth century indexed in the "Scopus" bibliographic database that expressly includes the term "Public Administration" in their title. As indicated in Table 1, the period studied covers from 1906 to 2020, compiling a total of 4044 works, from 903 sources, and 6488 different authors.

The annual scientific production of the period considered is shown in Fig. 1, which reflects how only between 2011 and 2020 (1904 papers) more papers have been published than in the whole twentieth century (1363 papers). Next, Fig. 2 shows the global scope of research related to the Public Administration, highlighting those countries with the greatest number of papers (by considering the "corresponding author").

For its part, Fig. 3 details the annual citations in chronological order as averages: it must be taken into account that the greatest peaks usually correspond to events of special relevance. For example, the beginning of the 1950s coincides with the establishment of the welfare state in European countries devastated by World War II, the beginning of the 1990s with the fall of the former Soviet bloc, 2001 with the attacks of September 11, 2005, with the devastation caused by Hurricane Katrina (see Farazmand 2017), etc.

Table 2 summarizes the "Who's Who" of Public Administration research, summarizing the 20 authors with the highest scientific productivity in this field. Similarly, Table 3 displays the 10 most cited manuscripts throughout the period. Obviously, it can be observed how the subject matter treated in each particular is very different,

evidencing the multidisciplinary approach on which the Public Administration is based.

In this sense, Table 4 lists those keywords that are most often repeated throughout the period. Clearly, the term "Public Administration" per se predominates with ease over the others, but perhaps the most important aspect to take into account is the gradual assignment to this field of other terms, such as e-government, gender, teaching, information technology, or diversity, which

underline the "modernization" of the discipline toward other areas that, in principle, should not be related under the perspective of classic Public Administration.

The diversification and the greater number of topics dealt with are illustrated in Fig. 4, in which a co-occurrence analysis is visualized employing a conceptual structure map to group the co-occurrence of topics (performed by a Multiple Correspondence Analysis). In this way, three large groups can be defined which are homogeneous among themselves and heterogeneous concerning to the rest: "green" mainly related to geographical location (Denmark, United Kingdom, Eurasia, etc.), "red" with the co-occurrence of keywords as policy, education, learning, training, etc. and "blue" with other terms like human, man, woman, adult, health, etc.

## Conclusions

Since Pritchard (1969) demonstrated that bibliometrics is much more than "Statistical Bibliography," it has found a wide range of applications in many other specific areas of knowledge, and it is precisely in a conceptual field in constant evolution such as Public Administration where it can develop its functionality, by summarizing to the last expression the characteristic facts of this discipline. Through Bibliometrics, the innate curiosity of the public administration scholar can be satisfied by discovering unknown lines of research or by reviewing the main features of the majority literature in order to synthesize the past, present, and future of this field (see Farazmand 2011a), in the same way, that it concisely manifests the diversity of administrative models underlined by Farazmand (2015): "There is no single ideal model of governance for all seasons, applicable to all nations and communities worldwide."

The numerous topics revealed by this entry reveal that the objectives pursued by the Public Administration under the rule of Cyrus the Great or in the current USA remain essentially the same, hence this field is continuously reformulated and adapted to its socio-temporal context. Among these issues, there will always be present the mandatory reform of the administration in favor of the most disadvantaged social classes already contemplated by the Gracchus brothers or the creation of control elements that inhibit the corruption of public administrations, still taking into consideration the pertinent advice of P.C. Tacitus: "The more corrupt the state, the more numerous the laws."

# Public Attitudes and Corruption

Eric Raile
Montana State University, Bozeman, MT, USA

## Synonyms

Malfeasance, Bribery; Public opinion, Perceptions

## Introduction

As much as any other, corruption (defined most simply as using public resources in inappropriate ways for private profit) is a phenomenon for which perception may be reality. The fascination of economists and political economists with corruption in the 1990s and very early 2000s waned as they decided they had thoroughly identified all the causes and consequences of corruption. Whether explicitly acknowledged or not, public opinion was often an important part of such research due to the frequent use of perception-based measures of corruption. After a lull of a few years, more conventional political scientists and public administration scholars began to advance the knowledge base about public attitudes and corruption. While interest never fully went away, the issue area is experiencing something of a rebirth in a different form. Researchers are not alone in producing new knowledge. Practitioners (particularly those working on anti-corruption initiatives in governments) and the many nongovernmental organizations working on corruption issues around the world have contributed in significant ways to understanding, as well. Practitioners and advocates even have their own global meeting – the biennial International Anticorruption Conference (IACC).

The latest wave of discovery has emphasized democracy and governance and their connections to corruption. The attitudes of citizens and government workers (attitudes are used synonymously with public opinion here despite being associated with affect in the psychological literature) assume central importance in much of this work. One important question involves the ways in which corruption (including campaign finance) and corruption perceptions interact with acts of political participation like turning out to vote and selecting candidates. Partisanship often assumes a place of importance in studies of citizen evaluations of corruption and government performance. Another noteworthy area in recent scholarship pertains to the influence of the general state of the economy and government on corruption perceptions. Yet another important set of questions deals with complex relationships between trust or

confidence in government and corruption. The impacts of corruption perceptions on public administration itself constitute a final pillar of recent interest. Also worth noting is that much of the recent research has looked at Latin America, the Iberian Peninsula, and Central and Eastern Europe.

The heading of "public attitudes and corruption" potentially intersects with various concepts and bodies of research. In what follows, the first section considers challenges with the definition and measurement of corruption. The next section looks at some of the sources of public opinion data on corruption. The two subsequent sections examine the causes and consequences of corruption, with the understanding that much of the measurement involves public opinion data. Yet another section considers trust and confidence in government. A final section concludes and ponders extensions.

## Definition and Measurement of Corruption

The definition and measurement of corruption are notoriously challenging activities. One source of difficulty is the concealed nature of most corrupt acts. Politicians and public servants typically (though not always) try to hide corruption from the prying eyes of the citizenry, political opponents, and observers abroad. Another source of difficulty is that defining certain types of activities as corrupt can depend on cultural norms and other contextual factors. Tolerance for corrupt acts can also hinge on such contextual factors. Corruption laws may contain common categories (e.g., bribery, nepotism, conflicts of interest) across jurisdictions, but these laws are often more specifically reflective of what people see as problematic in their own countries or communities. Definitional challenges have also emerged prominently in international negotiations for anti-corruption agreements, including negotiations for the United Nations *Convention against Corruption*. One potentially helpful distinction of a broad nature is that between "political" corruption (i.e., corrupt acts committed by elected politicians) and "public" or "administrative" corruption (i.e., corrupt acts committed by bureaucrats). Another useful but general distinction is between "petty" or smaller acts of corruption typically committed by street-level bureaucrats and "grand" or more significant acts of corruption at higher levels of government. In terms of research measurement, scholars must either define corruption directly or must allow for research participants to define corruption for themselves.

The measurement of corruption proceeds using either perception-based indicators or objective/proxy indicators (Sík 2002). Objective indicators include observable phenomena like the number of investigations, prosecutions, or convictions as they relate to corrupt acts. A significant problem with objective indicators is that they depend considerably on how much effort government representatives are making to ferret out and punish corruption. Governments with more aggressive investigators, prosecutors, and judges may seem more corrupt by such metrics. The quality of proxy indicators (i.e., assessment of corruption indirectly through the measurement of variables thought related to corruption) is typically unknown. As a result, researchers and practitioners often must resort to using perceptions of businesspersons, citizens, and/or government workers to measure corruption. Many other variables that are not corruption itself can influence these perceptions, a significant topic that this entry takes up later.

While individual-level corruption perception data are also available (see below), a number of prominent indicators provide summary scores at the country level. Transparency International's *Corruption Perceptions Index* is perhaps the best known aggregate indicator and is often cited and discussed in the mass media. Transparency International, a nongovernmental organization with offices throughout the world, also produces a *Global Corruption Barometer*. The *Corruption Perceptions Index* provides a score ranging from 0 (most corrupt) to 100 (most clean) to each country, along with assessments of uncertainty for each score. The score applies only to the public sector and incorporates a number of surveys and assessments collected by a variety of organizations.

People working in business and country experts are the sources of the perceptions. Changes in the methodology over time have limited the ability to evaluate trends in corruption perceptions. The *Global Corruption Barometer* examines the perceptions of tens of thousands of citizens across dozens of countries. Questions deal with topics like experience with bribe paying, perceptions of corruption in institutions, and willingness to address corruption problems. The data are reported collectively, however.

The World Bank's *Control of Corruption* indicator is an alternative that arises from the Worldwide Governance Indicators project. This indicator, which is highly correlated with the *Corruption Perceptions Index*, draws on dozens of different data sources and measures various forms of corruption and government capture. The World Bank Group also conducts *Enterprise Surveys* of tens of thousands of firms in dozens of countries, and these surveys ask questions about experiences with bribery and gift giving. Researchers have used Transparency International's *Corruption Perceptions Index* and the World Bank's *Control of Corruption* indicator extensively in cross-national work. The International Country Risk Guide, produced by a for-profit group, also includes an aggregate indicator that appears occasionally in academic corruption research.

These aggregate indicators generally show problems with corruption throughout much of the world, with countries in Africa, Asia, and Latin America having particularly high perceived levels of corruption. Western Europe, North America, Australia, Japan, and a few other countries have relatively low levels of perceived corruption. These geographic patterns suggest relatively straightforward relationships among democracy, wealth, and levels of perceived corruption, but more sophisticated research reveals a number of contingencies and complications in these relationships.

Researchers and practitioners have raised questions about the validity of perception-based measures even beyond the noncorruption sources of such perceptions. Some of the indicators depend on the views of successful business persons or other elites. These are people who are fundamentally different from everyday citizens in a variety of important and consequential ways. They are likely to see and define corruption differently and to have working relationships with one another. Another concern with perceptions is that people in different countries may use different scales or definitions for corruption, which makes cross-national comparison a difficult enterprise. Language translation issues only add to such concerns. Partisanship, too, can color individual corruption perceptions in ways that change corruption definitions across individuals. Worries over the more general perception-based measures have nudged scholars in new directions. Recent research has instead defined corruption more specifically through phenomena like campaign finance, informal cash payments for healthcare, and electoral manipulation.

## Public Opinion Data

Public opinion or survey data on corruption tend to take one of two forms: (1) perceptions of the frequency and/or severity of corruption in the local or national context or (2) information about an individual's direct experiences with corruption. The corruption perception items often ask whether corruption is "widespread" or "pervasive" in either government or business. Alternative questions ask how "big" or "severe" the problem of corruption is or how "concerned" the respondent is about corruption. Other items simply ask whether certain entities or institutions are "corrupt" or whether the respondent expects corruption in government to improve. Interestingly, questions about concern and about the problem of corruption are really tapping into two different evaluations. The first involves the severity of corruption (in the respondent's estimation) and the second whether the level of corruption is consequential or meaningful. Yet another type of item asks where anticorruption efforts should rank among government priorities. As for the other basic format, the items dealing with corruption experiences typically ask whether individuals have had direct experience with corruption.

Often such questions focus on being shaken down for bribes or gifts. Alternative questions ask about the frequency of respondent experiences with corruption or the conditions under which these experiences occur.

Gallup and the Pew Research Center (both domestically and through its Global Attitudes Project) are the polling entities that have delved most consistently into corruption questions in the US and on a global basis. The World Values Survey has also asked about corruption across dozens of countries in a few of its waves. In recent years, a number of regional survey efforts have incorporated corruption indicators into their instruments. Such regional efforts include the Eurobarometer, the Afrobarometer, the Latinobarómetro, and the Asian Barometer. The Eurobarometer even conducted a special survey on corruption.

In terms of US polling research, public opinion polls have revealed perceptions of widespread corruption despite a generally respectable standing on this issue globally. Majorities see the US Congress as corrupt, though Americans are a bit less likely to see their own representatives as corrupt. These negative perceptions have started to spread to more local levels of government. Americans have started to see the reduction of corruption as a more important priority for government, as well. Globally, corruption is viewed as widespread in government and business in the vast majority of countries polled, despite real efforts at beefing up transparency and anti-corruption programs in many countries. The importance of addressing corruption varies across countries but doing so is often a high priority. An increase in concern about corruption is evident particularly in developing countries in recent years. As with the other data sources (like Gallup and Pew), the various barometers have generally shown significant concern about government corruption in countries throughout the world.

## Causes of (Perceptions of) Corruption

Given the popularity of perception-based measurement, scholarship on the causes of corruption also doubles to some extent as an explanation of the sources or "causes" of perceptions of corruption. The scholarship does not always recognize this in an explicit way, however. The following paragraphs consider the ways in which press freedom, government and economic institutions, characteristics of the survey respondent, general conditions in the country, and other factors can influence corruption perceptions.

Importantly, many of the sources of perceived corruption may have no direct connection to the level or severity of corruption itself (see Miller 2006) – an observation that generates a good deal of complaint about perception-based measures. On the one hand, this means that perception-based measurement of corruption likely entails a lot of measurement error. On the other hand, the perceptions themselves might be even more important for political behavior and governance outcomes than actual corruption. An obvious place to start in thinking about other influences on corruption perceptions is media freedom and the extent of media coverage of corruption. A free press can promote both accuracy and inaccuracy in citizen corruption perceptions. While a free press can certainly expose real and severe corruption problems, the "priming" or frequent coverage of corruption scandals can also lead to overestimation of the extent and severity of corruption. Exposure to corruption reports from other places may add to these priming effects despite their general irrelevance to the local context. Priming effects help explain the particular tendency for populations in relatively clean countries to overestimate corruption. Fortunately, emerging research from developing countries suggests that citizens can sometimes distinguish between rumor mongering and substantive corruption claims, though state-run media achieve some success in reducing corruption perceptions.

Government transparency, sometimes considered a measure of corruption in itself, can similarly influence the accuracy of perceptions in both directions. Transparency mechanisms (e.g., financial disclosure, campaign finance laws, open meeting laws, publication of draft regulations) can reveal corruption in ways that lead to overestimation of the problem among citizens. Other

accountability mechanisms can have the same counterintuitive impact. For example, different political actors may pursue corruption charges against one another in a regime with many checks and balances. Additionally, well-run and independent systems for the investigation and prosecution of corrupt acts can inflate problem perceptions. Mechanisms for information revelation and the establishment of high standards contribute to the "expectations gap" (Dalton 2005) in relatively well-run states. The expectations gap is another way of characterizing the way good performance creates higher thresholds for acceptable future performance. Quite logically, improved perceptions of the effectiveness of a government's anticorruption programs also lower the level of perceived corruption.

Characteristics of the individual, too, can affect corruption perceptions. The flip side of media reporting is the attentiveness and knowledge of media consumers. "Political sophistication," which is typically the education, attentiveness to certain information sources, or level of knowledge of citizens, is highly important to corruption perceptions. The effects of political sophistication differ based on particular contexts, though some research adds to the argument that citizen knowledge about government anticorruption efforts can lower perceptions of corruption. An individual's level of political participation functions similarly to political sophistication as a measure of engagement. The views shared in other information networks (e.g., friends and family) and the spreading of anecdotal information could also influence corruption perceptions. Further, the personal moral character of the individual and of peers can affect corruption perceptions. More specifically, these factors can shape the individual's views of what types of activities are normatively acceptable (i.e., appropriate or noncorrupt). Finally, and quite in line with rational-choice predictions, those individuals who benefit from corruption in government tend to see such corruption as less problematic or as less of a concern.

One particular finding in corruption perception scholarship merits special attention given its recent emergence – the influence of more general well-being on individual corruption perceptions. Surprisingly, personal experiences with corruption (e.g., paying bribes) often do not directly predict concern about corruption or perceptions of the problem of corruption. These direct experiences with corruption might work indirectly on corruption perceptions through trust in government or other assessments of government, though. Instead, more general evaluations, particularly of the economy, serve as a contagion of sort for corruption perceptions and are much more predictive of individual corruption assessments.

Citizens often see corruption as less of a problem when the macroeconomy is doing well (either by objective or subjective indicators), a relationship that may be more acute in nondemocratic systems. The macro situation is consistently more important to corruption evaluations than are objective or subjective economic conditions for the individual doing the evaluating (e.g., personal income, unemployment, changes in financial status). What remains unknown at this point is whether this general contagion represents something real. Corruption negatively affects a range of economic outcomes (see below). Consequently, corruption perceptions might simply reflect the worsening of macroeconomic conditions caused by corruption itself. However, perception-based measurement of corruption introduces a circularity here. In many cases, negative perceptions of corruption "produce" bad macroeconomic performance, which in turn leads to negative perceptions of corruption. More accurate measures of actual corruption would be necessary to sort out the causality.

Generalized evaluations of government quality, government performance, and the level of democracy seem to work similarly. The theoretical connections here are more direct and logical than with macroeconomic conditions, however. Perceptions of corruption move along with individual evaluations of government quality and performance. In other words, an individual who perceives a high level of corruption probably does not think much about the government's features and activities as a whole. The case of democracy is more complex. Depending on the measurement of democracy, some research suggests a nonlinear relationship in which perceptions of corruption are highest in

countries with middling democratic qualities (e.g., Montinola and Jackman 2002). Authoritarian regimes, usually through controlled information flows, can hide or muddle views about corruption. Survey respondents living in authoritarian regimes might also fear giving accurate answers. Despite the expectations gap, more democratic countries may show a relatively low level of perceived corruption based on the general absence of corruption itself. This nonlinearity could be due to the length of exposure to democracy and/or the way the democratization process reveals information and enhances government transparency. Regimes in the middle of the democratization process are subject to some instability and often allow significant revelation of corruption for the first time.

A variety of other political and economic institutions (see Aidt 2003; Gerring and Thacker 2004) also affect government accountability and behavioral incentives for both government employees and citizens. These institutions, consequently, can influence both actual and perceived levels of corruption. Such political institutions include the basic regime characteristics in a democracy and the shape of the electoral system. Important to the former are the form of democratic government (e.g., parliamentary, presidential, hybrid) and the distribution of power in the regime (e.g., unitary versus federal). Whether citizens vote for parties or candidates and whether partisan representation in the legislature is proportional to vote share are important considerations for the electoral system. On the economic side, the structure of the economy seems to matter to actual and perceived corruption. Economic protectionism (i.e., sheltering of domestic firms from competition coming from abroad) and monopolistic or oligarchic behavior (i.e., dominance of certain sectors by a small number of firms) can both provide opportunities for corruption to thrive.

Finally, "cultural" hypotheses (e.g., religion, work ethic) about the sources of corruption have long been popular (see Treisman 2000). The observation that some regions have higher perceived corruption than other regions is not particularly helpful in itself and can lead to discriminatory claims with little basis. Where such hypotheses do seem to hold water is in their examination of history and social characteristics. Corruption does exhibit historical path dependence, meaning that levels tend to persist over time. Additionally, a lack of "social capital" (interactive ties among citizens), sources of social conflict like strong ethnic identification, and weak social norms about corruption can all boost corruption perceptions.

## Consequences of (Perceptions of) Corruption

As with corruption causes, the popularity of perception-based measurement means that much research about consequences of corruption is really about the effects of corruption perceptions. Dominant is the view that corruption has negative consequences for economies, societies, and political systems, though some economists believe markets are much more important to outcomes. Corruption can complicate governance in a variety of ways and can influence voting and other important behaviors.

The "revisionist" view of corruption (see discussion in Lancaster and Montinola 2001) has proposed that corruption improves economic efficiency by better allocating resources and by improving interactions between the public and private sectors. Willingness and ability to pay are key elements of free market economics, and bribes can provide similar signals for government activities according to this way of thinking. Corruption might also ease governance by increasing support for politicians. However, the preponderance of the evidence (see Rose-Ackerman 1999, 2002; Rothstein 2011) strongly suggests that corruption produces a variety of negative consequences. Some of the negative socioeconomic consequences of corruption show up at the macro level, with effects on poverty, inequality, and per capita incomes. Corruption is especially bad for poor people. The willingness of foreign capital to enter a country also depends to some extent on the degree of corruption in that country. Many investors are reluctant to provide capital when certain costs are illegal and can go up arbitrarily through bribery demands. Moving

downward, negative effects appear at the firm (i.e., individual company) level with incentives to monopolize and obstacles for entrepreneurs and small businesses that are less able to pay the costs of corruption.

Corruption (and corruption perceptions) can also make certain functions of governance more difficult, particularly in regimes with democratic characteristics or aspirations. Corruption is a marker of a nonprofessionalized bureaucracy, which is a drag on governing efficiently and effectively. The historical move to a competent, merit-based civil service was a major development for many governments around the world. As discussed earlier, perceptions of corruption among the general population also tend to worsen their evaluations of government performance and legitimacy. If a government does not provide what the people want, the citizenry can become angry or alienated and can give up on government. Further, corruption distorts the public policy process by reducing the influence of democratic demands, altering investment decisions, and changing the revenue base for social spending (though these are all effects of *actual* corruption). Finally, corruption also tends to violate important norms and values that are important to democracy, like inclusiveness and equity. Citizens often dislike such norm violations.

Answering the foregoing types of questions has served as a foundation for newer, relatively complex questions about the behavioral and attitudinal effects of corruption, corruption perceptions, and experiences with corruption. What has resulted from the significant attempts in many countries to spread the news about corruption and from people's own observations of its harms? In particular, people naturally wonder whether corruption affects the electoral process in democratic or relatively democratic regimes. The most popular questions of late concern the effects of corruption on voter turnout and vote choice. Not surprisingly, corruption often diminishes the likelihood that individuals will go to the polls. People believe that their vote is meaningless if the entire system is corrupt. The likelihood of voting may increase when people believe non-corrupt alternatives are available, however.

The effects of corruption perceptions on vote choice are contingent on a range of factors. Whether voters punish corrupt politicians and parties can depend on individual voter characteristics that include political sophistication and informedness, partisan identification, and ideological views. Other factors can also condition the linkage between corruption perceptions and vote choice, including the overall level of corruption in the country (i.e., whether corruption is standard business), media coverage of a scandal, the general state of the economy, and the provision of social benefits. The latter two factors indicate that some voters can be "bought." Though nonvoting questions have attracted less attention, the evidence also suggests that higher levels of perceived corruption produce support for campaign finance reform and reduce willingness to obey laws (like those that require the payment of taxes).

## Trust and Confidence in Government

Conceptually, trust and confidence in government have a great deal in common with evaluations of government corruption and performance. Disentangling these concepts can be difficult theoretically and in the public opinion data. In fact, survey respondents often appear to use these concepts as proxies for one another. Attempts at sorting out these relationships have expanded dramatically in the last few years, typically finding common-sense relationships among the variables. Low trust, low confidence in government, and low evaluations of government performance often go hand in hand with perceptions of high levels of corruption. The literature also finds complex interactions and contingencies, however. The expectations gap evident in corruption perceptions also materializes with confidence in government institutions. In other words, some countries with more democratic institutions suffer from lower citizen evaluations of the democratic nature or performance of those institutions.

Trust can take a number of different forms. While trust in government or in specific government institutions is not quite the same as

confidence in government, the two concepts sometimes are used interchangeably. Trust in government is not the same as social trust (i.e., trust in other people), however. Social trust further breaks down into particular trust, which is trusting other people in your in-group about whom you have information, and general trust, which is trusting people more generally (Newton and Zmerli 2011). Not surprisingly, trust and confidence in government can serve as capital for government action. For example, more trusting citizens may be more willing to pay taxes and make other sacrifices. Perceptions of corruption again seem to mean more than personal experiences with corruption in this web of relationships, though experiences also matter. Similarly, perceptions of process (i.e., how government works) seem more important than perceptions of government outcomes. In terms of specific institutions, the military tends to receive the greatest vote of confidence in polling across countries, while confidence in the judiciary varies widely. Many have claimed a near global drop in confidence in government in recent decades, though more careful analysis suggests more regional and temporal variation (see Norris 2011). However you slice the data, the single-digit approval ratings (under 10%) for institutions like the US Congress in recent years are not good news for democracy.

## Conclusion

Corruption is a topic that stretches back to the very advent of government, but the strong impulse to do something significant about corruption is more of a development of the last several decades in most of the world. Despite the late start, corruption is a relatively mature issue area with decades of intense interest from both academics and practitioners. Empirically, a few vexing areas remain. The first is the ability of many authoritarian regimes to act in corrupt ways with impunity even when the citizenry suffers as a result and dislikes the corrupt activities. The second is the willingness of some citizens to support corrupt politicians and government employees regardless of the regime type. The third involves the way democratization and greater transparency and accountability mechanisms can worsen citizen evaluations of government. These areas will likely continue to stoke interest in the topic of public attitudes and corruption. Given the tendency of corruption to benefit a small group of individuals at the expense of many others in a society, the recent upsurge in interest in social inequality should keep corruption in the spotlight, as well.

The inability to measure corruption directly always has been and continues to be problematic. However, as proposed earlier, perceptions of corruption might be even more important for political, economic, and social outcomes than are actual levels of corruption in a jurisdiction. These perceptions can drive behaviors, whether related to voting, support of government, or willingness to invest or make sacrifices. A great unanswered question is just how the variety of international anticorruption agreements and mass media coverage of corruption will affect public attitudes as they relate to corruption in the longer term. Citizens have unprecedented levels of information and resources to help them deal with corruption if they so desire.

# Public Budgeting in Africa in the Post-Recovery Period

Emmanuel Botlhale
Department of Political and Administrative Studies, University of Botswana, Gaborone, Botswana

## Synonyms

Allocation; Financial plan; Fiscal estimate; Planned disbursement; Spending plan

## Definition

A budget is an estimate of revenues and expenditure by economic agents be they individuals, households, firms, or governments. Once approved by the legislature upon which reposes the power of the purse, the budget gives the executive arm of the government the authority to raise revenues (primarily, through taxation) and appropriate money from the *fiscus*.

## Introduction

Resource scarcity forces rational economic agents such as governments to prioritize resource allocation. One of the principal ways of prioritizing resource allocation is through the budget. In essence, the budget seeks to answer the all-important question: who gets what? Just like politics seeks to answer "who gets what? when? how?," the budget similarly answers these questions. Thus, by examining a public budget, one gets to understand the following: (i) who gets what? (ii) when? and (iii) how? An examination of the public budget gives one an indication about the government's priorities. For example, does it care for vulnerable subpopulations like children, women and the girl children, and poor? Since these questions are asked and answered in a political process and also given the fact that politicians (e.g, members of Congress) are invested with the power of the purse, public budgeting is a very political exercise. Due to the politics that attends to public budgeting, budget allocation, like all public decision-making processes, entails a lot of bargaining and horse trading. Thus, public budgeting is, quintessentially, a political rather than a technocratic exercise. Hence, it is not an entirely rational exercise as would be expected of rational and utility-maximizing economic agents such as governments. Besides the politics (e.g., see Wildavsky 1984), public budgeting happens in a given context: economic, social, and political. The economic environment has serious implications for public budgeting. The most recent and evident economic circumstance is the global economic crisis. Therefore, in the post-recovery period, there is a need to reconfigure the architecture of public budgeting. This is particularly true in Africa where public budgetary systems are evolving and budget reform is yet to take root.

## The Ecology of Public Budgeting

Public budgeting does not happen in a theoretical vacuum. It happens within a given context (or environment) that comprises the economic, social, and political. While all the three are all important, the former (economic) is the most important one. This is so because for the budget to take effect, it needs to be resourced. In fact, the relationship can be formulaically stated as:

$$\text{Budget} = f\ (\text{resources}).$$

The resources are the inputs, principally tax revenues, which are at the disposal of the government. In formulating the budget, the Treasury (or Finance Ministry) must estimate revenues that it realistically hopes to raise in the upcoming financial year. Revenue estimation is both science and art. The sciences in revenue estimation are tools which are both qualitative (e.g., Delphi approach, scenario writing, and subjective or interactive approaches) and quantitative (e.g., time series analysis and explanatory models [the foremost example being regression analysis]). The art, mainly, relates to assumptions that are built into revenue estimation models. Examples are general state of the global economy, geopolitics, inflation, volume of exports (e.g., diamonds in Botswana and oil in Nigeria), national productivity levels, etc. Both the science and art go into revenue estimation, and, in a majority of cases, revenue forecasts are wrong. Hence, when speaking about the uncertainty in revenue forecasting, the former Director of the Ohio Legislative Budget Office said, "the only thing we know for sure is that this forecast will be wrong. We don't know how much or in what direction, but it will be wrong" (quoted in Shkurti 2003). Despite expected errors, forecasts must very closely approximate reality for "an overly overoptimistic forecast may subsequently require budget cuts, or additional taxes or both" (Shkurti 2003, p. 79). Inversely, "a pessimistic forecast may trigger a political controversy over the size of the budget surplus, or may encourage additional spending that cannot be sustained in the future" (*ibid*).

Despite these challenges, Treasury officials must prepare revenue estimates to guide the preparation of budgets by paying attention to the external environment, particularly the economic one. To exemplify, when laying the 2015/2016 Budget Speech before parliament on 2 February 2015, then Botswana's Minister of Finance and Development Planning stated that the projected total revenues and grants for 2015/2016 amounted to 55.38 billion Botswana pula (Mathambo 2015) (At the time of writing this chapter, 31 January 2017, 1 Botswana Pula = 0.094 US Dollar. Therefore, 55.38 billion Botswana Pula = 5.19 billion US Dollars.). Mineral revenue accounted for 34.4%, Customs and Excise for 29.5%, while Non-mineral Income Tax accounted for 17.5%. Mineral revenues were projected to grow by 10.4% from P17.24 billion in 2014/2015 to P19.03 billion in 2015/2016 (*ibid*). Owing to events in both the local and external economies (mainly, subdued demand for diamonds and falling prices), the forecast was revised to P51.69 billion, a downward revision of 6.7% (Ministry of Finance and Development Planning 2015).

## Global Economic Crisis and Fiscal Stress

All economies experience substantial swings in economic activity due to business cycles (or economic cycles). The business cycle is the short-term fluctuation of total output around its trend path (Begg et al. 2011, p. 614). Business cycles are instanced by alternating periods of expansion and contraction. Business cycles have four distinct phases: (i) expansion (gross domestic product [GDP] is rapidly increasing), (ii) peak (the highest point on the GDP curve), (iii) contraction (GDP is rapidly decreasing), and (iv) trough (the lowest point on the GDP curve). While the term business cycle (or economic cycle) seems to suggest regularity in respect to the timing and duration of expansion (upswing) and contraction (downswing), this is not necessarily the case. It has been observed over time that there is irregularity in both the timing and duration of these

business cycles as sufficiently instanced by the recent global economic crisis which has seen slow recovery.

Within a year of the beginning of the global financial crisis that started in late 2007, it metamorphosed into a global economic crisis. The developing world, though not the author of the global financial crisis, disproportionately felt its effects. Mainly, most developing economies are reliant on primary products. Examples are crude oil (in this category, are countries such as Algeria, Angola, Egypt, Libya, and Nigeria) and base metals (e.g, diamonds in Botswana – it is the biggest diamond-producing country by carat value in the world). With the onset of the global economic crisis, primary products faced falling prices in the international commodity markets. To exemplify, the effects of the global economic crisis were visited on Botswana in living color in November 2008 when, for the first time since selling diamonds beginning in the early 1970s, it failed to sell a single diamond (Gaolathe 2009). This forced the government to stockpile diamonds with the hope that prices would bounce back to pre-2008 levels, if not better. The ultimate effect was a reduced revenue envelope, therefore, forcing the choice of budget deficits into the hands of the government beginning in the 2008/2009 financial year. Budget deficits continued until the 2012/2013 financial year when balances were restored with modest surpluses. However, the continued subdued demand for diamonds resulted in budget deficits in the 2015/2016 financial year, and this situation is forecast to obtain until the 2019/2020 financial year. Vital to note, the Botswana experience has been replicated in primary product-reliant economies in Africa, thus, occasioning fiscal stress as adequately instanced in budget deficits in the post-2008 period.

## Global Economic Crisis and Budget Reforms

Economic crises, although denoting a period rife with trials, provide an opportunity for the introduction of public financial management and budget reforms. One of the key public financial management and budget reforms that came about as a result of the global economic crisis was the Public Expenditure and Financial Accountability (PEFA) assessment. The PEFA assessment evaluates the status of public financial management in a country. It identifies 94 characteristics (dimensions) across 31 key components of public financial management (indicators) in seven broad areas of activity [pillars] (PEFA 2016). The assessment provides a full and evidence-based analysis of Public Finance Management performance at a specific point in time in a given country. The project is a multiagency partnership program that is sponsored by the following: the World Bank, International Monetary Fund, European Commission, United Kingdom's Department for International Development, French Ministry of Foreign Affairs, Royal Norwegian Ministry of Foreign Affairs, Swiss State Secretariat for Economic Affairs, and Strategic Partnership with Africa. PEFA assessments evaluate a country's Public Finance Management systems on the following: (i) credibility of the budget; (ii) comprehensiveness and transparency [of the budget]; (iii) policy-based budgeting; (iv) predictability and control in budget execution; (v) accounting, recording, and reporting; and (vi) external scrutiny and audit. Currently, 546 PEFA assessments have been carried out worldwide, and 31 are planned for the future. In terms of the usefulness of the exercise, government officials, for example, in Brazil (Santa Catarina State), Cambodia, Costa Rica, Liberia, Morocco, Nepal, Papua New Guinea, and Timor-Leste, have described how they used the results of PEFA assessments to inform financial management reform programs (*ibid*).

PEFA performance assessments lead to Public Finance Management Reform Programs. To illustrate, following the inaugural PEFA performance assessment in 2009, the government of Botswana introduced public finance reforms in the form of a Public Finance Management (PFM) Reform Programme for Botswana in 2010. The overarching goal of Botswana's PFM Reform Programme is to ensure optimal utilization of public resources for long-term sustainable development. The second PEFA performance assessment was conducted in

2013. Feedback from the two PEFA performance assessments is inputted into the Public Finance Management Reform Programme for Botswana. While it is not true that all African countries undertook PEFA performance assessments in the post-2007 period to inform Public Finance Management Reform Programs like Botswana did, some countries undertook such assessments as next illustrated. South Africa undertook the PEFA performance assessment in 2008. The same was undertaken in 2012 in some of the following countries: Kenya, Lesotho, and Liberia. While some, for instance, South Africa, had been implementing the Public Finance Management Reform Program prior to 2007 (2004 in this case), PEFA performance assessments post-2007 were particularly useful because they helped to shape policy debates around Public Finance Management Reform Programs.

## Public Budgeting in Africa in the Post-Recovery Period

It is notable that the last global economic crisis is, in many ways, different from other crises like the LatAm sovereign debt crisis (1982), savings and loans crisis (1980s), stock market crash (1987), junk bond crash (1989), Tequila crisis (1994), Asia crisis (1997–1998), and Dotcom bubble (1999–2000). This is so because while there was recovery from these crises, this is not entirely true of the past immediate global economic crisis. Eight years after the onset of the crisis, recovery is very illusive; it is either very slow or unsteady and uneven as sufficiently instanced by reports by the International Monetary Funds. In fact, some economists have argued that the global economic crisis necessitates a major rethink in terms of the economics of business cycles (or economic cycles). That is, they argue that the global economy will, in future, be in a state of permanent crisis, only punctuated by brief periods of modest recovery. In this regard, global economic outlooks by, among others, the International Monetary Fund are not inspiring (IMF 2016). For instance, global growth was projected to slow to 3.1% in 2016 before recovering to 3.4% in 2017 (*ibid*). This does not compare with pre-2007 forecasts. So, this gives impetus to the theory of permanent global economic crises as opposed to alternating periods of expansion and contraction.

Given the uncertainty of recovery post-2007, coupled with current budgetary pressures on the part of primary product-reliant African economies (e.g, Botswana is a diamond reliant), there is a need to rethink public budgeting. While some African countries have conducted PEFA performance assessments and inaugurated Public Finance Management Reform Programs, overall, the effect of these initiatives is yet to bear commendable fruit. Hence, budget reform is very critical in Africa. Reform is not an event; it is a process that is multilayered, multidimensional, and multi-stakeholder. Among others, reform is about engendering the 3Es of management: (i) effectiveness, (ii) efficiency, and (iii) economy. Beyond the 3Es of management, budget reform is about enhancing budget legitimacy (the budget process conforming to the law or to rules, particularly, the constitution and public financial management and budget laws) and accountability. Of particular note, accountability is key in the use of public resources by one party on behalf of the other. In this regard, in a principal-agent relationship with the citizens and the executive arm of the government being principal and agent, respectively, it is imperative that the agent accounts to the principal. This becomes more imperative in days characterized by New Public Management that, on the one hand, gives Public Managers a wide berth of discretion to run public agencies like a business and demands more accountability of them on the other. Hence, in the post-recovery period, there is a need to strive for the pursuit of the Holy Grail of the 3Es of management and cognate ideals such as budget legitimacy and accountability.

## The New Face of Public Budgeting in Africa

In view of chronic recovery challenges, budget reform is very imperative. In this regard, there are already waves of budget reform in the world.

For example, in the wake of the global financial crisis, budgeting techniques are undergoing major change in many Organisation for Economic Co-operation and Development countries (Robinson 2016). Therefore, a majority of pre-crisis budgeting techniques have to be revised, reformed, and reorientated in view of reduced fiscal envelopes. Given Africa's yet-to-be developed public budgetary systems, there is a need to found an architecture within which to ground future public budget reforms. The following are some policy options to consider in reforming the budgetary process in Africa.

*Expenditure re-prioritization*: the budget must truly represent the priorities of the nation as expressed through participatory budgeting. In a majority of African countries, the power of the purse, which James Madison in *Federalist Paper No. 58* published on 20 February 1788 described as "the most complete and effectual weapon with which any constitution can arm the immediate representatives of the people. . .," is more honored in the breach than in the observance. In the main, this is due to the dominance of the executive arm of the government over the legislature. The executive dominates policy-making, critically and very ruinously, including budget formulation. In most instances, the executive budget proposal reflects the priorities of the executive, for instance, defense spending and executive pet projects (e.g, vote-buying populist projects such as antipoverty initiatives). In view of reduced fiscal circumstances, there is a need to re-prioritize public expenditure to ensure allocative efficiency. In a related vein, the power of the purse must be made a reality as affirmed in the US Congressional Budget and Impoundment Control Act of 1974 which effectively upheld the basic principle that Congress was inviolably vested with the power to direct federal spending, so, ending President Richard Nixon's abuse of impoundment powers.

*Fiscal discipline*: although the principle has been debated by preeminent public finance theorists such as James Buchanan and Richard Musgrave, and latterly John Mikesell, it found outmost expression in the Washington Consensus. John Williamson (2004), who coined the term "Washington Consensus", prescribed fiscal discipline in times of austerity. In essence, it means the government staying the course of smooth financial operation and long-term fiscal health. Thus, unless there is a necessity to run deficits, for example, to stimulate the economy, there must be fiscal discipline. Among others, this will ensure the 3Es of management.

*Accountability for budget performance*: in the era of New Public Management and New Public Governance where Managers are given a wide discretion to run public agencies like businesses, the increased need for accountability for performance, in terms of results and non-results, is imperative. In this regard, Heads of Departments, or Agency Heads, need to be held accountable for department/agency budget performance. In the event that Heads of Departments or Agency Heads fail to deliver on budget goals and targets without good reason, they must be held to account and be appropriately sanctioned (including dismissal).

*Performance-based budgeting*: this refers to the relationship between program funding levels and expected results and/or deliverables from the program. In essence, it adopts the logical framework that links four variables, being: (i) inputs (things that go into a program), (ii) outputs (deliverables; e.g., a road), (iii) outcomes (short- to medium-term changes), and (iv) impact (long-term changes). In most cases, existing budget practices focus on the first two: (i) inputs and (ii) outputs. While the same are easy and lower hanging fruit, the last two (outcomes and impacts) are not. Therefore, there is a need to ensure budget outcomes and impact through performance-based budgeting. Hence, rather than the Treasury simply requesting parliament to give it x amount of Dollars, it must think of all the four variables.

*Charter of Budget Honesty Act*: there is a need to take a leaf from the Australian government and promulgate Charter of Budget Honesty Acts. The Charter of Budget Honesty Act (1998) provides a framework for the conduct of Australian Government fiscal policy (Australian Government 2012). It aims to improve fiscal policy outcomes; thus, it provides that fiscal strategy be based on principles of sound fiscal management (*ibid*). In addition, the Act provides for the public scrutiny of fiscal policy and performance. It is evident from, among others, the Open Budget Surveys conducted by

the International Budget Partnership (the latest one in 2015) that a majority of African governments (including Botswana) are not doing very well in terms of open and honest budgets. So, the promulgation of an Australian-type Charter of Budget Honesty Act will go a long way in promoting honest budgets. Vitally, the Australian Charter need not be copied wholly; thus, it must be adapted to local conditions.

*Collaboration*: given the fact that some regions, for example, the Organisation for Economic Co-operation and Development (OECD) countries, have made tremendous strides in budget reforms, there is a need for more collaboration with them. Presently, there is cooperation between the Collaborative Africa Budget Reform Initiative (CABRI) and the OECD network of Senior Budget Officials (SBOs). The SBOs participate in CABRI seminars. Given the fact that one of CABRI's aims is to contribute to a common African resource base for African officials on public financial management, there is a need for more alliances with the OECD.

*Champion of Budget Reforms*: reform is very heavily freighted with challenges, the most pernicious one being resistance due to fear of the unknown. Therefore, it is very important to engender buy-in at the top. This involves the first office, for example, the Office of the President or the Office of the Prime Minister. If the President or Prime Minister is made the champion of reforms, this will ensure buy-in at the highest levels. In this regard, there is a precedent for this as exemplified by the National Performance Review in the USA. The National Performance Review was the initiative of the Clinton-Gore administration with the sole aim of reforming the way the federal government worked to make it "work better and costs less." The program was able to gain traction because it was driven from the Office of the Vice-President by then Vice-President, Al Gore. Similarly, in Botswana, the National Strategy Office is in the process of formulating a National Monitoring and Evaluation Framework for Botswana, and it requested the President to be its champion. Consequently, for budget reforms to succeed in Africa, and elsewhere in the developing world, they need to be championed from the first office. Doing so will ensure top-level buy-in and support and the deploying of requisite resources, particularly human and financial, to deliver the much-needed budget reforms in Africa.

## Conclusion

Budgeting is an important public resource allocation mechanism that, among others, decides the question: who eats? (and, alternatively, who does not eat?). The allocation of public resources to satisfy citizens' needs and wants is done in a given social, economic, and political environment. The economic environment is the most critical because money must be found to resource the budget. Therefore, in periods characterized by fiscal stress as it is noticeably happening in the post-2007 period, there is a need to do things very differently. Thus, pre-2007 budgeting practices cannot deal with issues posed by reduced fiscal circumstances. Fiscal stress is most acute in African countries whose economies are primary product reliant. Post-2007, there is subdued demand and falling prices for primary products. This, therefore, puts a big squeeze on African economies. The most obvious effect is reduced revenues that necessitate that there be cutback budgeting and insistence on the ethic of "the biggest bang for the buck." Therefore, budget reform is pertinent in Africa to cope with post-recovery revenue challenges. Very vital to note, budget reform is multi-level, multidimensional and multi-stakeholder. Therefore, the following are key to budget reform: expenditure re-prioritization, fiscal discipline, accountability for budget performance, performance-based budgeting, promulgation of Australian-type Charter of Budget Honesty Acts, and collaboration and the appointment of high-level champions of budget reforms. Adopting some of these initiatives will aid budget reform in Africa.

# Public Bureaucracy and Crisis Management

Neal Turpin
University of Louisville, Louisville, KY, USA

## Synonyms

Agencies; Government; Organizations; Public Administration

## Definition

A public bureaucracy is a governmental organization, staffed by professionals, which carries out administrative functions in a specific policy area.

## Introduction

The term bureaucracy often elicits images of paperwork, red tape, and glacially slow action. The thought of relying on these institutions to handle an urgent crisis can be worrying. No one wants to wait for a committee to convene or papers to be filed before a search and rescue operation gets underway.

Fortunately, these concerns are typically overblown, and public bureaucracies do their job well. Public administrators have the necessary skills, responsibility, and authority to step in when crises arise. They are the first lines of defense in both crisis prevention and crisis management. Bureaucratic missteps certainly happen. Disaster relief agencies sometimes respond slowly to hurricanes. Economic agencies can make incorrect predictions about job growth. These events are exceptions, though, not the rule. As a whole, public bureaucracies and agencies are effective and vital to how society functions.

## Bureaucracy and Crisis

Multiple organizations fall into the category of public bureaucracy, including local water departments, FEMA, the US Army, and the CDC. Public administrators include positions from line workers to Cabinet level offices. Public administrators in general are responsible for executing policy goals expressed by legislators or other elected officials. Many of the goals these agencies are tasked with carrying out have to do with either improving society or keeping it running smoothly. In this sense, managing crises that affect the public is a fundamental part of any bureaucracy's purpose.

What constitutes a crisis may vary greatly depending on what level of public bureaucracy is being examined. At the local level, a snow storm or a power outage may be considered a crisis. At the state level, floods, drought, or tornadoes are likely issues. At the national level, economic or military issues may be more of a concern. Of course, local governments can

experience economic crises just as easily as the federal government. A factory closing or a weaker municipal bond rating could be devastating for a local economy. Additionally, any crisis could potentially be too large for one level of government to handle on their own. A hurricane could be dealt with by just one state. However, a larger, more powerful storm may require federal administrators to lend assistance.

It may be the case that some crises are simply beyond the control of any public agency. There is only so much that can be done to prepare for or manage a volcano, for example. Geologists can predict the likelihood of an eruption and evacuation plans can be put in place, but trying to prevent an eruption is an effort in futility. Still, there are steps you can take to minimize the damage or impact.

## Planning for a Crisis

In preparing for and managing a crisis, public administrators must first have plans in place to handle whatever crisis may arise. The first step in this process is to decide what crises are likely or even possible to occur. This takes knowledge of what sorts of events have happened in the past, an understanding of current systems and what issues could arise from something going wrong and some level of creativity to imagine what sorts of crises may come about in the future.

After coming up with possible scenarios for crisis situations, administrators must plan for how to handle them. Formulating a plan of action beforehand can speed up the response time of a bureaucracy. Plans could include local officials having alternate routes for emergency vehicles during a blizzard, disaster relief teams having trailers well stocked with supplies and ready to go, or simply ensuring that someone is on call in the middle of the night. Even something as large and consequential as the Presidential order of succession is a crisis management plan for a public bureaucracy.

In making these plans, it is important to listen to those with experience and expertise in the field. It is likely that a public agency or organization will already have a fair number of people with experience on staff. In this case, an organization will probably have dealt with a similar crisis in the past, gaining valuable knowledge along the way. Administrators may know what has worked or not worked in the past. They can know what issues were present or what factors they did not consider. In this way, new plans can be made, building off of and improving upon old crisis management plans.

Once established, these plans need to be made widely known. This level of coordination can also prevent different parts of an agency from attempting to handle a crisis in different ways. In a hurricane, for example, if half of an agency tried to evacuate residents and the other half instructed residents to shelter in place, the results would be chaotic. Ensuring that everyone is on the same page can prevent mass confusion among crisis responders, which typically makes the problem worse. Crisis management plans also need to be practiced, so administrators and officials have the skills and training needed to enact them when a crisis does occur. Running emergency drills can be costly, time-consuming, and tedious, but the benefit of being prepared when something does go wrong is priceless.

Planning must also take place between different bureaucracies and agencies. When a crisis occurs, having multiple agencies ready to address the situation in unison can prevent confusion and improve response times and effectiveness. Again, different levels of government may respond to different parts of a crisis. Keeping lines of communication open and having good relationships with other officials will make the management of crises much easier.

In some situations, what separates a crisis from an everyday occurrence is simply a matter of scale. Plans for snow removal in a blizzard may not be fundamentally different than snow removal plans for a heavy dusting. The only real difference is how much snow is being removed. Shutting down a bridge for routine maintenance is not all that different than shutting it down for major structural repairs. The only difference is the

possible length of time transportation will be rerouted. In these situations, administrators and officials may have a larger problem on their hands, but they may not need to handle or prepare for it any differently than they would a run of the mill issue.

## Handling a Crisis

When a crisis does happen, public administrators must act quickly and effectively to either solve the crisis, limit its effects, or recover from it. If they don't, the public could lose trust in the agency or begin to panic. If contaminated food is being sold to the public, the FDA and USDA need to get it off the market as soon as possible, not only to stop the spread of foodborne illness but to reestablish trust in the nation's food supply. Quick action can keep a small crisis from expanding into an all-out emergency, and it is in these situations when administrators are glad they have coordinated, rehearsed responses ready to go.

In most crisis situations, a prepared plan will suffice. Again, similar crises are likely to have occurred in the past, and administrators and officials will more often than not have some experience in dealing with them. Even in the most mundane crises, however, new factors may come into play. A new housing development could change flood patterns. A leadership change in a foreign country can affect trade agreements. Despite maintenance, machinery can still break down at inconvenient times. Interest rate adjustments may not affect unemployment numbers quite as much as economists had predicted.

When unexpected factors work their way into a crisis situation, flexibility becomes a major virtue for public bureaucracy. Plans which include some level of adaptability are much more suited for success than contingency plans which are too rigid (Gilpin and Murphy 2008). Adaptability is important both when situations are slightly different than what administrators initially had in mind in the planning process and when something happens in the middle of dealing with a crisis. For many, adaptable plans are considered to be vital, as planning for every possible crisis scenario is impractical. In addition to dealing with unexpected situations, having flexibility built into crisis management plans can also open up the planning process to new ideas. When protocols and organizational structures are too rigid, people's willingness to question decisions may be limited. It is good to have workers in a bureaucracy that are focused, but not so narrowly focused that they don't see other options that are possible or other problems that may arise. This does not mean that agencies and organizations should just wing their way through a crisis, but as a general rule, crisis management plans should shift more toward adaptiveness and improvisation.

During a crisis, bureaucracies must also be willing and able to work with other organizations. The idea that individual departments or agencies are completely insular in handling a crisis is a myth. Due to the complexity of modern systems, one organization may not be able to limit the spread of a crisis, and trying to solve a problem without the support of other agencies may make the situation worse. A water main break will obviously require the local water company but will also likely require police to reroute traffic and health departments to issue boil water advisories. Administrative officials must also know how one agency's actions can affect another. Regulations put in place by state and federal Mine Safety and Health Administrations can make the job of the EPA easier or harder. The TSA and FAA affect each other's operations greatly. Open communication between agencies can help resolve a crisis faster and may even help prevent one in the first place. In doing this, however, the risk of competing agency heads becomes greater. A clear chain of command can help avoid confusion.

One of the worst things that agencies can do is panic or overreact. Bureaucracies have to be seen as doing enough to handle a situation, but must ensure that they are handling it in the right way. While it is likely the case that members of an agency have experience in dealing with crises already, a new or poorly understood situation can lead to administrators making poor decisions.

Media attention and public scrutiny can cause agencies to take large, bold actions that may not be necessary. If a police department wants to demonstrate control and establish a sense of order, it may send in entirely too many officers to quell a generally peaceful protest. Fears of terrorism can cause entire races or religions to be unfairly targeted for arrest or surveillance. Overreactions in policy choices can create crises even worse than the ones they were trying to solve. For example, overreaction in the quest to solve a crisis of drugs and violence resulted in an incredibly disproportionate level of minorities being incarcerated, which in turn has caused economic and criminal justice crises. Other policy decisions are likely to have had much more positive impacts with much fewer negative results.

And finally, public bureaucracies must be open and honest about what is going on. If information is not available, the public will speculate and start believing rumors. Agencies obviously shouldn't divulge information that could make a crisis worse, but they should be open and approachable, keeping the public informed and solidifying trust that the organization is sufficiently handling the situation.

## Crisis Monitoring

Bureaucracies typically spend a large amount of time and resources monitoring for potential crisis situation. Weather and economic forecasts are monitored closely to inform the planning process. Military intelligence can help assess risks around the world. In monitoring, however, some crises are much more difficult to spot. Immediate crises are easy enough to pinpoint. Officials can see a hurricane forming and follow its path closely. Emerging crises, on the other hand, are notoriously difficult to predict. These situations are like the proverbial frog that has been placed in a pot of slowly boiling water. Even if warning signs are noticed, the full impact may not be understood until after a crisis breaks out (Parsons 1996). Still, agencies must do their best to monitor situations, predict outcomes, and decide whether to act or wait.

## Public Trust in Bureaucracies

Bureaucracies must also concern themselves with public perception. Most agencies begin with some immediate goal in mind. Usually this goal is popular enough to have garnered enough support and funding in legislatures. Protecting the environment, educating children, and sending people to space have all been the goals of various government agencies, and most of these agencies were met with strong initial support. However, the further in the past an agency was founded, the more likely it is that people will have forgotten the support and excitement that once surrounded it.

Following a crisis, public perceptions often change. Sometimes this happens slowly, other times quickly. NASA, for example, was an organization that could do no wrong. The entire nation supported its goals and followed its progress. Over time, however, people became less excited about the organization's mission. Apollo 1 and Apollo 13 were early warning signs that things may not be perfect, and after the end of the lunar landing program, people became much less tolerant of mistakes. Two space shuttle disasters, lost probes, and expensive repairs to satellites and telescopes severely impacted public support for the administration. Other agencies can see support vanish much faster. FEMA was quickly and thoroughly ridiculed for its handling of Hurricane Katrina. Almost overnight an entire agency was vilified in the eyes of the public.

Administrators must constantly try and maintain a positive public image or at the very least avoid a negative one. A lack of public support for an agency or its mission could single that agency out for budget cuts by legislators looking to please constituents, or for reorganization by executives tasked with making that agency work more effectively or efficiently. Popular agencies on the other hand can receive a large amount of leeway in how they operate and not worry too much about funding. What makes this task difficult is that the public may not notice when things go well. People expect bridges not to collapse. They expect terrorist attacks to be prevented. But one mistake can counteract decades of success. While it is not fair

to hold public agencies to this standard of perfection, it is still the reality that many officials face.

## Administrative Budgets

While maintaining public support is vital for maintaining funding for a bureaucracy, there are other budgeting concerns that need to be considered. Budgets can be cut for a number of reasons. Lack of support is one. Another may be a simple lack of funding. Even programs that receive praise and success can still see their budget well dry up in lean economic times. Within an agency, it is important that funding be appropriated properly and effectively to ensure that valuable funds are not misspent. Being smart with funding can not only help within a budget cycle but can show legislators that appropriated funds will not be wasted.

When a crisis does occur, there will undoubtedly be funding concerns that come with it. Agencies involved directly with the crisis can see their funding increase or decrease depending on the nature of the problem. Most of the time, an administrator will attempt to work a crisis into a funding increase. Arguing that the issue arose due to a lack of staffing or outdated equipment can be effective. If the crisis was clearly the fault of an agency, it may put the agency's budget under public scrutiny. And finally, a crisis in one area can affect funding for a completely different agency. An increase in the funding level for one agency can mean a decrease in funding for another. Especially in jurisdictions with balanced budget laws, budgets can become a zero-sum game rather quickly.

## Administrative Ethics

Public bureaucracies must also deal with ethical considerations (Svedin 2011). One concern at the local level is for snow removal. Should preference be given to wealthier neighborhoods? What about areas with larger populations of elderly individuals who may be more likely to need medical care? For education planning, how is it decided which children are enrolled in better public schools? In health policy, can agencies force someone to vaccinate their children? What are the legal and ethical considerations for quarantining someone? How much surveillance can the government use to protect us before a line is crossed? These ethical decisions are made every day in bureaucracies and affect the lives of people everywhere.

Further complicating ethical considerations, public bureaucracies often set a value for human life. For instance, agencies such as the EPA, the FDA, and the Consumer Product Safety Commission have placed values on human life. If the cost of regulation exceeds those amounts for each life potentially saved, the regulation may not occur. These cost-benefit analyses can be unsettling and create serious ethical implications for government bureaucracies.

Citizens want to know that their government and its agencies have acted ethically and done the right thing. Success is great, but if that success crosses ethical boundaries, the public outcry can be fierce.

## Conclusions

No one wants a crisis to occur, but crises do present public agencies with enormous opportunities to learn and adapt. Fortunately, bureaucracies can learn from the mistakes or misfortunes of others. There have been enough crises that various agencies have had to manage that there are plenty of lessons to be learned. Riddell (2012) offers several such lessons. He states that agencies must be vigilant and prepared before a crisis hits and react quickly and openly when it does. He also suggests respecting local knowledge for handling a situation more effectively. While we can never prevent all crises, bureaucracies can learn enough to help limit their effects on communities.

# Public Choice Theory of Organizations

Kevin W. Davis
The School of Graduate and Professional Studies, Delaware Valley University, Doylestown, PA, USA

## Synonyms

Choice theory; Neoliberalism; New public management

## Definition

Public choice theory is an economic theory that argues for public decision-making and the production and allocation of public goods and services to be based on citizens' preferences.

## Introduction

The theoretical concept of public choice theory (PCT) argues that government services are best organized by consumer-citizens' preferences. This perception of choice is characterized by Tiebout's (1956) consumer-voter theory that argues citizens shop around for communities that best fit their preferences and neoliberalism that argue governments are monopolies, which will inflate the cost of public goods and services. These two perspectives have shaped the PCT discourse that argues for market principles in the production and allocation of pubic goods and services. Public choice theory is a neoliberal theory which emphasizes the private sector in the deliverance of public goods and services and views citizen as consumers (consumer-citizens). PCT was introduced into the public sector lexicon in the mid-twentieth century (Buchanan 1984) and was predicted to provide insight into political decision-making (Mueller 1984) and policy recommendations (Quiggin 1987) and create a new perception of public administration (Ostrom and Ostrom 1971). The theory has become the antithesis of Keynesian theory and a challenge to the successful implementation of New Deal policies (Dearlove 1989). Keynesian theory argues for a strong government presence in the economy, especially during continued negative economic growth (recession).

PCT is defined as the attempt to understand decision-making in noncompetitive markets (Mueller 1984) and as the "economics of politics" (Dearlove 1989). The theory is derived from neoclassical economic theory where government was expected to take a "laissez-faire" approach to the economy (Buchanan 1984; Ostrom 1975; Quiggin 1987). Ostrom (1975) depicts PCT as a public/private consumption of goods dichotomy. The underlying issues of this dichotomy are non-subtractability, exclusion, and jointness of use (Ostrom 1975), which are the base determinates of public and private goods.

### Exclusion

This condition excludes other customers the use of a good or service (i.e., private vehicle). This condition establishes a private good.

### Non-subtractablility

This condition precludes that there is an inability to prevent someone from benefitting from a good or service while not paying for it (i.e., clean air); this condition establishes a public good.

### Jointness of Use

This condition allows multiple users at the same time as long as they are willing to pay for the good or service (i.e., toll roads). This condition is a hybrid between public and private consumption.

## PCT Discourse

According to Dearlove (1989), there are three main assumptions of PCT. First is the rejection of the idea of the social compact or contract; second is the belief that all individuals are maximizers (self-serving); and third, individuals' economic behavior is rational. The idea of the social compact is that individuals enter into mutual agreements that are the key to forming societies and the nexus of government. Individuals exchange some personal freedoms for mutual existence and protection (McLaughlin 1900). PCT argues that the social compact does not exist. It asserts that in private or public, the individual is a utility maximizer. What motives the individual is to gain the greatest benefit for him or herself irrespective of others. To be a utility maximizer requires the individual to have knowledge of all of the alternative choices. Ostrom and Ostrom (1971) contend in order to evaluate the alternatives, the individual must be able to analyze "certainty, risk, and uncertainty" in his or her decision-making (p. 205).

What makes PCT necessary for public organizations is the argument that political actors are also utility maximizers; that is to say that political decision-making is based on the theory that all public officials act in their own self-interest. PCT is not a new theory to explain political actors' behavior but rather overlays economic theory onto the public sector, arguing that the same motivating factors that affect "economic man" are the same factors affecting "political man" (Dearlove 1989).

Market theory emphasizes that in a prefect market, an individual's economic behavior can be predicted because of self-interest. Overlaying PCT onto the political structures identifies political decision-making as the same as economic decision-making. From the advantaged point of political maximizer, political failure is caused by self-interested political actors. PCT supporters maintain that the market is best suited through consumers' choice to provide a more efficient delivery of public goods and services, because it keeps in check the self-interest of the political actor. Organizing through consumer choice allows public agencies to provide goods and services that consumer-citizens want and are willing to pay for (through taxes).

The view that all political decision-making is based on utility maximization is considered an oversimplification of political action (Mueller 1976). Quiggin argues that the application of PCT by economists was developed to predict decision-making, but fails to consider other variables besides self-maximization that may affect political decision-making such as political actors' values, beliefs, and ideology. The utility maximizer principle makes the individual the unit of analysis for government decision-making (Ostrom 1975). This perspective gives no consideration to group action such as advocacy coalition that is instrumental in policy formation and implementation. PCT offers a jaded view of politics, government, and bureaucracies that reflects the self-interest of policy-makers. Not all advocates of PCT see the theory's self-interest premise as negative, but rather as an innate perspective or preference of the policy-maker (Ostrom and Ostrom 1971). Ostrom and Ostrom argued that self-interest should not be equated with selfishness.

The premise of PCT is based on the assumption of rationality and the ability to make prediction about behavior. Rationality allows for the ordering of known alternatives (Ostrom and Ostrom 1971). In order to make an informed decision, the decision-maker has to compare all of the options available and understand the consequences of his or her actions or inaction. Without this assumption, prediction would not be possible. The use of the predictive model is designed to equate PCT to the natural sciences (Dearlove 1989). Quiggin suggests that economist use PCT because it fits into the economic theory.

The understanding of choice and competition is central to neoliberal ideology of government

and advocacy for PCT. In theory, choice represents freedom and liberty, the curtailing state power over individuals' lives. The exercise of state powers is believed to infringe upon the rights of the individual. The power of the state is measured in its ability to levy tax and to regulate. In neoliberal discourse of freedom, freedom is defined in terms of economic freedom, the curtailing of state authority over individuals' choices.

PCT proposed that government is too big and privatization of governmental goods and services will shrink the size of government (Kettl 1993). The bigger the government the more taxes are required, which limits economic freedom. The argument for privatization is presented in public discourse as an issue of choice for the consumer-citizen. Public choice theorists argue that government is ineffective and unresponsive to the needs of its citizens. They contend that because government holds a monopoly on services, there is no incentive to become effective, efficient, or responsive. Government has no incentive to change because there is no mechanism (competition) to induce accountability and responsiveness.

Neoliberal thought as expressed in PCT has been made applicable to public sector management through privatization, contracting, and new public management. PCT is highly invested in free market theory especially as it relates to freedom and choice. The market is also argued to be rational, but the rationale for public goods is tantamount to social construct (Lauen 2007). Social constructs are not rational, but are based on values, norms, and beliefs. In essence, PCT is an attempt to apply rational theory to irrational behavior. In order to have choice, there must exist a selection of providers in which to choose. When government is the only provider then there is no choice and by default no freedom.

Public choice theorists propose that the inefficiencies that occur in government are akin to the inefficiencies in monopolies. Monopolies are formed when one dominant producer controls a significant amount of market shares within an industry limiting competition. In monopolies where there is little or no competition, the price of the goods or services will continue to increase (Sweetland 2002).

## PCT Application

Key to providing public goods and services is effectiveness and efficiency. Public administration (PA) theory argue that effectiveness and efficiency are two pillars of PA (Frederickson 1990; Rice 2004; Svara and Brunet 2004). In theory PCT is an attempt to address these two issues. A simplistic definition of effectiveness is defined as how well governmental agencies meet consumer-citizens' preferences. There are two essential concept used to make the argument for the necessity of public choice application within public organizations. First, consumer-citizens seek communities to satisfy their preferences (voting with your feet) and, second, the failure of government to meet the needs of consumer-citizens.

### Voting with Your Feet

Consumer-citizens choose to relocate to areas that meet their preferences (i.e., extensive public park system, good public schools, entertainment venues). The concept of voting with your feet was derived from Tiebout's theory of the preference of the consumer-voter. To ideally conceptualize this concept, one has to assume that the consumer-citizen has the ability to be mobile (Tiebout 1956). Within this concept there are no barriers which could hinder consumer-citizens from moving in and out of communities to satisfy their preferences. Additionally, one has to assume that consumer-citizens have the ability to rationalize their decision-making. That is to say, consumer-citizens understand the consequences of their choices.

### Government as Monopoly

In shaping the discourse to support PCT, a contrast was drawn between the public and private sectors. In this analogy, government is portrayed as the inefficient bureaucratic monopoly. Efficiency in economic terms is achieved in two ways: by maximizing each dollar spent and by producing goods and services at the lowest unit cost (Skogan 1976). Comparing government agencies to monopolies implies that efficiency cannot be achieved in the current government

organizational structure. Because political actors are acting in their own self-interest, they will not seek efficiency. It is by the introduction of market principles (competition) can efficiency be induced into public organizations.

### Organizing Government Services Through Public Choice

In order for PCT to work, government agencies need to develop ways to capture consumer-citizen preferences. This is accomplished through citizen surveys, focus groups, and performance measurements. Through citizen surveys and focus groups, government can measure consumer-citizen satisfaction with government services and assess how consumer-citizens believe agencies can improve and become more effective. Effectiveness is interrelated to consumer-citizen satisfaction. From the perspective of the consumer-citizen, how well does the agency meet the aggregate preferences? That is to say, does the agency provide what the consumer-citizen wants? Additionally, effectiveness also encompasses the level of effectiveness. For example, consumer-citizen X relocates to community Y because of its public parks, but the restriction of the use of the parks (time the parks are open) may have an effect on consumer-citizen X's level of satisfaction.

Tiebout's consumer-voter theory suggests that communities provide an array of differences, different levels of services, and selections. In essence communities are in competition to attract certain types of people to relocate. Ascertaining why individuals relocated allows the government to focus their resources to meet those needs. Because individuals have identified their aggregate preferences, government spending should reflect those preferences. Preferences identified by consumer-citizens will have community support and are more likely to support their preferences through taxes. This type of public organization of goods and services is more preferable because it directly organizes public goods and services to the preferences of consumer-citizens, showing government responsiveness to the needs of consumer-citizens, and increases the effectiveness of government. A drawback is that as individuals move in, others will be deciding to leave. The net gain or loss of population can have an adverse effect on governmental finances. Too many can move in, exceeding the optimal population, or too many may leave, shrinking the tax base.

Figuring out what consumer-citizens want and meeting those needs addresses the effectiveness of government, but not efficiency of government. To achieve efficiency, PCT argues for the separation of the provision of public goods and services from government. The inference of political man is that he is the same as economic man. This suggests that the production of public goods and services is the same as the production of private goods and services. Efficiency is only achievable in government when competition is allowed.

PCT argues that most public goods and services can be carried-out through the awarding of contract in a competitive bidding process. The competitive nature of the bidding process is designed to seek the true cost thereby reducing inefficiency.

## Conclusion

As there has been a continued push to implement PCT principles in public organizations that grant the private sector more access to provide public goods and services, the inroads of PCT have come at a price to public agencies. Critics argue that the application of PCT erodes the democratic process, ignores issues of social equity, and has a negative effect on public employees' morale.

PCT argues that public agencies are unresponsive to the needs of its citizens, suggesting that the policies and programs are an expression of bureaucrats' self-interest. And because there is no mechanism to induce competition, government agencies are said not only to be ineffective but inefficient as well. The ineffectiveness and inefficiency of public organizations are akin to private sector monopolies. PCT want to use competition to break up the monopolistic hold that public organizations have on the production and allocation of public goods and services. From the market perspective, PCT delivers what the

consumer-citizen wants. But this may create inequality and inequity in the delivery of government goods and services. Inequality and inequity is acceptable because market principles allow for exclusions. In a pure market, this is acceptable; the market does not just provide what the consumer wants, but what he or she is willing to pay for. In this instant, government cannot operate like the market. In a democratic society, government cannot normally exclude individuals from full participation in society. If government provides a good or service, it must establish equal access for all. Organizing public agencies through PCT can negate the government's responsibility to social equity. Public bureaucratic agencies organized through public choice seeking to meet the needs of the majority may not address the needs of the minority, especially in vulnerable populations. For example, if a public park charged a user fee for its community swimming pool, the fee may be restrictive and exclusive to some residents because of their inability to pay.

As PCT was argued to be a better way to meet citizens' needs, it often was accompanied with antigovernment agency rhetoric that has an adverse effect on government employee's morale and effectiveness. Aberbach and Rockman (2000) argued that the constant reframing of the ineffectiveness of government and its employees has an effect on employees' morale and increases the likelihood of ineffective service.

The use of privatization and contracting has the potential to cause other issues of governance that affect the democratic process and political control over public goods. The contractor is not an elected or appointed official of government and may not be subjected to political controls. The relationship between government and the contractor is governed by stipulations in the contract, which creates a principal agent relationship. Providing pubic goods and services through contracts is not new, but has always occurred in government. If it is assumed that the individuals are utility maximizers, then it should be assumed that the agent will work in his or her own self-interest instead of the principal's interest. Within this perspective, the government must maintain expertise within the organization in order to evaluate the contract and monitor the contractor's ability to meet the obligations of the contract.

# Public Contracts

Geo Quinot
Stellenbosch University, Stellenbosch, South Africa

## Synonyms

Administrative contracts; Government contracts; Public law contracts; Public procurement; State contracts

## Definition

A contract is a legally enforceable voluntary agreement entered into by two parties with the intention of creating rights and duties, i.e., obligations. A public contract is a binding agreement concluded between an entity that forms part of the state and a private contractor in terms of which a public function is facilitated.

## Introduction

Public administration participates in the marketplace in ways that are very similar to other private commercial actors (e.g., consumers or companies). For example, administrations acquire and dispose of goods and services, enter into financial arrangements, and conclude partnerships. In all these transactions, the administration utilizes the primary legal mechanism to create commercial relationships, namely, the contract. However, although public administration may appear equivalent to any other (powerful) market participant when engaging in these transactions and their contracts seem to be equivalent to any other commercial contract, these arrangements involving public administration remain distinct from "normal" commercial transactions (Quinot 2008). Due to its unique status and position in any given society, public administration is never wholly equivalent to other (private) legal actors with the result that its legal relationships are also distinct. In recognition of this distinctiveness of the administration's commercial dealings, the notion of a public contract has developed in many legal systems.

The label "public contract" may simply be something that is given to any ordinary contract to which a public entity is a party. On the other end of the spectrum, a "public contract" may constitute a separate and distinct legal concept from the ordinary contract. Legal systems generally vary between these two extremes in their treatment of public contracts (Turpin 1999; Mitchell 1954). Nevertheless, the basic characteristic of the notion of a public contract is that it recognizes the broader public interest in the commercial arrangement created and governed by the contract. In this sense the notion of a public contract is thus as much an instrument of public administration as it is an instrument of commercial transaction.

## Identifying Public Contracts

Due to the vastly different ways in which different legal systems recognize and regulate contracts concluded by public administration, it is not feasible to define a public contract in any precise manner. It follows that it is not always easy to identify a public contract or to distinguish it from an ordinary commercial contract.

In some systems certain types of arrangements that public administration may enter into are simply defined as public contracts in legislation and conversely also those arrangements that are not recognized as public contracts, but that remain purely private or commercial contracts despite public administration's involvement. France provides the stereotypical example of such statutory division between a distinct concept of a public contract, the *contrat administratif*, and ordinary commercial contracts, *contrats de droit commun* or *contrats de droit privé*, both of which may be concluded by public administration (Turpin 1999; Maree 2013). In France, legislation simply dictates that contracts entered into by the public administrator for the sale of immovable state property, for example, are *contrats administratif*.

It is far more common, however, to find that public contracts can only be identified by means

of a range of criteria in a given context. These criteria typically serve to distinguish the public contract from the ordinary commercial contract. Criteria typically used for this purpose vary from very general ones such as public function or public interest to more specific ones such as the identity of the contracting parties, the power relationship between the contracting parties, the source of the power used to conclude the contract, the nature of the contractual clauses, or the source of the funds (or other resources) used under the contract. General criteria such as public function or public interest are notoriously difficult to define with any precision with the result that these criteria are highly malleable and thus open to vastly different interpretations and outcomes when applied in a given scenario.

On the one hand, one may argue that all activities of the public administrator, including all contracts concluded, must have a public-function basis and be in the public interest. In this view one could question whether any conduct by the public administrator that is not aimed at fulfilling a public function and serving the public interest would be legitimate. These two criteria may constitute the very justification for having public administration. If this approach is taken, all contracts concluded by the public administrator will necessarily have to be defined as public contracts. The true criterion in identifying the public contract is accordingly the identity of the contracting party, the public administrator, and not the public function or interest. However, public interest or public function can still play an important role where the party concluding the contract is nominally not part of public administration, but is in fact fulfilling a function on behalf of the public administrator or fulfilling a function that the public administrator would otherwise have had to fulfil had it not been for the private party's actions.

On the other hand, one may argue that some contracts concluded by the public administrator are so remote from any direct public function that they cannot be said to constitute public contracts. The argument in this approach would state that the contract itself does not constitute a public function and that the public interest in that contract is accordingly very low regardless of the fact that the public administrator may at some level be engaged in delivering a public function in which the public has an interest. These contracts should accordingly be recognized as normal commercial contracts despite the presence of the public administrator as a party.

The difference between these two approaches to identifying public contracts is one of degree rather than conceptual. It should be evident that one could always make the former argument, but that the link to an identifiable public function pursued via the contract by the public administration may become so tenuous that one may question whether the contract itself should be recognized as a public contract.

More specific criteria may avoid these difficulties experienced with general criteria, but they, in turn, may run the risk of being over- or under-inclusive as is the case with all specific rules. Focusing only on the identity of the contracting parties may be under-inclusive since it may exclude contracts concluded by private parties on behalf of the public administration. Focusing only on the use of public funds may again be over-inclusive as it may lead to contracts concluded by private parties using funding under a state grant or subsidy being recognized as public contracts.

In the absence of the clear identification in a legal prescript of a particular (type of) contract as a public contract, a combination of criteria will have to be used to consistently distinguish between those contracts of the public administrator that constitute public contracts and those that amount to ordinary commercial contracts.

A final factor to consider in identifying public contracts is that the parties to the arrangement must be separate legal persons, that is, entities that are recognized as having separate legal existence. For the most part, this would imply that one of the parties must be a private person (individual or firm). Arrangements where *both* parties are entities within public administration (e.g., different departments or agencies) cannot generally be considered public contracts. The reason for this factor is that a contract is understood as an agreement between *two* legal persons. Where the parties form part of the same legal entity (public administration), this element is absent. However, agreements between two public bodies that are clearly distinct legal entities may qualify as public

contracts. For example, in a federal state, it may be possible that arrangements between the central (federal) public administration and a local administration qualify as public contracts, because the two administrations have separate and distinct legal personality, i.e., they do not form a single public administration.

## Purpose of Public Contracts

While public contracts share many characteristics with ordinary commercial contracts, they are distinct for at least the reason that they *also* serve as instruments of public administration. It is the purpose of public contracts that sets them truly apart from other forms of contracts.

The purpose of public contracts can usefully be understood within the dichotomous categorization of the (legal) forms available to the public administrator to implement policy, namely, *imperium* and *dominium* (Davies 2008; Daintith 1979). *Imperium* refers to the state's use of its sovereign power to effect policy, typically through primary legislation passed by a legislature or subordinate legislation (regulations/rules) issued by administrations. *Dominium* on the other hand involves the use of state resources (wealth) to implement policy. In this second form, the public contract plays a leading role as the primary vehicle to achieve policy implementation.

The purpose of the public contract is thus always tied to the realization of policy in the public interest. This is an important feature of public contracts. It implies that while the contract may have a direct and basic exchange purpose between the particular parties to the agreement (goods/services in exchange for payment/consideration), the public contract *also* serves a broader public purpose by facilitating the public interest. It further follows that a much broader category of persons have an interest in the public contract compared to the notion of privity of contract that applies to ordinary commercial contracts and that holds that it is only the immediate parties to the relevant contract that have an interest in that contract to the exclusion of all others.

## Rationale for Using Public Contracts

There are a number of reasons why the public administrator would use a contract as the vehicle to achieve a public purpose as opposed to the more traditional *imperium* forms of administration.

Since the contract is inherently a consensual or at least highly participatory form of interaction, the use of public contracts may result in much higher levels of cooperation and buy-in from those subject to the relevant administrative scheme than in cases where the state uses its command-based techniques of public administration. With the use of a public contract, the private person becomes an active party to state administration rather than simply a subject.

Public administration may also turn to public contracts in an attempt to achieve the efficiency that is traditionally associated with the private market. A hallmark of a well-functioning market economy is that goods and services are exchanged in an efficient manner. The public administrator may want to either harness that market efficiency in the pursuit of its public functions or may want to emulate market efficiency in its administrative functions. By acquiring goods and services in the private market by means of public contracts rather than attempting to produce or provide itself, the administrator can tap into the existing efficiency of the market. In this manner public contracts utilize market power in furtherance of public functions. The public administrator may also want to reproduce market efficiency by couching a public function in a market-based form by means of a public contract. In terms of such a strategy, the administrative functions are framed in market form with the objective of generating efficiency in the administrative functions akin to that of the private market.

The turn to public contracts may simply be aimed at involving powerful or resource-rich private entities in public administration. Most (if not all) public administrators lack the necessary resources to fulfil all public functions or serve all public interests optimally at all times. It has accordingly become common for public administrations to collaborate with private entities in public programs. The public contract is the primary

vehicle in terms of which such collaboration is structured.

There are also some less positive reasons for the use of public contracts in public administration. One may be that contracting may involve less public oversight than other forms of public administration, especially the more traditional command-based techniques. The public administrator may thus have more freedom in utilizing public contracts compared to the use of regulations or pursuing a public function by means of legislation that needs to pass through the legislature. In many legal systems, the control of the courts over contractual actions of the public administrator is far less than the courts' control over action taken in terms of legislation. The sharp rise of public procurement regulation in recent years globally has, however, restricted the freedom of public administrators in the use of public contracts.

## Peculiar Rules

The involvement of the public administrator in public contracts and the distinct purpose served by public contracts result in a number of distinct and peculiar rules applied to this form of contract compared to ordinary commercial contracts. The precise rules and the extent to which these rules differ from ordinary contract law vary between legal systems. Rules governing public contracts are most distinct in systems where a distinct concept of a public contract is recognized, often also governed by courts other than those governing ordinary commercial contracts. However, even in legal systems that do not recognize a separate concept of a public contract, there are still rules applicable to public contracts that do not apply to ordinary commercial contracts.

Peculiar legal rules governing a distinctive public contract, typically found in legal systems influenced by French law, for example, explicitly recognize the inherent inequality of the parties to the contract, the broader public interest being served by the contract, and the responsibilities of the parties to the contract to stakeholders beyond themselves (Turpin 1999). One thus typically finds rules in these systems that allow for public administration to make unilateral adjustments to the contract in the public interest but also for the subsequent protection of the private party to the contract in maintaining the economic balance within the contract.

In systems where no distinct concept of a public contract is recognized, typically systems influenced by English law, the relationship under a public contract may still be subject to peculiar rules by means of the application of administrative-law rules on top of ordinary contract-law rules. A good example is the administrative-law rule against the fettering of administrative discretion that would equally apply to public contracts. This may mean that a particular term of a contract may become unenforceable under particular circumstances if such enforcement would result in the undue fettering of the public administrator's discretion to act in the public interest under those circumstances (Davies 2008; Mitchell 1954).

## Conclusion

Public administrators, especially (but not exclusively) in capitalist economies, make extensive use of contracts as a vehicle to fulfil public functions and to serve the public interest. Whether these contracts should be viewed as distinct from the contracts concluded by other market participants in the given country depends largely on the legal system of that country. In particular, it depends on whether a distinct concept of a public contract has developed within the relevant jurisdiction. However, even in those systems where no distinct legal concept of a public contract has emerged, it is clear that contracts concluded by the public administration are different from ordinary commercial contracts. This difference may simply flow from the fact that one party to the agreement is the public administrator that is subjected to different legal treatment and that pursues different purposes than private market players.

With the line between public and private functions and between public administration and private enterprises continuously shifting and seemingly blurring, it is to be expected that the

notion of the public contract will grow in significance as a tool of public administration.

# Public Control as a Mechanism of the Openness of Public Procurement: Case of Russia

Nadezhda Sirotkina and Svetlana Pavlovskaya
Public Administration Department, Faculty of Management, National Research University Higher School of Economics, Nizhny Novgorod, Russian Federation

## Synonyms

Government contracting out; Outsourcing; Outsourcing anti-fraud measures; Public control; Public procurement in Russia; Public procurement regulations in Russia; Transparency of public procurement

## Definition

Public procurement is the process by which public authorities, such as government departments or local authorities, purchase work, goods, and services from the private sector.

## Introduction

Public procurement is a source of high corruption risk due to the large amount of funds involved and specific procedures for using such funds. Wide powers of governmental and municipal authorities who are responsible for the contracting also contribute to corruption vulnerability of the public procurement system. The corruption damage in public procurement is very significant. As estimated by the Organization for Economic Cooperation and Development (OECD), the losses due to corruption range from 20 to 25 percent of the procurement budget, that is, around 2 billion USD annually. According to experts, the losses of the Russian budget resulting from corruption range from 5 to 7 billion dollars.

One of the high-profile cases related to unfair public procurement in Russia was the acquisition of CT and NMR scanners for regional healthcare facilities. The equipment was purchased at the price of 95 million roubles per unit, while the market price was in the range from 28 to 40 million roubles. The total of 64 scanners were purchased at elevated prices. The damage to the budget amounted to 700 million roubles.

Public procurement nourishes corruption due to the specificity and the large number of participants who are prone to corrupt activities. A large number of acts of corruption are possible in public procurement. Different forms of corruption have been observed in public procurement: bid rigging, bid orchestration, and distortion of quality ranking (Dimitri et al. 2006). Russian practice often draws a line between fraud and corruption. The term "corruption" refers to actions which involve contract performers and officials who make decisions on contract awarding. Corrupt practices include slanted specification, breach of confidentiality, lax contract administration, and conflict of interests.

The term "fraud" is used to describe the opportunistic behavior of the bidders, which manifests itself in the form of collusion, holding prices at a certain level, provision of false certificates, and over-invoicing, as well as other noncompetitive activities.

The variety of corruption opportunities depends on the complexity of the procurement as well as the stage of the procurement cycle. The types and incidence of corruption phenomena are determined by a number of other factors, such as national legislation regulating the complexity of tendering procedures, the extent of electronic filing format use, and rigidity of state control.

The variety of forms of corrupt practices requires the establishment of corruption elimination mechanisms, or at least reduction. In addition to the financial losses associated with the conclusion of contracts on conditions that are unfavorable for the state, fraud and corruption in public procurement contribute to the deterioration of the investment climate and lead to reduced confidence in the government.

In a situation where corruption manifestations are diverse and multifaceted, one of the most effective and versatile tools to combat corruption is public control.

Public control technologies are widely used in world practice. One of the OECD guidelines in the area of public procurement is the Principles for Integrity in Public Procurement, according to which "...governments should consider involving representatives from civil society organizations and the wider public in monitoring high-value or complex procurements that entail significant risks of mismanagement and corruption."

Individuals, trade associations, professional associations, and business firms need to be involved into public control activities. In the USA, Transparency International has developed Procurement Monitoring Guide as well as online Procurement Monitoring Tool for civil society organizations in order to monitor the public procurement. In Mexico, social control functions are performed by "Social Witness" civil society groups, which take part in the contracting process and work on the basis of an agreement between the state and the procurement agency (Transparency International 2014).

The fight against corruption is the driving force behind reforming the public procurement system in Russia. Therefore, much attention is given in the legislation to improving the transparency of procurement procedures. Such measures also include the organization of public control. Public control allows to detect violations of the law and report on such violations to the supervisory bodies. This very social control is called a "true Fourth Estate."

In this regard, it seems relevant to develop social control in Russia as one of the mechanisms for better public procurement transparency.

## Public Control in Public Procurement in Russia

Russia's transition from centralized and planned supplies and procurement of enterprises to their full independence in the 1990s was very sharp and extremely painful for the domestic economy. However, during this very period, preconditions for the functioning of the public procurement market started to appear. It is a characteristic that one of the first documents targeted at formation of a competitive public procurement market, adopted in 1997, contains anti-corruption rhetoric in its title. This document is the Presidential Decree "About urgent measures to eliminate corruption and budget cuts in the organization of the procurement of products for state needs" (Decree 305 dated April 8, 1997). It stipulates that the government affects state purchases on a competitive basis. Transparency in public procurement was facilitated by the adoption of Federal Law No. 94 "On State and Municipal Procurement of Goods, Works and Services" dated July 21, 2005. The law required customers to disclose information about procurement and tender procedure results in the Internet. This law created conditions for competitiveness improvement and fight against corruption. At the same time, the law only provided for limited state control, and it lacked public oversight system.

The fundamental reform of the public procurement system in Russia began in 2014 when Federal Law 44-FZ "About contract system in the procurement of goods, works and services for state and municipal needs" dated May 4, 2013 came into force (hereinafter Federal Law 44-FZ). The specific features that distinguish Federal Law 44-FZ from previous legislation are:

1. *Focus on entire procurement cycle regulation, including planning and monitoring of procurement procedures.*

The law provides for two types of procurement planning: for triennium (procurement plans) and for 1 year (procurement schedules). Public procurement based on planning allows customers to solve a range of issues: to increase procurement validity and timeliness and to organize subsequent control over budget funds. The procurement cycle is finalized by procurement monitoring, when procurement target achievement indicators, as well as procurement validity, are assessed. Starting from 2017, the legislation imposes specific procurement ID codes to be indicated in all documents related to the purchase. This code is "crosscutting," and it enables tracking of the whole procurement cycle from its planning to execution of the contract. Thus, it significantly increases the transparency of the procurement process.

2. *Establishing a unified information system.*

The unified information system is an open unified database which can be accessed at www.zakupki.gov.ru. The system provides access to a wide range of information, including procurement notices and information on procurement results, procurement plans and schedules, and information about signed and executed contracts. It also facilitates competitive procedures in real time. It is important to note that the information and the documents to be placed in the unified information system are in most cases verified for legislation compliance by the use of technology tools, thus preventing customers from placing false data. Starting from January 1, 2017, the unified information system will monitor a wider range of procurement data, including information on the amount of financial securities in plans and procurement schedules, information on procurement notices, supplier selection records, etc.

3. *Expansion of supervisory bodies system, as well as adoption of special regulations governing public control.*

Federal Law 44-FZ has considerably expanded the system of supervisory bodies. The control powers of the Federal Treasury, regional and municipal financial authorities, state budget fund management bodies, and internal state (or municipal) financial control bodies were set out. For the first time ever, public control mechanisms were enshrined for citizens, public organizations, and associations of legal entities.

The law contains a wide range of contract award methods. The following procurement procedures may be used according to the legislation:

1. Competitive procurement procedures:
   - Auction (e-auction, closed auction) – a procedure which is carried out at an electronic platform according to the lowest price criterion.
   - Request for quotations – a procedure assuming purchase by the lowest price criterion if the contract price does not exceed 500 thousand roubles. The total number of quotation requests in terms of value cannot exceed 10% of the customer procurement budget.
   - Request for proposals – a procedure involving multicriteria evaluation of proposals. It is held in a limited number of cases, for example, after contract termination or after a failed procurement procedure.
   - Tender (open tender, restricted tender, two-stage tender, closed tender, closed restricted tender, closed two-stage tender) – a procedure involving multicriteria evaluation of proposals. The tender is carried out in all cases where the law does not require other procurement procedures from the customer.

2. Single-source procurement – it is used in small volume contracting (up to 100 thousand roubles, while the total amount of purchases in terms of value cannot exceed 5% of the customer's purchasing budget/or 2 million roubles), in contracts with natural monopolies companies, in contracts where the supplier (contractor) is determined by the decisions of the president of Russia or the prime minister, etc.

Given the need to address anti-corruption tasks, the legislation is focused on the procurement procedures that eliminate customer's subjective decision-making. An electronic auction based on the lowest price criterion is the most competitive and transparent procedure under the Russian law. As a result, the electronic auction procedure has become dominant in the public procurement system in Russia. According to the results of 2015, auction notices amounted to 56.6% of the total notices on the official notification website (Report on Federal law 44-FZ application results monitoring). The distribution of procurement procedures by procurement methods is shown in Fig. 1.

In accordance with the legislation, Russian public control of public procurement can be affected by citizens, public organizations, and associations of legal entities.

The powers of public organizations and associations of legal entities comprise of:

- Preparation legislation improvement proposals regarding the contract system laws
- Requests to the customers regarding information on procurement and execution of contracts
- Independent monitoring of procurement and its efficiency assessment
- Appeal to the control authorities with an application for verification of customers' operations
- Appeal to the law enforcement agencies and the courts

Despite the fact that the citizens are referred to as persons exercising control in the legislation, the law does not stipulate the mechanisms for its implementation. The citizens can exercise their right of appeal to the state bodies and to obtain information on state bodies' activities, but the

**Public Control as a Mechanism of the Openness of Public Procurement: Case of Russia, Fig. 1** Distribution of the procurement procedures by procurement methods in 2015

P

time limit for consideration of an appeal (within 30 days) limits promptness of violation prevention in procurement.

It needs to be mentioned that public organizations actively exercise their right to appeal. This is supported by the public register of complaints in the unified information system. A significant portion of complaints comes from representatives of public organizations, and it indicates the development of social control mechanisms.

The most frequent cause of complaints from public organizations is purchasing of goods with excessive consumer properties or luxury goods, as well as association of different kinds of goods and works in one lot, which adversely affects the level of competition and reduces the scope for small- and medium-sized businesses participating in bidding.

An example of procurement public control implementation is the project of All-Russian People's Front's public organization "for fair procurement." The project is based on zachestnyezakupki.onf.ru website, and it is a service that allows to find a purchase which contravenes the law or which is meaningless. The service enables complaint submission in order to bring to work lawyers and experts. The project has brought together more than 5000 activists involved in fight against corruption and inefficient use of budget funds in public procurement. As a result, procurement for the total of 227 billion was cancelled, or irregularities were rectified. One of the most high-profile cases of appeal against actions of procurement officials in the Nizhny Novgorod region was a complaint about the open competition for construction activities ("Reconstruction of Yuzhny Avenue to the Nizhny Novgorod airport") at the end of 2015. After an unscheduled inspection of the Federal Antimonopoly Service (FAS) of the Russian Federation, a number of customer's operations violations were revealed, and the competition was canceled.

Here the risk of control misuse needs to be mentioned. Public control activists may represent the interests of certain suppliers, and it negatively affects the control objectivity. The researchers estimate that 27% of public control members are affiliated (according to a questioning survey) (Dzhuzhoma and Pogorelko 2015). That is why the professional community discusses the creation of a public control council over public procurement. Such a council will be endowed with specific powers enabling bringing council members into the fold of customer's tendering commissions.

An important mechanism of public control is the procedure of mandatory procurement public discussion.

Mandatory public discussion is a procedure that allows the public to monitor the actions of state customers from the standpoint of public procurement legislation compliance. Mandatory public discussion of the procurement is carried out if the estimated contract price exceeds 1 billion roubles.

Mandatory public discussion is not carried out in the planning and procurement if:

- Closed methods of supplier choice are used.
- Weapons, military, and special equipment are procured in the framework of a state defense order.
- A single-source procurement is used.

The unified information system website has a dedicated section for mandatory procurement public discussion. This section can be accessed by anyone, and any registered user can post comments and suggestions. Any legal entities or individuals, entrepreneurs, state authorities, and local authorities may participate in the discussion on equal footing.

Mandatory public discussion procedure consists of two stages. At the first stage, the procurement is discussed on the unified information system website and in the framework of full-time public hearings at the stage of planning. The first stage begins after placement of the schedule in the unified information system, and it suggests two ways of interaction with stakeholders. At the beginning, public discussion participants submit their comments and suggestions to the customer within not less than 20 days from the date of posting in the unified information system. The customer is obliged to respond to such comments or suggestions. Then the customer is obliged to carry out full-time public hearings to discuss the purchase. Full-time public hearings are open, and the information regarding the date, place, and time of such hearings is posted in the

unified information system. In addition, this information is sent by e-mail to public discussion participants who took part in the procurement discussion.

According to the results of the first stage, one of the following decisions needs to be taken: cancellation of the purchase, continued preparations for the purchase disregarding the results of the mandatory public discussion, and continued preparations for the purchase taking into account the results of the mandatory public discussion (including amendment of procurement schedule). The first stage results of the mandatory public discussion are recorded in the minutes, which contain information on all submitted comments, suggestions, and answers, as well as the decision taken by the customer. The minutes are posted in the unified information system within 2 days after the full-time public hearings. In case of a delay, it is automatically recorded in the unified information system by program features.

At the second stage of the discussion, the information included in the procurement notice, as well as procurement documentation, are reviewed in the unified information system. The second stage begins when such information is submitted and posted. The result of the second stage may be a decision on the continuation of the purchase without amending the procurement notice and documentation, a decision to continue the procurement with notice and documentation modification, as well as cancellation of supplier definition.

After the end of the second stage, the customer posts the second stage public discussion protocol in the unified information system. These minutes contain all received comments, suggestions, and answers, as well as the customer's decision.

After posting in the unified information system, the minutes of both mandatory public discussion phases are automatically sent to the federal executive body exercising functions of finance and budget control and supervision.

The procedure for mandatory public discussion of procurement is presented in Table 1.

Starting from July 1, 2014, the unified information system implemented blocking control which does not allow a large purchase if the customer breaches the established mandatory public discussion order.

Breach of mandatory public discussion order and timelines or failure to carry out mandatory public discussion results in an administrative fine paid by the customer.

Constituent entities of the Russian Federation and local governments can adopt legal acts establishing additional cases of mandatory procurement public discussion, as well as a specific

**Public Control as a Mechanism of the Openness of Public Procurement: Case of Russia, Table 1** The procedure for mandatory public discussion of procurement in Russia

| Stages of mandatory public discussion | Procurement cycle stage | Content | Possible consequences |
|---|---|---|---|
| Stage 1 | Planning | Discussion on the website of the unified information system | Cancellation of purchase |
| | | Discussion during the full-time public hearings | Continuation of preparations for the purchase disregarding the results of the mandatory public discussion |
| | | | Continuation of preparations for the purchase taking into account the results of the mandatory public discussion |
| Stage 2 | Procurement (posting of procurement notice) | Discussion on the website of the unified information system | Cancellation of purchase |
| | | | Continuation of the purchase without amending the procurement notice and documentation |
| | | | Continuation of the purchase with amending the procurement notice and documentation |

procedure for related mandatory public discussion. To date, 18 constituent entities of the Russian Federation and a number of municipalities adopted such legal acts, including acts providing decrease of the contract price threshold. The most common minimum threshold is 100 million roubles. The minimum threshold of indicative contract price for public discussion purposes established at regional and local level is 15 million roubles (a municipality in the Chuvash Republic). Regional and local legislation development can be seen as a positive trend in the genesis of public control system.

It needs to be mentioned that according to the analysis of statistical data, the mechanisms of public control are not functioning in full. For instance, according to zakupki.gov.ru official website, 337 mandatory procurement public discussions were posted for the total amount exceeding 1 billion roubles in 2015. The objects of procurement to be discussed were mainly construction works. Nine purchases were canceled at the first stage of mandatory public discussions, and three were canceled at the second stage. In 22 cases, customers amended planning documents, and 12 purchases were canceled (Report on results of monitoring of application of Federal law 44-FZ 2015).

The main reason for such a low performance of public control is poor feedback. State customer is not obliged to take into account public opinion during public discussion of major procurement contracts, and the legislation allows procurement without taking into account the results of mandatory public discussions. Lack of feedback contributes to mistrust of civil society in Russian state institutions, and it leads to unstable functioning of public control institutions.

Another problem decreasing the efficiency of mandatory public discussions is low motivation of public organizations. Representatives of local communities are more interested in local level issues, and it raises the question of revising the criteria for mandatory public discussion.

Despite the existence of legally binding mechanisms of public control, its impact on the procurement procedures is negligible at present. The main obstacles to the implementation of public control are:

1. *Difficulty and complexity of the legislation*. F. Simone and Sh. Shah noted that "Procurement monitoring is a complex exercise and requires an understanding of procurement processes and various monitoring techniques, as well sector-specific knowledge" (Simone and Shah 2012). In Russia, the problem is compounded by the fact that the legislation changes in a very fast way. Although public interest in this topic is very high, the share of professionals who are able to understand the process in detail is extremely small in the civil society.
2. *Low activity of civil society.* Unfortunately, Russia has no strong traditions of public organization involvement in the sphere of public administration. Modern public organizations in Russia are largely dependent on regional and local authorities and cannot work without the loyalty and support from the authorities. This has a negative impact on their efficiency. In addition, the interests of public organizations, particularly at the regional level, are concentrated mainly on local issues, mostly related to problems of social significance.
3. *Limited scope of public control procedures implementation*.

Public control procedures apply only to the customers whose purchasing activities are regulated by Federal Law 44-FZ. A substantial part of procurement, including procurement at the expense of budget funds, is affected in accordance with Federal Law 223-FZ "On procurement of goods, works and services of certain kinds of legal entities" dated July 18, 2011, which does not stipulate public control. At the same time, the share of state needs purchases carried out in accordance with Federal Law 44-FZ was not more than 5.5 trillion roubles in 2015, whereas the purchases in the framework of Federal Law 223-FZ amounted to more than 23 trillion roubles. Thus, Rosneft petrol company alone spent more than 4.5 trillion roubles last year.

Federal Law 223-FZ is less stringent than Federal Law 44-FZ (223-FZ is much less restricted and regulated than 44-FZ). In fact, Federal Law 223-FZ stipulates only the basic procurement principles and requirements for placing

information in the unified information system. Federal Law No. 223-FZ applies to state-owned corporations (e.g., RosAtom, RosNano, etc.), companies with state participation (e.g., Russian Railways), natural monopolies, regulated activity companies (electricity, gas, heat supply, water supply, and so on), state unitary enterprises and municipal unitary enterprises, autonomous organizations, as well as business entities with more than 50% shares belonging to the Russian Federation, Russian Federation regions or municipalities. They do not have a status of state or municipal customer, and they conduct their procurement activities in accordance with own procurement provisions. Indeed, organizations engaged in procurement in accordance with Federal Law 223-FZ should have a greater degree of freedom as many of them are involved in market activities and one of their work objectives is profit gain. However, given the scale of purchases and often negative public reaction, it is advisable to introduce mandatory public control of companies having large amount purchases in accordance with Federal Law 223-FZ.

## Conclusion

Public control mechanisms are essential components of modern legislation on public procurement in Russia. Despite the issues associated with the intense pace of reforms in the field of public procurement, it is possible to talk about the current system of public control enabling public procurement transparency. However, the opportunities provided by the legislation in order to implement public control are not used in full. The impact of public on the authorities in the field of public procurement is insufficient, although given the unstable economic situation, an increase of public initiatives and the start of the public dialogue with government bodies regarding budget expenditures can be expected.

A logical continuation of the changes associated with state order transparency improvement will be the work to overcome the opinion about a high degree of competitive procedures predetermination which is prevailing among Russian entrepreneurs, as well as training and information support to the public procurement market participants.

## Introduction: The Nature of Public Corruption

*Public corruption* damages the institutions necessary for effective democratic governance. Corruption is not a new problem; long before democracy was in vogue, corruption of public authorities existed. The Bible tells us that priests bribed

Roman guards to lie to Pontius Pilate about the disposition of Christ's mortal remains (Matthew 28:11–15); the Islamic scholar Ibn Khaldun (CA1332-1406) argued luxurious living caused corruption among elites; and in *Federalist Paper* 22, Alexander Hamilton (CA1755-1804) recognized that "persons elevated from the mass of the community by the suffrages of their fellow-citizens to stations of great pre-eminence and power may find compensations for betraying their trust." These examples represent corruption as a process (bribes), with causal elements (e.g., the desire for luxurious living) and consequence (betrayal of public trust). When public corruption is rampant, citizens lose faith in how their elected representatives act. The citizens are alienated from the protections necessary under the rule of law; they question the efficacy of their voice within the political system and lose any surety they had that their tax dollars are well spent. This entry briefly explores the nature of public corruption and why it is an important topic for public administration.

Abuse of public office can take many forms. Bribes can involve benefits for officials ranging from a few dollars offered to low-level bureaucrats to many billions looted by heads of state. These transactions can be demanded by a public official or a private actor may offer a bribe. Officials demand or accept a bribe because of need or greed. Often, low-level officials are corrupted by need when their society cannot pay them a living wage. In contrast, elected officials, whose offices provide for their material needs, are corrupted by greed. There are context specific exceptions to this. Payments are often money but also include sexual favors, goods, services, or a share in contraband.

Other forms of corruption that are harmful to proper public administration are nepotism and cronyism. These types of corruption enable officials to benefit relatives, friends, and political allies through unfair appointments, advantageous policies, or through the award of lucrative state contracts. Anything of value to the state can be corrupted, including the democratic process itself. Individuals, political parties, and/or governments can corrupt elections by manipulating systems through gerrymander, disenfranchisement, ballot stuffing, vote buying, and/or bribery to hold onto power. The few examples above indicate the breadth of corrupt behavior, but it provides an incomplete picture of what public corruption is. The following frames public corruption within the three branches of government – the legislature, executive, and judiciary – and outlines some of the responses to prevent public corruption.

## Defining Public Corruption

Corruption, according to the United Nations (UN), "undermines democracy and the rule of law." Corruption has no single definition; however, Transparency International (TI), the international nongovernment organization defines corruption as "the misuse of entrusted power for private benefit" (Pope 2000, p. 1). Importantly, Pope explains that within the TI definition:

> . . . there are three elements (i) a misuse of power; (ii) a power that is entrusted (i.e. it can be in the private sector just as much as in the public); and (iii) a private benefit (i.e. not necessary personal to the person misusing the power, but including as well members of his or her immediate family and friends). (Pope 2000, p. 1)

These statements from the UN and TI help frame corruption as a threat to public authority that negates the ability of elected representatives, public officials, and the judiciary to deliver the public services expected (and paid for) by the majority populace. Furthermore, corruption can undermine the electoral process, thereby delivering illegitimate government. The definitions are also broad enough to capture private-sector corruption; however, for the interaction between corruption and democracy the element of "entrusted power" can be read as "public office." However, public offices vary greatly, providing different services to citizens, and the role of an office can shape the public corruption opportunities commensurate to its function.

## Discerning Corruption from *Public* Corruption

A simple taxonomy of public corruption illustrates some of the unique opportunities related to

various public offices. Corruption as a general concept sits at the peak. However, as Hindess (Hindess 2012) has argued, the term's true meaning and understanding rests contextually in the temporal, geographic, and political setting. Analytically, corruption requires a descriptor, and these descriptors shape our understanding of the corruption taxonomy. The second level is *public* corruption, which occurs to varying degrees in all the functions and agencies of the state. The triumvirate of state functions commonly found in democracies are the legislative, executive, and judicial branches of government, which in turn create, execute, and interpret the law within society through a variety of institutions and agencies.

## Corruption in the Legislature and Political Processes

Corruption within the legislature takes many forms. Legislators possess the same human fallibilities that belong to all public officials. Corrupt legislators demand and accept bribes; they appoint unqualified family and friends to public office while undertaking other varieties of misconduct involving the misuse of the power delegated to them by voters. This brief set of examples is worrisome; however, three types of corruption have greater negative influence on the legislature – grand corruption, state capture, and electoral corruption.

### Grand Corruption

*Grand* corruption refers to the pillaging of national resources by political leaders who have been either elected or seized power through other means. Since the end of World War II, a string of national leaders often supported by powerful states have taken advantage of their position to illicitly enrich themselves. Many examples exist. In Asia, former President Marcos of the Philippines (1965–1986), declared martial law in 1972, established a dictatorship, and surrounded himself with political cronies to enable his looting of billions of dollars from the treasury and World Bank funds (Chaikin 2001). In Africa, Liberian President Charles Taylor fuelled conflict in neighboring Sierra Leone by selling arms to rebels for blood diamonds and depleting his nation's timber resources (Global Witness 2012). In North Africa, the Libyan dictator Moammar Gadaffi spent decades diverting public funds to his overseas personal bank accounts. While these examples of public corruption appear biased against developing and less developed nations, it must be remembered the looting occurred with the complicity of banks in the most advanced countries. Furthermore, the following discussion on state capture shows how legislators in developed countries are also susceptible to corruption.

### State Capture

*State* capture occurs when private interests gain control of the state through legal means. Johnston (2005) describes this process as one of influence markets, through which various interests gain benefit by subverting governance processes. The (in)famous Teapot Dome scandal in the USA occurred in 1922, when Interior Secretary Albert G. Fall with the knowledge of Attorney General Harry Daugherty issued favorable leases for US Naval oil reserves at the Teapot Dome in Wyoming to Harry Sinclair of Sinclair Oil and leased the California reserves to Edward Doheny of Pan American Oil. Fall and Doheny were jailed for corruption after investigations found Fall had been paid more than half a million dollars – either directly or through front companies – to secure the leases.

Although the Teapot Dome is nearly a century old, similar activities continue to occur. In 2013, the New South Wales (NSW) Independent Commission Against Corruption (ICAC) investigated the activities of the NSW Minister for Energy, Ian MacDonald and the family of Edward (Eddie) Obeid senior, a former member of the NSW Parliament over the issue of coal exploration licenses. The ICAC found MacDonald, Obeid, and Obeid's son Moses established the Mount Penney tenement, provided favorable treatment to certain investors, and, along with others, worked to cover-up the involvement of the Obeid family to deceive other parties and the NSW authorities (ICAC 2013a). Furthermore, MacDonald had granted exploration licenses to John Maitland

expressly for Maitland's benefit. Maitland and MacDonald then made false statements to the Department of Primary Industries, again to deceive NSW authorities and substantially benefit from undervaluation of coal reserves (ICAC 2013b). This is only a partial account of the involvement of the Obeid family in corrupt practices in New South Wales.

### Electoral Corruption

*Electoral* corruption refers to the manipulation of democratic processes to attain and retain an elected office. Electoral corruption can transpire in all three functional areas of governance, dependent on the penetration of democratic norms. In some jurisdictions, judicial and executive officers are elected as well as the members of the legislature. Under the parliamentary Westminster system found in the United Kingdom, Canada, Australia, New Zealand, and other Commonwealth nations, the ministers of state who form the executive cabinet are drawn from the elected legislature. Occupants of these powerful positions attain their place through a combination of experience, seniority, negotiation, and politicking among representatives of the elected ruling party. In presidential systems, the heads of executive agencies can be appointed with or without the benefit of checks and balances. In the USA, presidential appointments are subject to Congressional approval, thus minimizing the opportunities for common forms of corruption like nepotism or cronyism to occur unchecked.

Electoral corruption has multiple forms. It can involve the manipulation of the electorate through vote buying. The machine politics of Tammany Hall in nineteenth century New York is a classic example of this. Tammany Hall secured its political powerbase by providing employment, welfare services, education, and other public goods to newly immigrant communities and the socially disadvantaged in exchange for their electoral support. This endorsement provided cover for other corrupt practices – principally fraudulent procurement and land speculation (Gill Hearn 2008). Ghost voters and ballot box stuffing are other well-recognized forms of electoral corruption. Where a roll of voters is required, ghost voters exist only on paper but effectively provide the numbers at election time to ensure a preferred candidate wins or maintains their office. Ballot stuffing occurs when voting is anonymous; additional ballots favoring the corrupt candidate are literally stuffed into the ballot box. Variations on the theme of ghost voting and ballot box stuffing can take a local flavor. The Australian Labor Party is regularly accused of branch stacking, whereby real people are signed up to branches of the party and their votes used to undermine supposedly democratic elections of candidates for local, state, and national election.

## Corruption of the Executive

### Corruption in Public Procurement

One of the most important roles of the executive involves the use of state funds to acquire goods and services on behalf of the broader society. According to the Organization for Economic Cooperation and Development (OECD 2011), procurement represents 12–15% of global gross domestic product; this translates into many billions of dollars. Procurement processes remain targets of corruption due to the amount of money involved, the opportunities created by the multiple processes expected in public expenditure (Ware et al. 2011). The World Bank and other development agencies are concerned about corruption in public procurement as it undermines the effectiveness of the development agenda. In a globalized world, concern at the scale of corruption in procurement processes, in particular the bribing of public officials by transnational corporations to secure contracts, resulted in the creation of the OECD's *Convention on Combating Bribery of Foreign Public Officials in International Business Transactions*. Since the convention's entry into force in 1999, there have been over 400 cases brought against companies; 57% of these cases involve public procurement (OECD 2014). The case against the German multinational Siemen represents the largest case of procurement corruption to date. Siemen's had systematically paid more than 4000 bribes valued at $1.4 billion to secure procurement contracts in the transport,

security, energy, and communication sectors in dozens of countries (*United States Security and Exchange Commission v. Siemens Aktiengesellschaft* 2008). The prosecution of Siemens in the USA and Germany resulted in over €1.8 billion in fines and sanctions against the company (OECD 2014). In the Siemen's case, it is likely the goods provided met purchaser requirements; the negative effect of this corruption was principally economic with taxpayers over-charged in an uncompetitive market.

Corrupted procurement processes also have a social impact. In the health sector, the purchase of counterfeit medical products facilitated by corrupt practices can lead to injury and death (TI 2006). Corruption has been shown to correlate with increased deaths due to infrastructure failure in times of disaster (Ambraseys and Bilham 2011). It is important these impacts are not lost in the regular discussion of corruption in economic terms.

## Police Corruption

To continue the discussion of the social impact of corruption by the executive arm of government, we now turn to *police* corruption. In thinking about police corruption, we need to understand that *public* corruption can occur without *private* benefit. Police corruption represents a form of public corruption where the absence of private benefit sometimes occurs. Weber (1947, pp. 146–147) tells us the state has a monopoly on the legitimate use of violence, and the state delegates the internal use of violence to police and other law enforcement authorities. Therefore, police corruption should be part of any discussion of public corruption.

More than four decades ago, Sherman illustrated the problem of defining police corruption:

> The term "police corruption" has been used to describe a multitude of sins. Brutality, fabrication of evidence, sleeping on duty, nepotism, racism, bribery, and theft have all been described as corrupt police behaviour. In order to narrow our definitions, we should begin with the assumption that a corrupt act by an officer serves a personal, and not an organizational, interest. Wiretapping, fabricating evidence, and even brutality are used to "fight crime" and not fatten policemen's wallets. (Sherman 1974, p. 5)

Eventually, he dodged this problem by taking "the easy way out and defin[ing] corruption simply as bribery…" (Sherman 1974, p. 5). Sherman's approach, while analytically useful falls short when confronted with the contemporary issues of public corruption. Other police researchers have developed many definitions of police corruption, yet all seem to fall short of the precision and elegance preferred by social scientists. Newburn (1999, pp. 4–13) presents a detailed discussion on the problems associated with neatly defining police corruption, yet he also opts out of presenting a definitive description. Newburn does, however, offer Kleinig's definition as perhaps the most inclusive in that "[p]olice officers act corruptly when, in exercising or failing to exercise their authority, they act with the primary intention of furthering private or departmental/divisional advantage" (Kleinig 1996, p. 166, cited in Newburn 1999, p. 7). Irrespective of the lack of a final definition, this remains one of the most concerning forms of public corruption due to the executive, and sometimes judicial, powers entrusted to police.

## Judicial Corruption

*Judicial* corruption, according to TI (Rodriguez and Ehrichs, 2007, p. xxi) "includes any inappropriate influence on the impartiality of the judicial process by any actor within the court system." Furthermore, they see the two main types of corruption affecting the judiciary are political interference by the executive or legislature and bribery. Corruption in the judiciary is problematic as the rule of law is essential in preventing public corruption.

Italy provides an example of the problems a nation faces when fighting corruption when the executive and legislature interfere with judicial processes. Della Porta (2001) described the post-war Italian judiciary intertwined in a deferential relationship with the politicians in power. This relationship lasted well into the 1990s, when a new generation of justices (*giudici ragazzini* – child-judges) "lacking any sense of deference towards political power, and conscious of the high levels of collusion between politicians and organized crime – began a series of

investigations into administrative and political misconduct" (p. 5).

> . . .while The Italian magistracy has demonstrated a singular ability to uncover the corruption of politicians, a significant number of Italian judges has nevertheless been accused of colluding in corrupt political practices. Italy seems therefore to have the most committed judges in the struggle against corruption, but also more than a few judges involved in impropriety. (Della Porta 2001, p. 1)

The behavior Della Porta describes reflects a society experiencing dysfunctionality across all the branches of state – a worst case scenario of public corruption. Yet, even when only a small number of judicial officers are corrupt, the damage they do to society is disproportionately high.

In the USA, two Pennsylvania judges were convicted for accepting $2.6 million in kickbacks over a 7 year period from the operators of two private prisons for juveniles. They arranged funding for two private detention centers to be built, they had the state-funded center closed down, then for a kickback, ensured the private prisons remained at full capacity (*United States of America v. Michael T. Conahan and Mark A. Ciavarella Jr.* 2009). The judges would remand juveniles in custody for minor infractions, often against the recommendations of probation officers. Examples included a juvenile jailed for creating a webpage mocking her vice-principal, another for trespassing, and one for a minor shoplifting offense. Sometimes, the juveniles remained in custody for many months before their cases were heard and then, more often than not, the matters were dismissed (Ecenbarger 2012). The demand for payment by these judges adversely affected hundreds of families and undermined public faith in the legal system.

## Dealing with Public Corruption

While corruption is unlikely to vanish completely from public life, the application of democratic values can help mitigate it. Many scholars hold that democratic values include the rule of law, equality, transparency, and accountability. These four values play a strong role in countering corruption in society.

### Rule of Law and Equality

Despite the disturbing cases of judicial corruption cited above, proper application of the rule of law remains a potent tool against corruption. When societies are perceptibly more equal in the eyes of the law and in terms of opportunity, they are less corrupt (Uslaner 2008). Political scientists have found that public perceptions societal corruption tracked very closely with how equally people were treated under the law. When they are aware of inequality and can see elites corruptly exploiting society, the average citizen is less inclined to contribute to their society – for example, through their own honest behavior or payment of taxes. Put simply, to be rid of corruption it cannot be one rule for the rich and another for the poor.

Internationally, action has been taken to criminalize the misuse of authority by the powerful. Two significant international instruments – the aforementioned OECD Bribery Convention (1999) and the UN Convention Against Corruption (UNCAC) (2003) – provide a standard for national and subnational legislative frameworks to deal with corruption. Signatory and ratifying countries have the institutional arrangement that outlaw specific corrupt behavior, such as bribing national and foreign public officials, misappropriation of public property, trading in influence, or illicit enrichment. While corruption still occurs in signatory countries, appropriate sanctions are available under the rule of law.

### Transparency

It is no accident that the civil society organization for combating corruption is called Transparency International. Corruption by its very nature is hidden because those involved have a vested interest in secrecy. The main victim of corruption is society at large. Therefore, if the affairs of state are transparent and open to public scrutiny, through means such as registers of pecuniary interest for officials and compulsory disclosure of gifts, there is less opportunity for corruption.

Khaldun's reference to "luxurious living" provides a window into when corruption occurs. One could ask how the former president of Equatorial Guinea and his family owned a fleet of Ferraris

and Maseratis, parked at their townhouse on the Champs-Élysées in Paris. These assets are generally not commensurate to a public salary – even for a head of state. When a society is transparent in both its own dealing and those of its officials, corruption becomes more difficult.

### Accountability

Democratic accountability requires elected and appointed public officials to be answerable for their decisions and actions to the majority. When Hamilton's elevated persons find their "compensations for betraying their trust" the mechanisms of democratic accountability, such as elections or impeachment, should soon find them out of office and possibly in jail.

## Conclusion

Public corruption is a many-headed beast. The examples provided above encompass both developed and developing nations, indicating a certain universality to the problem of corruption. While some commonality (e.g., bribery) can be found across all forms of public office, corruption follows the opportunity structures when the powerful wish to misuse their entrusted authority. Public corruption advantages the minority at the expense of the majority in both financial and social terms. The development of democratic social norms with a genuine commitment to rule of law, equality, transparency, and accountability provides a platform from which to counter corruption. Like all aspects of public administration and governance, anticorruption measures require the collective will of the majority to be effectively implemented and continued vigilance for them to be sustained.

## Synonyms

Diplomacy; Global public relations; International relations; New public diplomacy; People's diplomacy

## Definition

This chapter provides a discussion of public diplomacy through the lens of conceptualizations of in public relations and diplomacy research.

## Introduction

Public diplomacy has been defined variously by scholars. There is a myriad of views, confusing perspectives, and counter views on what public diplomacy is. Much of this is owing to public relations and diplomacy scholars holding opposing views about public diplomacy. Public relations scholars have gone as far as conceptualizing public diplomacy as an "international public relations" function with national or governmental goals (Rasmussen and Merkelsen 2012). This view is vehemently opposed by diplomacy scholars who see the field as independent of public relations. Most align public diplomacy instead with business, marketing, branding, and sales where they are trying to sell the idea of their government to other nations.

Of the articles reviewed for this chapter, only a couple mention public relations as a skill for public diplomacy. Even when they mention public relations, it appears they mean publicity or marketing. The result of this is a dichotomy of views reflected in the literature and practice of public diplomacy.

This chapter comes from a place of this misunderstanding between the two fields owing to a lack of communication and integration between practitioners in the both fields. Thus, depending on the field from which young scholars first encounter public diplomacy, their understanding of the field and scholarship on it is skewed one way over the other. Could there, however, be a more encompassing way of seeing public diplomacy that takes into account the different strategies and advances in both fields?

This chapter takes a step away from the clutter and attempts to provide a comprehensive view of the field. To do this, I bring together and critique literature from diplomacy scholars and public relations scholars in an attempt to explore and understand what it all means. I address the following questions:

1. What is public diplomacy?
2. Who are the "publics" in public diplomacy?
3. What are the dimensions of public diplomacy?

Each question is discussed in detail as a synthesis, critique, and proposal of what a reconceptualized public diplomacy may look like. I conclude by providing three key findings from the study. First is that there is a need for a multifaceted approach to public diplomacy given the multiplicity of players, publics, and dimensions. To that I ask if perhaps there is a need to begin speaking of a publics' diplomacy which both accounts for and recognizes the myriad publics – unlike traditional conceptualization of

diplomacy – and, in that, gives the power of diplomacy back to the publics in the sense of what Hocking (2005) referred to as diplomacy *by* the publics. Lastly, I propose the need for more empirical research on what will serve as a diplomacy of unreached people. That is, the other half of the world that has no access to information technology.

I begin with an exploration of the most fundamental question: What is public diplomacy?

## What Is Public Diplomacy?

Despite differences, public relations and public diplomacy scholars seem to agree on a basic conceptualization of public diplomacy: that it is about a government's efforts to establish a relationship internationally. Tennessee professor of public relations and diplomacy, Candace White in her 2014 paper with Danijela Radic on "Comparative public diplomacy" provided a definition of public diplomacy that captures the idea of public diplomacy commonly found in the literature:

> Public diplomacy is a nation-state's attempt to favorably influence public opinion in other countries, which relies on and helps build national reputations. (p. 461)

White and Radic (2014) describe public diplomacy in terms of governments' activities to influence public opinion in other nations using their reputation as the tool and, through this act of influencing, further building national reputation. This more traditional view of public diplomacy is faulty on several grounds – particularly on the basis of several assumptions made.

First, there is the assumption that the government engaging in public diplomacy has a reputation to leverage on. This may not be the case. A government may have a poor reputation among people in another country. A 2005 to 2006 BBC survey conducted by global opinion polling firm, GlobeScan Incorporated in collaboration with the Program on International Policy Attitudes at University of Maryland found that not a single one of the 33 countries surveyed had a mostly positive view of Iran's role in the world (Global Poll: Iran Seen Playing Negative Role n. d.). This is probably attributable to Iran's nuclear project around the time. Nonetheless, it underscores the point here that a government may have mostly a poor reputation. Yet, it must engage in public diplomacy.

Second, they assume that public diplomacy is carried out by nation-states. This is somewhat faulty since stateless nations also engage in public diplomacy. In their study, Xifra and McKie (2012) demonstrated how Catalonia – a stateless nation off the coast of Spain – uses noopolitik and public diplomacy to stay globally relevant. They use their widely acclaimed football team named after the city, Barcelona, as ambassadors reaching publics beyond Spain and promoting a good image of Barcelona, thus building cordial relationships, tourism among other things. Catalonians also quickly form strong Catalan Communities Abroad which serve functions that may be likened to embassies in more traditional diplomacies.

Third, public diplomacy, while generally transnational in goals, may equally be aimed at domestic publics as seen in Servaes' (2012) study of the Chinese government's public diplomacy aimed equally at the Chinese people. According to City University of Hong Kong professor, Dr. Ni Chen's analysis, "solidifying its domestic legitimacy always seems to be an integral part of the Chinese government's strategy in pursuit of a favorable international image." The goal in hosting events such as the Beijing Olympics (2008), the Shanghai World Expo (2010), the 2010 Asian Games, as well as opening the Confucius Institutes was in part to bolster the administration's internal legitimacy. Similarly, internal publics may also be foreign nationals living within the nation or intermestic publics.

Finally, White and Radic (2014) present reputation as both the tool and perhaps the goal of public diplomacy since, after all, if other nations have a good opinion of a country, it boosts the country's reputation. Again, this is faulty in that while reputation may serve as a sort of lubricant in public diplomacy (van Ham 2005), it is neither "the" tool nor the outcome of effective public diplomacy (although one may see it as a sort of by-product of good public diplomacy). Perhaps a better definition or a more comprehensive

encapsulation of what public diplomacy is can be found in L'Etang (2009):

> Public diplomacy can be defined as an activity conducted by nations (stateless and otherwise), organizations, which operate globally (national sporting bodies, tourist bodies), global organizations (corporations such as Nike and non-governmental organizations [NGOs] such as the International Olympic Committee, World Health Organization, and the Catholic Church), and international political organizations advocating change (Greenpeace). Public diplomacy includes interpersonal debate and negotiation between professional diplomats ranging from international treaties, reparations, commercial and trade agreements, economic and development aid, and ecological practices to framework agreements for educational and cultural exchanges. All entail[ing] a range of promotional and persuasive strategies and techniques in addition to media relations. (L'Etang 2009, p. 610)

While this is good, there are two challenges with this encapsulation. First, public diplomacy is not the exclusive preserve of professional diplomats. (This will be discussed later in the chapter.) Also, missing in this definition are the goals (or outcomes) of public diplomacy. According to former US diplomat, Hans Tuch, the goal of public diplomacy is "to bring about understanding for its nation's ideas and ideals, its institutions and culture, as well as its national goals and current policies" (Tuch 1990, p. 3). Although Tuch also falls into the snare of seeing public diplomacy in terms of a government's actions alone, the goals of public diplomacy as he puts it are quite right. Public diplomacy seeks to bring about understanding.

In the words of Joseph Nye – political scientist and former head of the Harvard Kennedy School of Government who conceptualized "soft power" in his 1990 book called *Bound to Lead* – public diplomacy (and soft power) is often in the struggle for hearts and minds. It is about getting others to "want what you want."

Packed in those two views of the goals of public diplomacy is everything that a nation or organization may have as its goals in engaging in public diplomacy – from winning over allies, attempting to change feelings and attitudes toward one's nation by broadcasting positive images and flooding their media with favorable narratives, and sponsoring exchange programs for more personal and relational development to garnering internal support for war. If others have the same desires as you, then there should be no conflicts. In fact, it may even provide referent power and an extent of security – whether economic, political, or social.

To the extent that governments engage in public diplomacy because they want to add to the narrative about themselves, the view by former director of British Foreign Policy Centre, Mark Leonard, in his 2002 book, is very apt. Public diplomacy involves direct government information and building (long-term, cultural) relationships. Governments want to show target publics who they are and tell their own stories through culture sharing and diplomacy.

One common theme in the literature by scholars of diplomacy is that public diplomacy particularly differs from traditional diplomacy. The phrase often used is *new public diplomacy*. One obvious distinction between traditional diplomacy and the new public diplomacy is that while traditional diplomacy has been by one government to another government, public diplomacy is diplomacy geared primarily at (nongovernmental) individuals and organizations (Nye 2004). In consistency with being different from the old, state diplomacy (in the more traditional sense) may be backed by military force, but cultural diplomacy is long term and aimed at winning "hearts and minds."

Professor Jan Melissen, head of the Clingendael Diplomatic Studies Program at the Netherlands Institute of International Relations, provides us with three distinctions that set the new public diplomacy apart from traditional diplomacy. First is that the new public diplomacy is not hierarchical. While traditional diplomacy uses hierarchical systems, the new public diplomacy operates a network system. This means that the new public diplomacy practice acknowledges players other than the government and also that every player needs to learn from the others. Second is that information flow is two-way and not the one way of traditional diplomacy. This may be likened to the mixed-motive model in public relations. The new public diplomacy thus has to be

thought of like a conversation of influence or a dialogic relationship. It is about listening and identifying values shared with target publics.

Finally, Melissen (2005) described a third feature that distinguishes "public affairs (aimed at domestic audiences) from public diplomacy (dealing with overseas target groups)" (p. 13). However, as discussed earlier, this third perspective may not hold so true as even the "new public diplomacy" is in a continuous state of flux and may be directed at domestic audiences. This thus begs the question: who is the "public" in public diplomacy? which I turn to in the next section.

## Who Is the "Public" in Public Diplomacy?

Professor and director of the Centre for the Study of Foreign Policy and Diplomacy at Coventry University, Brian Hocking, in a 2005 article titled "Rethinking the 'New' Public Diplomacy" proposed what may serve in part as response to the question of whom public diplomacy should be concerned with. He identified four views of "publics." One view of publics sees the public as the target of influence, that is, "generating pressures on foreign governments through their own domestic constituencies, or even acting as an indirect tool in influencing opinion at home" (p. 32). This is perhaps the most common view of publics outside the domain of traditional diplomacy where the target audience is another government. This is also what is often referred to by many scholars when asserting that public diplomacy is about affecting or influencing public opinion. Here, activities of public diplomacy are directed at this public to influence their opinions and beliefs and inadvertently recruit them as agents of internal pressures to actualize the goals that the source of the diplomacy has.

An example is the effort by the United States to shape the way it is seen in the Middle East through media broadcast tools such as Alhurra – a public, Arabic satellite TV channel – and Radio Sawa all geared toward adding US voice to the narrative about the United States among Muslim and Arabic nations. Similarly, the United States uses the Fulbright and other cultural and academic scholarship programs to attract young people and key individuals from around the world to experience first-hand life in the United States. This method, according to Nye (2008), is the most effective at building long-term relationships. More than 700, 000 people have been part of US exchange programs including global leaders: Margaret Thatcher, Helmut Schmidt, and Anwar Sadat, among others.

The second view of publics sees the publics as "a mode of influence on foreign policy-makers generated by media manipulation of public opinion" (Hocking 2005, p. 32). In this view, the media and agenda setting goals are identified as shaping public views. However, rather than directing the public to put pressure on their own governments, the goal of the influence is to put pressure on a government other than that public's own government. This may be extended to mean that in the turn of things, these publics may place pressures on their own government with the goal of having their own government put pressure on a foreign government to act on an issue.

A good example is the Bring Back Our Girls campaign that started in Nigeria in 2014 following the kidnapping of over 200 girls from their school in Chibok in Northern Nigeria by the Boko Haram terrorist group. Protests in Nigeria were covered by foreign media which broadcasted the story of the missing girls and the inaction of the Nigerian government. This then resulted in a global protest. Most participants in these protests, including then First Lady of the United States, Michelle Obama, and Nelson Mandela's widow, Garça Machel who broke her mourning to send a message of solidarity to the girls and their parents, acted to pressure the government of Nigeria to take action on the kidnapping. These pressures eventually led the government of then president, Goodluck Jonathan, to launch efforts to go after the Boko Haram group in hopes of rescuing the girls. Pressures also meant that foreign governments sent military support in aid of the process.

Similarly, the third view sees public diplomacy as being "increasingly defined as diplomacy *by* rather than *of* publics" (Hocking 2005, p. 32; emphasis his). This emphasizes the roles of individuals and organizations as active participants in

shaping international policy development through communication and information technology tools – particularly the Internet and social media. "Individuals and groups, empowered by the resources provided by the CIT revolution . . . are direct participants in the shaping of international policy and, through an emergent global civil society, may operate through or independently of national governments" (p. 32).

Transnational organizations like the United Nations, European Union, African Union, or the Economic Community of West African States (ECOWAS) readily come to mind, but other non-governmental organizations like Greenpeace also exist to influence foreign policy without the backing of any governments. Perhaps not directed at foreign policy but certainly affecting the soft power, image, and strength of America's public diplomacy is the Black Lives Matter movement which cries against brutality directed at black people by government agents. An important distinction is that #BlackLivesMatter started as a hashtag movement on social media rather than an organization with a central unit directing its affairs. It has been effective in directing the narrative on the lives of black people and police brutality in the United States. Images, fueled and given life through the Internet, are broadcast across borders, thereby influencing the opinion other nations have on the issue of racism in the United States and thus, to some degree, weakening America's soft power.

The last of these views sees publics as "neither a target nor a generator of diplomatic activity but as a consumer of diplomacy, a reflection of global mobility and the twin forces of tourism and terrorism" (Hocking 2005, p. 32). As people continue to travel, migrate, tour, and sometimes face the unfortunate peril of terrorism, public diplomacy becomes even more complicated requiring greater attention to efforts. In this fourth view of publics, there are also other publics who, like bystanders, are also consumers of public diplomacy. When President George W. Bush delivered his 2002 State of the Union speech, he referred to Iran, Iraq, and North Korea jointly as the axis of evil. This message was prepared for and delivered to a local audience. However, foreign publics (referred to in this view) were also consumers of the message and did not react favorably to the phrase or the idea of lumping such disparage diplomatic situations together in that way.

In addition to this variant is the reality that domestic publics also travel, and in traveling, they often encounter diplomatic messaging by their governments. These may be messages directed at other publics but may also be messages directed at them. More so, how these domestic publics are treated by their consulates abroad affects the effectiveness of the nation's public diplomacy and soft power. This diaspora diplomacy refers to diplomacy directed at diaspora and transnational communities. There is much for governments and consulates around the world to learn from the actions of the Mexican government toward its citizens in the diaspora. Mexico enjoys continued identification with and diplomacy for Mexico by nationals living abroad who know their government cares for them and so want to give back by becoming representatives of their country around the world (Bravo 2016).

Furthermore, there are several other categories of publics that appear in the literature which may not fit into the strict frame of what Brian Hocking provides us with. For example, his framework does not cover other targeted publics such as domestic audiences living at home or international domestic publics – intermestic diplomacy. There is also "reverse diaspora diplomacy" where those living in the diaspora return home and begin to serve almost as emissaries of the host nation they were living in while abroad. There also exists niche diplomacy of specialization and "corporate diplomacy" – where traveling done by the "International business class complicates and to some degree dilutes processes of traditional international diplomacy." According to Nye (2008), Germany was the first to target political parties in establishing relationships with political parties of different nations as opposed to the governments as is practice. Also, to the extent of Russia's alleged involvement in the 2016 US presidential elections, it is clear that there is a continued expansion of the publics for whom public diplomacy efforts may be targeted.

In the next section, I continue this discussion by providing a synthesis of the literature on the dimensions of public diplomacy. So far, this chapter has attempted to answer the question, "what is public diplomacy?" From that discussion came the question on who the publics of public diplomacy are. In this final section, I complete this synthesis by turning to a discussion of the dimensions of public diplomacy. Perhaps these dimensions may be thought of as a discourse on the ways public diplomacy is practiced. To that extent, a little of this has already been mentioned, but a fuller discussion follows in this next and final section.

## What Are the Dimensions of Public Diplomacy?

There are three major dimensions to public diplomacy commonly identified in the literature. First is daily communication to inform and educate publics on the contexts for domestic and foreign policy decisions. Second is strategic communication and theme-based campaigns – centered around themes that advance particular governmental policies or goals – in a similar fashion as a political or advertising campaign. This is the dimension most thought of when speaking of public diplomacy. Most practitioners simply aim at pouring out information strategically with the hope that it will be sufficient in winning hearts and mind. However, strategic players know that this is never enough.

On the other side of the spectrum is the third and often less considered dimension of public diplomacy: the "relational public diplomacy" (Bravo 2016, p. 289) or cultural diplomacy (L'Etang 2009) which refers to the strategic development of long-lasting relationships with key members of foreign societies. This is arguably the most essential and most enduring of all dimensions. It is accomplished through educational exchanges such as the Japan Exchange and Teaching (JET) Programme which since inception in 1987 has brought over 68,000 people from 73 countries into grassroot cultural exchange with Japan. Participants serve as assistant language teachers (ALT), coordinators for international relations (CIR), or sports exchange advisors (SEA). In a similar vein, China has the Confucius Institutes setup around the world.

On this third dimension, US founding father and third president, Thomas Jefferson, in a 1785 letter to James Madison, said:

> You see I am an enthusiast on the subject of the arts. But it is an enthusiasm of which I am not ashamed, as its object is to improve the taste of my countrymen, to increase their reputation, to reconcile to them the respect of the world and procure them its praise. (p. 316)

Practitioners must balance these three dimensions in order to develop effective public diplomacy strategies. The argument toward effective public diplomacy however goes beyond simply mixing all three dimensions to recognizing that there may be other dimensions outside the domain of government efforts as already discussed. "Government communications are only a small fraction of the total communications among societies in an age that is awash in information" (Nye 2008, p. 104).

Businesses are relevant here as corporate diplomacy is a fourth dimension that must also be taken into account if a government hopes to achieve effective influence. German editor and Stanford courtesy professor, Josef Joffe, labels this the HHMMS which refers to a syndrome of Harvard, Hollywood, MacDonald's, and Microsoft. This is in light of the global influence these companies have had as US companies and the soft power they have generated for the United States. Joffe argued that this soft power has served the United States as an asset much larger than even its economic and military power(s) (Nye 2008, p. 96). Van Ham delineates this syndrome as "'Harvard' (which stands for intellectual power) . . . 'Hollywood' (superiority in popular culture) . . . 'McDonald's' (US dominance in popular food chains), and 'Microsoft' (technological supremacy)" (van Ham 2005, p. 55).

Because of its influence, Hollywood is granted access and assistance in the production of war-related films. The military has offices that help liaise these collaborations such as the Army's Office of the Chief of Public Affairs, Western

Region (OCPA-West), the US Coast Guard Motion Picture and Television Office, and the Air Force Entertainment Liaison Office. These offices provide support to make these movies historically accurate and authentic, thus making them more appealing and enabling to the military's soft power.

On the other end too, it can be argued that many products of American businesses enjoy a lot of patronage simply for the fact that they are "American." In Nigeria, for example, many people want to buy and use products that are American because they have associated symbolic meanings of good quality, exquisiteness, and class. As a result, it is okay for the same product or service to be more expensive because it is American.

Ironically, the corporate leadership image that these create for America also leads the HHMMS to be a love-hate syndrome where the relationship is in flux between these two emotions. Joffe sees it as a seduction which is worse than imposition. "It makes you feel weak, and so you hate the soft-pawed corrupter as well as yourself. . .rooted in feelings of powerlessness and humiliation. . ." (van Ham 2005, p. 55). He cites the Arab anti-Americanism as an instance of this syndrome.

Furthermore, a fifth dimension of the new public diplomacy is the role of social media and information and communication technology (ICT). This is what makes the new public diplomacy particularly unique. This is referred to as cyber-diplomacy in the literature (see Potter 2002), "linking the impact of innovations in communications and information technology (CIT) to foreign policy and diplomacy" (Hocking 2005 p. 30). This is in line with the view of publics as actors rather than simply consumers in the new public diplomacy discussed in the earlier section.

The Internet has been great in providing access and adding more players to diplomacy. This has also resulted in a proliferation of information or the *paradox of plenty* as Simon Herbert puts it. Joseph Nye (2008) established that "plenty of information leads to scarcity of attention" (p. 99), and this "places a premium on the capacity to sift valuable information from 'white noise'" (Hocking 2005, p. 40). Nye argued that when overwhelmed with so much information, it becomes hard for people to know what to focus on, thus making "attention rather than information" (2008, p. 99), the scarce resource. In other words, those who are able to pick out the salient and needed information out from the clutter become the most relevant.

The sixth dimension which is also closely tied to this is the news media or what has been referred to as the CNN effect – a metaphor for media and its role in agenda setting and disseminating more information directly to publics than was traditionally available. Livingston (2002) even suggests a post-CNN effect with the proliferation of users with the Internet, miniaturization of technological devices, and availability wireless communication granting access to millions of people and making the traditional confidentiality of diplomacy more and more eroded.

A major caveat to the last two dimensions of diplomacy however is that there exists a digital divide in the world (Livingston 2002). As can be seen from Table 1, only about half of the population of the world has access to the Internet with majority of these living in Asia and the highest penetration rates in North America, Europe, and Oceania/Australia. If public diplomacy is about winning hearts and minds, then there is a fundamental challenge to the emphasis on cyber-diplomacy and the CNN effect as the future for effective diplomacy. Seeing public diplomacy almost exclusively in terms of ICT and social media means that the digital divide is ignored and along with that is the remaining half of the world.

The argument here is not to forego the role of cyber-diplomacy. Rather, the goals should be a narrowcasting via the Internet. Recognizing that the Internet reaches only a small portion of the world, narrowcasting may be reconsidered as a way of not leaving out the Internet but using it to reinforce efforts made through face-to-face exchanges. This will allow for the targeting of particular groups (the elite) and provide "a way to transfer information to countries where the government blocks traditional media. . ." (Nye 2008, p. 104). The Internet can also be used to create and maintain an alumni body of exchange

**Public Diplomacy, Table 1** World Internet usage and population statistics

| World Internet usage and population statistics<br>March 2019: Update | | | | | | |
|---|---|---|---|---|---|---|
| World regions | Population (2019 est.) | Population % of world | Internet users Dec. 31, 2018 | Penetration Rate (% pop.) | Growth 2000–2019 | Internet users% |
| Africa | 1,320,038,716 | 17.0% | 464,923,169 | 35.2% | 10,199% | 10.8% |
| Asia | 4,241,972,790 | 54.7% | 2,160,607,318 | 50.9% | 1790% | 50.1% |
| Europe | 866,433,007 | 11.2% | 705,064,923 | 81.4% | 571% | 16.3% |
| Latin America/ Caribbean | 658,345,826 | 8.5% | 438,248,446 | 66.6% | 2325% | 10.2% |
| Middle East | 258,356,867 | 3.3% | 170,039,990 | 65.8% | 5076% | 3.9% |
| North America | 366,496,802 | 4.7% | 345,660,847 | 94.3% | 219% | 8.0% |
| Oceania/Australia | 41,839,201 | 0.5% | 28,437,577 | 68.0% | 273% | 0.7% |
| World Total | 7,753,483,209 | 100.0% | 4,312,982,270 | 55.6% | 1095% | 100.0% |

participants as Japan does with the JET exchange program. The Fulbright commission also does this as it has an alumni body to which every member of the Fulbright is registered. There are also incentives to keep members connected such as periodic competitions to share experiences on the Fulbright as well as attractive research grants that are exclusively available to Fulbright alumni.

Beyond narrowcasting and cyber-diplomacy, however, there is a need for more scholarship on how to reach groups that do not have access to the Internet or other forms of ICT. What is the public diplomacy of unreached groups? How would they get to participate in policy debates? What is the influence of small localities on nation branding and relationship building? An example can be borrowed from Nigeria which has a program known as the National Youth Service Corps. In this program, university graduates serve as educators or work in government offices for 1 year in a local community and ethnic group other than their own.

This program was designed as a way of overcoming the rift that had come from the civil war. It enables increased understanding between different cultural groups, thereby fostering an acceptance of cultural relativity among Nigerian graduates. Most importantly, it has brought about a penetration and transfer of skills to these hard-to-reach areas. The effectiveness of this, although not yet quantified by empirical evidence, is the voice it gives to members of these remote societies to participate in the conversations that will ultimately shape national policies as graduates complete their programs and return to the cities either to join the government or take on new jobs. Perhaps this may be a final dimension of public diplomacy – one that is designed to facilitate relationship building with communities hitherto unreached by Internet or traditional diplomacy.

## Discussion and Conclusion: Implications of a Publics' Diplomacy

Much of what has been written about public diplomacy has been about creating a national image. Zhang and Swartz (2009) argued that "traditional conceptualizations of public diplomacy stress three dimensions, namely image cultivation, advocacy of national interests, and promotion of mutual understanding" (p. 382). In their work, they expand this to include global public goods. That is, they considered as an additional goal of public diplomacy, concerns that unite the world

such as global warming, global health risks (like the Ebola outbreak or Zika virus), and natural disasters (like earthquakes and tsunamis in Southeast Asia) which threaten everyone. They argue that this has led to a re-rationalizing of the goals of foreign policy and public diplomacy and has led to the emergence and need for public diplomatic organizations like the World Health Organization.

In this chapter, I have gone beyond this delineation of public diplomacy to bring together the myriad perspectives in diplomacy and public relations literature and attempt to form together a more thorough conceptualization of public diplomacy taking together scholarship in both fields. I started with a description of public diplomacy which challenges definitions of diplomacy currently found in the literature and proposes a clearer denominator of the characteristics of public diplomacy. After this, I tackled the question of who the publics of public diplomacy are and what the dimensions are.

As can be seen from the discussion on the delineation of publics, there are many different groups that are targeted in public diplomacy. So much so that perhaps there may be a need to speak instead of a "Publics' Diplomacy" to represent the full spectrum of efforts being made in this battle over hearts and minds. It is, as Nye writes, ultimately about the story that wins. Nye (2008) shows that, sometimes, the dynamics of the "publics" goes beyond influencing targets we are interested to a situation of inoculating publics against oppositional influences. He cites the example of efforts made by the Roosevelt-led administration (primarily through broadcasts) in reaction to the growing influence of Germany in Latin America in the 1930s to the early 1940s (Nye 2008, p. 97–98). Similar to this were the efforts by the United States and the Soviet Union targeting European opinion ahead of the Cold War.

Ultimately, what is needed for effective public diplomacy is a multifaceted approach which recognizes the different facets of diplomacy, the many types of publics, and the dimensions and looks to create a relationship that is peculiar to the dynamics of that interaction. I suggest that perhaps a further area of research will look at the diplomacy of unreached areas. Latin America and Canada have made the lead on this with efforts that take diplomats into local communities to interact with the people as part of their training. More studies will have to be conducted to provide empirical data and direction on the effectiveness of this as well as the Nigerian national youth service program.

Lessons on taking a multifaceted approach can be learnt from the revolutionary states of Qaddafi's Libyan Jamahiriya, Iranian public diplomacy under Khomeini, and the Bolsheviks and the Berne mission. They were able to build and grow in influence by properly crafting multifaceted public diplomacies that took into consideration the different publics and used the power of attraction and persuasion to achieve their aims. Although these outlaw regimes ultimately failed due to their unconventional goals (to euphemize it), there is much to be learnt from them on building a multifaceted approach to public diplomacy.

Any diplomatic mission that hopes to be successful will therefore need to have a complete understanding of what the new public diplomacy is – as opposed to the traditional. This mission will also recognize that there are very many players or actors in this diplomacy – thus, a publics' diplomacy – and, finally, a recognition that the dimensions of approach are equally many. It is only with a full comprehension of this can any diplomatic mission in the twenty-first century be successful.

# Public Employees and Motivation

Yongbeom Hur
Department of Government and Justice Studies, Appalachian State University, Boone, NC, USA

P

## Synonyms

Committed to work; Job satisfied; Stimulated to do work

## Definition of Motivation

Motivation is known to be driven by internal and/or external factors. When employees are motivated, they show higher interest in what they do and stronger commitment to their work, compared to non-motivated employees, and more likely to make efforts to achieve their goals and objectives.

## Introduction

Scholars and practitioners have searched for better ways to improve governmental performance, based on the general idea that bureaucratic organizations like governments are likely to experience more bureaupathologies, which refer to maladies and sicknesses of bureaucracy such as inflexibility, mediocrity, and suboptimization (Wilson 1967). Public bureaucracies tend to be negatively regarded, and public employees are usually blamed for their low performance and insensitive response to citizens' diverse demands.

One of the suggested approaches to dealing with bureaupathologies is to focus on the motivational level among public employees, given that motivation plays a critical role in producing better performance at work. Although researchers identified motivational bases and related factors for public employees, and verified positive effects of public employees' motivation level on their job performance, the majority of motivational theories have been developed in the private sector with samples of employees working in the private sector.

## Intrinsic and Extrinsic Motivation

Intrinsic motivation can be defined as taking actions or showing behaviors because of satisfaction or pleasurable challenge found in those actions or behaviors themselves, whereas actions are taken or behaviors are shown to get some external outcomes in extrinsic motivation cases. While extrinsic rewards and working conditions such as pay, benefits, and job security have been focused to increase the motivation level among employees in much research, some scholars have paid attention to intrinsic motivation such as achievement, recognition, and responsibility in boosting employees' motivation level (Herzberg et al. 1959). According to their findings, employees would be better motivated and productivity could increase as a result, when they experience those feelings at work, compared to when they are provided with better working conditions such as high pay and job security.

Many studies have attempted to measure the different effects between intrinsic and extrinsic motivations. Only mixed results were found particularly when public and private sector employees were compared. Compared to private managers, some found that public managers were better motivated by intrinsic rewards such as recognition and self-development opportunity than by extrinsic rewards such as pay and benefits (e.g., Khojasteh 1993). Others found that public employees were less motivated by some intrinsic rewards such as responsibility and self-development opportunity (e.g., Buelens and Van den Broeck 2007). Others also found no difference in motivational factors between public and private sector employees (e.g., Crewson 1997). While it is meaningful to examine the difference between public and private sector employees and to identify better motivating factors, this comparative approach has limitations as identified motivators work only relatively better, compared to the counterparts. For example, even though a factor better motivates public employees than private employees, public employees may not be significantly motivated by that factor because actual the motivating effect of that factor is not guaranteed. Khojasteh (1993) and Zhang et al. (2011) are among a few studies that have tested the effects of both intrinsic and extrinsic motivators in the public administration literature. These studies were conducted, based on the idea that public employees would be differently motivated because public organizations are different from for-profit organizations in many aspects.

## Job Satisfaction and Herzberg's Theory of Motivation

Job satisfaction is one of the major factors that can increase work motivation. If employees are more satisfied at work, they would be better motivated and could show higher work performance, all other things being equal. The need-based perspective on motivation explains how employees' job satisfaction can lead to their motivation. Wright (2001) explained that employees' satisfaction with types of rewards or working conditions

they receive identifies "necessary conditions for their optimal employee motivation." Therefore, if employees experience need deficiencies, compared to what they expect from their organizations, they may work less to regress to a balance between their contributions to an organization (e.g., efforts, time, loyalty) and their organization's provided inducements (e.g., pay, job security, benefits, career development) in a psychological contract between employees and their organizations (Rousseau 1989).

Given the limitations in providing monetary rewards to employees as an incentive in the public sector, Herzberg's two-factor theory of motivation may bring a great deal of benefits to public organizations if public employees can be successfully motivated when they experience such feelings as achievement, recognition, and responsibility at work. However, it is not certain whether or not public employees would be similarly motivated by a set of identified intrinsic motivators. Although Herzberg's theory has been tested in diverse contexts, most studies have been conducted with samples of private sector employees (e.g, Ewen et al. 1966).

Herzberg proposed the two-factor theory of motivation, arguing that both satisfaction and dissatisfaction do not belong to the same dimension (Herzberg et al. 1959). Instead, Herzberg argued that the opposite of satisfaction is not dissatisfaction, but no satisfaction. In other words, satisfaction and no satisfaction are located at the opposite ends of the same continuum. Likewise, the opposite of dissatisfaction is not satisfaction, but no dissatisfaction, and dissatisfaction and no dissatisfaction are located at the opposite ends of the same continuum. According to this theory, a set of factors that are related to the feeling of satisfaction are called "motivators." Additionally, a sect of factors, called "hygiene factors," are related to the feeling of dissatisfaction. Herzberg explained that motivators are connected to work itself such as recognition, responsibility, achievement, and self-development opportunity, whereas hygiene factors are related to working conditions and environments such as salary, benefits, interpersonal relationships, and company policies. Overall, Herzberg's motivators are associated with higher-order needs, while hygiene factors are more like lower-order needs in Maslow's need hierarchy (1954). For example, when employees are given secure job status, employees would not become satisfied. Instead, they would be only less dissatisfied because job security is one of the hygiene factors according to Herzberg's theory of motivation.

Although Herzberg's theory of motivation has been widely tested and applied in various motivational studies (e.g., Zhang et al. 2011), this theory has not been without criticism due to a fixed distinction between motivators and hygiene factors, regardless of differences in employees' personalities or job categories (e.g., Judge et al. 2002).

## Conclusion

While a wide range of ideas have been tried to make employees motivated mainly in for-profit organizations, enough attention has not been paid to public employees' motivation. As a result, it is not certain if public employees are motivated enough to achieve their goals and objective, as well as whether or not public employees can be similarly motivated by the motivators that are found in studies using private sector employees. Since it is known that better performance cannot be achieved without having motivated employees at work regardless of sectors, more motivational studies should be conducted with public employee samples in diverse contexts. Performance in public organizations would be greatly improved when major motivational factors for public employees are identified and actually applied, all other things being equal.

# Public Employees as a Strategic Resource

Linda J. Bilmes[1] and Jeffrey Neal[2]
[1]Harvard Kennedy School, Harvard University, Cambridge, MA, USA
[2]ICF, Fairfax, VA, USA

## Synonyms

Human capital; Human resources; People management

## Introduction

Throughout the world, public employees play a vital role in determining whether a city, region, or country is a good place to live, work, and raise a family. Quality of life – from ensuring pedestrian safety to national security – depends to a large extent on the skills and effectiveness of those who serve in the government workforce.

This entry argues that governments can strengthen performance by adopting forward-looking, "strategic human resources management" (SHRM). There is an extensive literature devoted to proving that SHRM is the key to success for many leading organizations. In the private sector, this work includes numerous studies demonstrating the link between investing in employees and achieving better financial outcomes. A small but growing body of evidence shows that public and nonprofit organizations can also achieve significant gains in performance by treating their employees as a strategic resource. However, to date, very few government institutions have adopted this approach.

## Employees as a Strategic Resource

There is a significant literature showing the link between investing in the strategic human resources capacity of the organization and organizational performance. This is hardly new. Michael Porter argued in his seminal work *Competitive Advantage* (1985) that managing human resources well is a critical ingredient in helping organizations achieve sustained competitive advantage. Jeffrey Pfeffer, in *Competitive Advantage Through People: Unleashing the Power of the Work Force* (1994) found that some of the most successful and creative companies had proactively adopted a strategy based on developing human capital.

"Strategic human resources management" (SHRM) has emerged as the design and implementation of "people" policies that foster long-term strategic benefits to the organization. Such practices may include recruitment and hiring, training, skills-mapping, compensation and benefits, promotion and retention plans, diversity and other programs, as well as enhancing the role of the HR function, altering organizational structure, and flattening hierarchies. More broadly, SHRM refers to creating an environment in which employees can help the organization to compete, innovate, and improve the bottom line – in short, to achieve long-term competitive advantage (Bilmes and Gould 2009; Delery and Shaw

2001; Ericksen and Dyer 2005; Huselid et al. 1997; Wetzker et al. 1998).

Over the past two decades, empirical studies have shown that organizations perform to the highest levels when they invest in their employees. Much of this work has sought to identify and measure the value of specific investments in human capital (Delery and Doty 1996). Mark Becker and Brian Huselid pioneered a series of efforts to quantify the extent to which human capital investments produce financial gains. Their research shows that a change of one standard deviation in an index of innovative human resources management practices increases a company's stock market value by $20,000 to $40,000 *per employee* (Becker and Huselid 1998). Huselid further showed that firms using SHRM reported increased sales per employee, increased market capitalization, and a decrease in employee turnover (Huselid 1995).

The global human resources consulting firm Watson Wyatt has been studying the relationship between financial performance and strategic human capital since 1999. The firm conducted a series of landmark studies of publicly traded companies demonstrating that better human resources practices lead to higher shareholder value. Across a database of some 750 companies in the United States, Canada, and Europe, Watson Wyatt found that the higher a company's "human capital index"(HCI) – a score based on the company's human resources practices, including pay, people development, communications, and staffing – the higher its shareholder value, regardless of economic and stock market conditions.

Watson Wyatt identified some 30 human resources practices that were associated with an increase in market value. Key practices included: increasing total rewards (e.g., health care, retirement, and benefit plans), linking pay to business strategy, giving employees a choice of benefits, creating a flexible workplace, strong recruiting and retention programs, open communications, effective use of HR technologies, promoting good employees, and retraining or terminating poor performers. Companies with the highest HCI scores averaged a 64 percent return to shareholders over 5 years, while those with medium HCI scores averaged a 39 percent return, and the lowest scoring firms averaged only a 20 percent return (Watson Wyatt 2001, 2005).

In *The People Factor: Strengthening America by Investing in Public Service*, Bilmes and Gould compared total shareholder returns over 8 years for hundreds of companies in Europe and the United States (Bilmes and Gould 2009). The authors ranked companies on a "people scorecard" according to the level of investment along two dimensions: employee compensation (including salary, benefits, transportation subsidies, vacation time); and "intrapreneurial" policies, which related to development of individual talent. The latter included training, development programs, opportunity for employees to participate in decision-making, and team and lateral placements within the firm. Across a wide range of industrial sectors, Bilmes and Gould found that the more "people-focused" companies achieved significantly better long-term financial returns than their peers. They also examined US government agencies that had adopted similar strategies and found that those organizations experienced similar improvement in performance.

The common thread across many studies is that organizations can successfully leverage SHRM to achieve better performance. While there is no single normative approach that fits in all cases, most SHRM efforts include at least four key elements:

1. Changing the organizational mind-set to regard employees as a strategic asset, rather than a cost.
2. Investing in the organization's labor force (training, education, personal development).
3. Empowering the HR function to play a strategic role (rather than simply a transactional role).
4. Linking and aligning the HR practices with the strategic goals of the organization.

Changing the organizational mind-set is a prerequisite to SHRM. Traditionally, organizations have regarded HR as an administrative support service that processes transactions. This limits

the role of "human resources" to a cost center, which is not directly linked to the bottom line. More profoundly, this view confuses the function of the HR *office* with the role of individuals in the organization. SHRM requires a philosophy in which employees are viewed as the most critical, valuable assets of the organization (Pfeffer 1998; Becker et al. 2001; Bilmes and Gould 2009). Using this mind-set, the organization needs to dedicate a great deal of time and effort to hiring the best people, motivating them to perform well, retaining and leveraging talent. This requires not just offering better benefits, but viewing the organization differently – as a place where the best assets walk out the door every night. Watson Wyatt noted that "The best performing companies did not simply have better-funded [human resources] programs; they had *entirely different programs* than the poorly performing companies" (Watson Wyatt 2001).

This philosophy dictates that an organization should invest in its human capital in ways that are linked to employee job satisfaction, loyalty, and performance. Many experts have found that such investment goes far beyond compensation and benefits, but includes more intangible factors such as providing employees with direct input into decisions that affect them, and creating opportunities for building skills, working in teams, and helping to solve problems (Bilmes and Gould 2009; Pfeffer 1994, 2010; Pfeffer and Sutton 2013).

The HR function needs to become a strategic partner. In a conventional organization where the HR office has played a purely transactional role, this may be challenging. HR culture must shift from an inflexible, risk averse culture to one that is more agile, innovative, and focused on the wider strategic goals of the organization. This requires a radical shift in the behavior, education, and mind-set of the HR team, as well as the rest of the organization (Becton and Schraeder 2009; Wetzker et al. 1998).

Finally, SHRM requires that the organization is aligned with rewarding and motivating its employees. An executive management Balanced Scorecard can be used as a tool to identify performance, goals, and targets and to link the reward and incentive structure for all personnel with the strategic goals of the organization (Pfeffer 2010).

## Strategic Human Resources in the Public Sector

The best-performing private sector companies embrace the philosophy that a satisfied, loyal workforce is a strategic asset and therefore investing in it makes good business sense. However, the majority of firms still do not put SHRM into practice. In their survey of 2000 workers at mid-size companies, Watson Wyatt's longitudinal studies show that many firms are adopting specific SHRM tools, rather than a full SHRM approach (Watson Wyatt 2001, 2005, 2011). Bilmes and Gould found that fewer than 20% of respondents were receiving the type of benefits and investment associated with SHRM (Bilmes and Gould 2009).

Despite evidence that SHRM can boost performance in government, the public sector lags significantly behind in the adoption of best practices (Berman et al. 2015). In certain countries, including Singapore, Canada, South Africa, India, and most of Western Europe, the civil service itself is highly esteemed and the process for entering is highly competitive. But even in those countries that focus on recruiting top applicants, few public sector organizations have taken steps to implement SHRM. Most public bureaucracies continue to be hierarchical and rule-driven and to perceive the HR function as a backwater. Elsewhere (including many emerging economies), efforts to improve the civil service have focused on professionalizing basic standards, rather than on introducing SHRM (Mutahaba 2010). In the United States, where the general public has a less favorable view of public employees overall, there have been dozens of efforts to reform and improve government performance. Yet here too, only a handful of government agencies have been able to implement SHRM.

Part of the challenge for implementing SHRM in government is that the culture of government agencies in the human resources areas is very different. Table 1 compares a "best practice"

**Public Employees as a Strategic Resource, Table 1** Comparison of SHRM company and traditional government agency

| SHRM best practice | Public sector organization |
|---|---|
| 1. Flexible culture | 1. Inflexible culture |
| 2. Generous HR benefits, highly flexible, wide range of benefits | 2. HR benefits inflexible; not competitive in some occupations |
| 3. Frequent training and skills development for all levels, especially managers; large departments and budgets dedicated to training | 3. Little training; sporadic; inconsistent across agencies, occupations and levels; low training budgets |
| 4. Pay linked to performance and benchmarked to competitors; often include stock options, bonuses linked to firm-wide performance | 4. Most pay fixed to classification system; limited experience with setting criteria for performance-based pay; no financial benefits if the agency performs well; bonuses often not related to performance |
| 5. Additional recognition for achievement; promotions and perks usually linked to achievement | 5. Few meaningful avenues of credit and recognition |
| 6. Innovation and risk taking rewarded; acceptance that sometimes a new idea will not work | 6. Innovation and risk taking discouraged; low tolerance for mistakes |
| 7. Flat organizational structure | 7. Hierarchical |
| 8. Detailed performance evaluation, with training for evaluators; long time-consuming process in which managers are required to do it properly | 8. Perfunctory performance evaluations in many agencies; little training of managers/ evaluators |
| 9. System accommodates individual needs and variety | 9. One size fits all; limited variety |
| 10. Philosophy that caring about employees makes good business sense | 10. Bureaucratic culture focused on mission, not employees |
| 11. Versatile workforce, some employees trained in multiple jobs | 11. Narrow job classification; stove piped workforce |
| 12. Career development aligned with long-term strategic planning; employees training linked to the long-term plans of the firm | 12. Little career development; decoupled from strategic plans; employees priorities often shift with change in elected government |

company using SHRM to a traditional public sector organization.

Despite these challenges, some government agencies have successfully implemented SHRM. The following case shows how the US Defense Logistics Agency, a public sector leader in this area, used SHRM to increase productivity, performance, and employee satisfaction. This example is helpful to understand the complexity of undertaking such change in a large public sector bureaucracy.

## Case Study: The US Defense Logistics Agency

The Defense Logistics Agency (DLA) is the US military's principal supply chain manager. Its 25,000, largely blue-collar employees in 48 US states and 27 countries provide the US armed forces with food, fuel, clothing, medical supplies, and spare parts. Although it is a government organization, DLA operates somewhat like a business, with a $35 billion annual budget derived primarily from sales of goods and services to the military. Over a period of 6 years, DLA implemented a full SHRM program to recruit, develop, and retain a world-class workforce. This included three main elements.

First, DLA elevated its Chief Human Resources Officer (HRO) to be one of five senior career civil service civilians in the DLA leadership team, with responsibility for all DLA HR strategy, operations and training. The agency consolidated all operations under the Chief HRO, who was empowered to devise and implement a comprehensive transformation of human capital practices.

One of his key innovations was to *separate* strategic HR planning and program development from operational HR. This change was driven by the recognition that day-to-day operations distracted HR professionals from focusing on longer-term objectives. The Chief HRO appointed a 12-person Strategic HR Program Development Team, which took the lead on redesigning the hiring process to support the mission. It set up a

new entry-level hiring program that grew from 40 participants in its first year to more than 900 five years later. The team also created a comprehensive multiyear leadership development program. It trained *every* new DLA supervisor, regardless of any training the new hire might have had in the past, and introduced survey and data analysis programs that included climate/culture, entry and exit surveys.

Second, the Chief HRO determined that an effective HR operation was the *sine qua non* of acceptance for HR as a strategic partner to agency leaders. He argued that if HR could not deliver on basic transactions and processes, it would lack credibility on the more complex HR issues. DLA reengineered many of its core HR processes to eliminate waste and strengthen its capacity to process traditional transactions. The result was a 28% reduction in costs and a 40% reduction in the length of time it took to fill job vacancies. Surveys showed significant increases in customer satisfaction and employee job satisfaction, with reduced absenteeism and job turnover (Bilmes and Gould 2009).

Third, the DLA's HR programs were refocused based on data, and on mission-driven needs. For example, when internal surveys showed that employees were dissatisfied with the leadership ability of managers, DLA instituted a rigorous training and credentialing program for all supervisors. It engaged the "customer" (other units of the US military) to provide input into DLA's strategic HR initiatives. This ensured that the resulting programs addressed customer needs rather than being inwardly focused.

The result was that DLA transformed its HR function from a generally disliked service provider into a key strategic partner in agency planning and operations. This meant, for example, that the HR office was asked to train 5000 employees as part of a $1 billion modernization program. Above all, the culture within the DLA was transformed into one where its workforce was viewed as a strategic asset.

The DLA example has several lessons for using SHRM in the public sector. First, DLA empowered an HR executive at the top of the organization to develop a different vision for human capital, which would harness the talents of its employees for the strategic benefit of the agency. DLA invested in a new hiring program and in widespread training supervisors and for the entire workforce. The agency also recognized that the key to enhancing the status and credibility of the HR function was to improve efficiency of core HR transactions. The combination of a strong HR leader, an efficient HR unit, the establishment of a dedicated strategic HR team, and the willingness of the agency to pursue a SHRM-based approach made it possible for the organization to transform its employees into a strategic resource. The HR function became a strategic advantage in hiring, developing, and retaining the talent the agency needs to thrive.

## Obstacles to Wider Use of SHRM in the Public Sector

More than one quarter of the global workforce is employed in the public sector (Hammouya 1999; Schumann 2014). This implies that the potential impact on global productivity from introducing SHRM is significant. Yet in practice, the DLA model has been difficult to replicate.

Any organization – public or private – faces challenges adopting SHRM. This include lack of commitment by senior management, shortage of relevant HR skills and know-how, and the absence of any widely accepted metric for measuring the bottom-line impact of SHRM (Pfeffer 1998; Phillips et al. 2001). The public sector presents an extra set of challenges.

The public service is embedded within a political system and subject to political influences. Decisions such as which government services to prioritize, privatize, downsize, or reorganize may be subject to influence by political actors. For example, Jarvalt (2012) showed that political economic and ideological factors played a major role in the development of the public service in CEE nations such as Poland, Slovakia, and Hungary.

Second, there is often a lack of institutional capacity. One of the prerequisites for introducing SHRM is that the mission of the government agencies is established within a legal framework and that there are basic norms and values such as fairness and accountability. In mature civil service

organizations (such as throughout the EU, United States, and Singapore), there is a long tradition of merit, impartiality, and stability. But in many emerging countries the process for hiring, promotion, job security, and payment of benefits does not meet these standards, with widespread problems of nepotism and corruption. The Africa Governance Forum which took place in Ouagadougou (Burkina Faso) in 2007 and the Roundtable Conference of the Africa Association for Public Administration and Management held in Ghana in 2008 focused on the need to strengthen the HR function in African countries in order to increase the institutional capacity of the states to meet their citizens' aspirations. The AAPAM conference called for competent, knowledgeable, well-motivated, and innovative human resources in the African public service. African human resource managers have established an African Public Sector Human Resource Managers' Network. However, to date these efforts remain in the early phases, and often underfunded (Mutahaba 2010).

Another factor that affects the public sector is the growing role of the private sector in delivering public services. Government at all levels is increasingly outsourcing to nonprofit and private sector providers and services are being delivered through "networks" of stakeholders (Goldsmith and Eggers 2004). In the United States, most levels of government, particularly the federal government, employ fewer people than it did 30 years ago, even though it provides services to a larger population. This complicates the HR challenge because control over HR policies and practices is indirect.

The challenge of measuring the overall impact of SHRM is especially pronounced in the public sector, where agencies have more diffuse goals than simply financial performance. In *The Human Resources Scorecard*, Jack Phillips, Ron Stone, and Patricia Phillips introduce a method for comparing return on investment in specific HR programs (e.g., reducing turnover rates) to the cost of the programs. Some of this work is directly relevant to the public sector. For example, Watson Wyatt found that organizations that fill positions quickly (in 2 weeks) outperformed those that take longer (around 7 weeks) by a large margin. This has implications for the US federal Government, where the average time to hire is 80 days. The DLA addressed this issue by developing its own proprietary metrics (based on its unique mission within the US military) and benchmarking itself against private sector firms that performed similar tasks.

Finally, government agencies must observe much higher levels of transparency than is typical in the private sector. More than 100 countries have "right-to-information" laws and other measures that enable legislators, media, and the public to have some access to decisions made by public sector employees. This environment fosters a risk-averse culture among government leaders, since they are always vulnerable to political leaders and the media shifting blame onto them for mistaken policies. Blaming public employees leads to poor morale in the workplace and undermines attempts to introduce SHRM by agency leaders.

## Conclusion

There is an enormous opportunity for Government agencies worldwide to benefit from investment in strategic human resources management. Both theory and practice demonstrate the large potential benefits in organizational efficiency and public service delivery from this approach. The quality of life of every citizen stands to benefit. Yet the obstacles to adoption in the public sector are significant. In order to overcome them, political leaders need to embrace SHRM as a key objective of public policy. The reward will be a more efficient and effective bureaucracy, greater accountability, and the ability of political leaders to implement their policies faster, more cheaply, and with a greater probability of success.

# Public Employees' Motivation to Learn and Develop in Greece

Evangelia Mylona and Dimitrios Mihail
Department of Business Administration, University of Macedonia, Thessaloniki, Greece

## Synonyms

Career development; Intrinsic motivation; Professional development; Training; Workforce development

## Definition

Motivation to learn and develop (MLD) refers not only to a specific desire of the trainee to learn the content of a training program but also how much employees participate in professional development.

## Introduction

In today's dynamic and turbulent environment, public sector reformers implement a set of private sector managerial tools, the so-called New Public Management (NPM). NPM emphasizes

on cost-savings, efficiency, and outcomes and hence adopts successful private sector personnel management systems so as to maximize the value of human resources and to create a highly motivated and properly skilled workforce, among others (Vermeeren 2017).

Motivational theories acknowledge the value of nonfinancial incentives, i.e., training, career development, coaching, and other employee-related policies. In financially distressed contexts where compensation per employee drops dramatically, managers inevitably shift their attention from monetary rewards to the intrinsic aspects of work. The present study focuses on one dimension of intrinsic motivation, namely, employees' motivation to learn and develop (MLD). MLD refers not only to a specific desire of the trainee to learn the content of a training program but also how much employees participate in professional development (Noe and Wilk 1993).

Since the financial downturn in the late 2000s in almost all OECD countries, the impact of budgetary constraints, restructuring programs, and the austerity measures has not been a subject of rigorous empirical scrutiny with regard to their effects on workplace behavior in public administration (Demmke 2017). In Greece, one of the first countries to experience budget cuts, the severity of the crisis forced public sector organizations to realize the significance of their workforce's development as a means of adapting to ongoing changes more effectively. Since government employees at all levels are continually asked to provide more effective and efficient services to meet new challenges, it is timely to examine employees' MLD in the Greek public sector which has been severely impacted by the debt crisis.

Although the Memorandum austerity measures imposed since May 2010 caused major structural reforms in the Greek public sector, it still remains the largest organization complex system, characterized as unique and problematic. Greek public servants face the challenge of managing and tolerating the augmented workload because of government downsizing. As cost-saving measures were higher in the state than in the private sector, maintaining or even improving the effectiveness and efficiency of public service to meet new public demands has become a critical issue. In order to maximize employee performance, training and development programs are the major tools that organizations use to enhance organizational human capital competences (Zahra et al. 2014).

Research on employee training and development, with regard to private sector business and industry, has put forward the significance of interactions between managers and employees by utilizing the theoretical framework of the social exchange theory. According to the social exchange theory (Blau 1964), employers and employees develop an exchange relationship. In general, one will try to recompense those that provided help and benefits. In line with this notion, previous scholars identified the significant role of perceived supervisor support (PSS) on MLD and employees' positive outcomes in the private sector. PSS is defined as employees' views concerning the degree to which their immediate line manager values their contributions and cares about their well-being (Kottke and Sharafinski 1988). As it has been empirically shown, when supervisors serve as enablers of employees' training and development opportunities, PSS has a positive effect on employees' MLD (Towler et al. 2014).

Surprisingly, the literature of human resource management (HRM) in the public sector has neglected to explore the importance of the aforementioned relationship between managers and employees and the explanatory power of the social exchange theory. In addition, since the reciprocity norm initiates when the organization provides a supportive and caring atmosphere for employees (Eisenberger et al. 2002), such that employees reciprocate by feeling attached and committed to the organization and by acting to achieve organizational goals, previous studies have neglected to explore the role of perceived organizational support (POS) and organizational commitment in the relationship between PSS and employees' MLD.

This study aims to fill these gaps by providing a comprehensive approach of employees' perceptions regarding supportive conditions.

For this reason, the current research posits that the relationship between PSS and MLD is subject to POS and organizational commitment. Employees are expected to respond differently to the support offered by the supervisor, depending on their perception of organizational support (Simosi 2012). For instance, low levels of POS may be considered by employees as an unwillingness or incapability on the part of the organization to support their efforts, despite the supportive intentions of the immediate supervisor. Hence, employees may become confused about the consequences of such an organizational orientation or view it with disdain. This study also shows that in a supportive working environment, personnel's MLD is prompted by employees' positive attitudes, i.e., affective and normative commitment. As employees perceive the provision of supervisors' support as recognition of their contribution, then this supportive stance triggers a social exchange process in which employees feel both committed and obligated to reciprocate to the organization (Bashir and Long 2015).

## Perceived Supervisor Support as an Antecedent of Employees' Motivation to Learn and Develop

The concept of PSS reflects the exchanges between supervisors and employees, and it is indicated that when supervisors act as sources of support, then employees are more likely to reciprocate with positive job attitudes and work behaviors. Specifically, regarding training and development, the role of supervisors often involves "encouraging and motivating employees to attend training programs, helping employees before, during and after training programs in terms of time, budgetary support and resources, getting employees to be actively involved in decision-making, and guiding trainees in applying the new competencies that they have acquired in their workplace" (Towler et al. 2014).

Supervisors can send clear signals regarding the role and value of training, development, and professional growth in the firm, which may, in turn, motivate employee behavior regarding development activities.

## The Role of POS in the Relationship Between PSS and MLD

Another form of social exchange relationship that captured researchers' attention is POS. Eisenberger et al. (1986) defined POS as the extent to which the organization values employees' contributions and cares about their well-being. Previous research on POS has demonstrated that employees interpret organizational actions such as supportive HRM practices as indicative of the personified organization's commitment to them.

Early studies indicated that POS and PSS are two distinct forms of social exchange. Accordingly, Simosi (2012) argued that given the unique exchange relationships employees hold with various organizational entities, it is possible for someone to experience a high level of support with one entity (e.g., organization) while at the same time to experience low level of support with another entity (e.g., supervisor).

When the immediate line manager is supportive, values employees' contribution, and cares about their well-being, then employees are more likely to participate in training and development programs. Nonetheless, past theoretical models have often overlooked how, why, and in which organizational contexts this relationship is established. Hence, this study claims that the strength of the relationship between PSS and MLD rests on employees' perceptions of organizational support. PSS is likely to become more influential when employees are within a supportive environment at an organizational level. Within this context, managers not only are willing to but also are able to fully apply beneficial HRM practices, such as employees' participation in work decisions and employees' participation in training and development programs. On the other hand, the supervisor's support is likely to become less influential when employees perceive that their work organization constitutes an unsupportive environment (Simosi 2012).

## The Role of Organizational Commitment in the Relationship Between Employees' Motivation to Learn and Develop and Supervisors' Support

Organizational commitment is considered one of the most important notions in the field of

organizational behavior and HRM. Meyer and Allen (1991) proposed that commitment is multidimensional and that a distinction should be made between the three components of commitment: affective, continuance, and normative. Affective and normative commitments have been investigated in this study, since both dimensions of commitment are developed through reciprocity norms and influenced by perceptions of mutual obligations.

### Affective Commitment

Affective commitment is defined as the relative strength of an individual's identification with, and involvement in, a particular organization. Employees with strong affective commitment remain in the organization because they want to (Meyer and Allen 1991). Pioneers of organizational commitment (Meyer and Allen 1991) identified employees' work experiences as the most influential antecedents of affective commitment and suggested that commitment develops as the result of experiences that satisfy employees' needs and/or are compatible with their values. In particular, it is showed that HRM practices which satisfy employees' need to feel comfortable in the organization and be competent in the work role are expected to positively and strongly affect employees' level of affective commitment.

Since the immediate line manager serves as the deliverer or implementer of the HRM practices that bring HR policies to life (Purcell and Hutchinson 2007), previous research has demonstrated the significant role of supervisors in the implementation of HRM practices. Hence, employees' level of PSS affects important organizational and individual outcomes such as performance, job satisfaction, turnover intentions, and organizational commitment, while antecedents of PSS include the provision of challenging tasks, feedback, and training. Specifically, focusing on organizational commitment, recent studies revealed that supervisor support has a significant positive influence on affective commitment.

Yet few organizational scholars have explored the relationship between affective commitment and employees' MLD. Findings confirmed a positive relationship between the examined variables.

Based on the above findings, it is suggested that when the immediate supervisors act as facilitators of support (increased PSS), then employees are more likely to develop strong affective commitment. Furthermore, in such a supportive environment, committed employees are anticipated to reciprocate by willingly participating in training and development programs.

### Normative Commitment

Normative commitment is the least studied component of organizational commitment and reflects a feeling of obligation to continue employment. Employees with strong normative commitment remain in the organization because they feel they ought to do so (Meyer and Allen 1991). Initially, antecedents of normative commitment were based on Wiener's (1982) study on socialization experiences. According to Wiener, socialization experiences create within the employee a sense of obligation to remain in the organization. These socialization experiences may be both prior to (familial/cultural socialization) and following (organizational/socialization) the entry into the organization. However, the revised measures of normative commitment allow the possibility the receipt of benefits (e.g., job training, compensation, and rewards) and the recognition of these investments to create a feeling of obligation to reciprocate.

The relationship between organizational support and normative commitment has attracted researchers' attention since there is a "possibility that reciprocation is based on employee's felt obligation to care about the organization's welfare" (Simosi 2012). It is suggested that the levels of normative commitment improved when organizations provided support for continuous learning and normative commitment was strongest for those who valued the continuous learning they received while managing their own careers.

Furthermore, there is no evidence on the relationship between normative commitment and motivation to learn. Previous literature neglected to explore whether employees with high normative commitment are also highly motivated to participate in training and development programs. In this study, it is argued that employees, who believe that they ought to continue employment,

are also anticipated to have a sense of moral obligation to reciprocate by participating in training and development activities. By doing so, not only do they intend to improve their performance and service delivery so as to repay supportive actions, but they also seek to feel confident in their work by acquiring new skills, knowledge, and abilities.

Building on the preceding discussion, it is suggested that when the immediate supervisors act as facilitators of support (increased PSS), then employees are more likely to reciprocate with normative commitment and hence are more willing to participate in training and development programs.

## Conclusion

NPM in the public administration seeks to react to current challenges, such as callsfor more efficient and cost-effective public services, through employee training and development policies. This study responds to the call for additional research concerning the effects of training and development on public sector employees' behavior in a context of budgetary constraints.

Findings validate previous research conducted in the private sector and demonstrate that the strong positive relationship between PSS and MLD is also applicable to the public sector. Nevertheless, prior studies, conducted in both the private and the public sector, have neglected to explore the factors that mediate/moderate this relationship. For this reason, this research further considered organizational-level factors, i.e., POS. This is in line with recent calls to overcome the prevailing and rather narrow conceptualization that managers are the sole influencers of employees' outcomes. It is found that the strength of the relationship between PSS and MLD rests on employees' perceptions of organizational support. In other words, supervisor support is likely to become less influential when employees perceive that their work organization constitutes an unsupportive environment as a result of prescribed and limited budgets as developed by the organization.

Next, this study explored the mechanisms that mediate the positive relationship between supervisors' support and employees' MLD. Since the concept of PSS reflects the exchanges between supervisors and subordinates due to the positive interactions built on commitment and trust, this research explored the mediating role of organizational commitment. It is found that employees who either want to (affective commitment) or ought to (normative commitment) continue employment are also anticipated to willingly participate in training and development activities. As employees perceive the provision of supervisors' support as recognition of their contribution, then this supportive stance triggers a social exchange process in which employees feel both committed and obligated to reciprocate to the organization.

Apart from the above theoretical contributions, the current study also provides important practical implications. Managers, as the first guarantors of the NPM procedures, play a vital role in the successful implementation of HR development practices. As line managers have the power within their organizations to approve or deny training, development organizations should be more selective when promoting or recruiting line manager positions and look for candidates with genuine interest in people rather than solely technical expertise (Kuvaas and Dysvik 2010).

Nevertheless, more importantly, findings suggest that public employees' development opportunities should be supported by both supervisors and the organization. Managers' words and promises, relating to training and development practices, should be congruent with the organizational policies and actions. Hence, the organization's strategic employee development plan should be effectively communicated and implemented by line managers. Accordingly, financially distressed public organizations should avoid cutting the training budgets as such an action not only would seem shortsighted but would also signal to employees the lack of organizational support, and this, in turn, would hinder managers' supportive actions.

Additionally, this study argues that in times of financial turbulence, and limited monetary

motivators, nonfinancial rewards are vital. Nevertheless, in order to enhance employees' motivation to learn and develop, public administration should acknowledge the important role of employees' organizational commitment. Enhancing employees' commitment through supportive actions (both organizational and managerial), such as recognition, communication, and fairness, triggers a social exchange mechanism. In such a supportive environment, despite the financially unfavorable conditions and limited monetary incentives, committed employees are anticipated to reciprocate by willingly participating in training and development programs.

# Public Employment and Representative Bureaucracy

Kuan Heong Woo
School of Social Sciences, Universiti Sains Malaysia, Pulau Pinang, Malaysia

P

## Synonyms

Government jobs; Public sector careers; Public sector recruitment; Representative civil service; Representative government

## Definition

Public employment refers to employment by the state or government or the public sector;

Representative bureaucracy refers to a form of representation which reflects or captures almost

all aspects of the demographic compositions in the governing body of the state.

## Introduction

Public employment generally refers to employment by the state or government bodies at the federal, state, or local level and also by government statutory authorities. Employees being recruited into the public sector are paid directly by the government to perform public service and carry out activities of the government to achieve its goals. In a modern society, the functions of the public sector penetrate almost all aspects of social life. Considering the far-reaching implications that public employment holds for economic health and other aspects of daily life, it is understandable that the processes controlling entry and employment to these jobs are subject to widespread concern.

Representative bureaucracy is essential in a democracy. Traditionally, representative bureaucracy refers to the relationship between the demographic makeups of the public sector workforce in a society that the state is governing. To use Krislov's (2015) terms, representative bureaucracy is the notion that "broad social groups should have spokesman and officeholders in administrative as well as political positions" (p. 23) and this notion captures almost all and every aspect of population in a society that the bureaucracy supposed to serve.

The purpose of this entry is to provide an understanding of the importance of representative bureaucracy in modern democracies. This entry demonstrates the relationships between public employment and the representativeness of the bureaucracy, and representative bureaucracy and the performance of the civil service in the Malaysian context. It contains four sections. Next section discusses the theory of representative bureaucracy and its importance. The third section concerns the Malaysian civil service and its representativeness in terms of ethnicity. It also examines how (the lack of) representative bureaucracy in the Malaysian civil service impacts the performance of the government. The final section is a concluding discussion of the topics covered in this entry.

## Theoretical Perspectives: Representative Bureaucracy and Its Importance

Representative bureaucracy was first articulated by J. Donald Kingsley in 1944. The theory growth at a time when there was worry over unelected public officials or civil servants occupying significant and crucial government positions. These unelected public officials have considerable discretionary power in performing governmental policies and programs which passed on to them by elected representatives. Theories of bureaucratic politics suggest that bureaucracies and bureaucrats routinely engage in political behavior. Up to a certain degree, the discretionary power civil servants possess allowed them to control resources and determine its allocation – a process of deciding *who gets what, when, and how*, the standard definition of politics as proposed by Harold D. Lasswell. The politics of representative bureaucracy also underlines the procedural, political, and conflictual nature of representation in public agencies. With the emerging political and normative consideration following the discourse of political identity, focusing on bureaucracies as representative institutions is no longer only contingent on functional necessities or political opportunistic behavior but also as a manifestation of minority rights (Peters et al. 2015). Therefore, representation in bureaucracy is a major concern in the study and practice of public administration and administrative policy making in modern democracies.

In modern politics, it is argued that representation is necessary in relation between legitimacy and democracy. "In the course of communication and cooperation," Moscovici (2000) contends, "individual and groups create representation" (p. 27). Social representation concerns systems of values, ideas, customs, beliefs, and practices that shared between members in a society. The essentiality of legitimacy in a government made social representation an important and fundamental condition for every government, especially

government in plural society. These are issues of social equity and inclusiveness. In order to ensure responsiveness in a diverse society, sufficient social representations and hence a representative bureaucracy are important.

Bureaucrats are not directly accountable to the people in a democracy; however, they have huge amount of discretionary power within the broad policy parameters and this is exactly the part where the incongruity between democratic principles and implementation occurred. With the discretionary power, choices bureaucrats made would have great impact on governmental decisions. Due to the powerful role collectively played by civil servants and "the degree to which all democratic institutions are representative is a matter of prime significance" (Kingsley 1944, pp. 282–283), scholars and practitioners have actively advocated the essentiality of representative bureaucracy. It is argued that at the minimum, the government administrative and governing structure should recognize the diversity of its people. Representative bureaucracy theory is especially relevant in connection with the changing and increased roles and enhancement of power of professionalized bureaucrats in the policy process with the growth of the bureaucracy in terms of size and complexity over time.

Since Kingsley, the theory of representative bureaucracy has been significantly advanced by Mosher (2015) with differentiating between passive representation and active representation. Passive representation refers to mere presence of bureaucrats that reflects the demographic of the total society. It concerns the source of origin of individuals and may be statistically measured in terms of locality of origins, education, family income, race, gender, religion, and other social background. It is said that a passively representative bureaucracy has symbolic importance. According to Mosher (2015), "the leadership personnel of a public service, which is broadly representative of all categories of the population . . ., may be thought of as satisfying Lincoln's prescription of government 'by the people' in a limited sense" (p. 20). As for active representation, it refers to individuals press for the interests and desires of those whom she/he is presumed to represent. More specifically, active representation takes the assertion that bureaucrats in a bureaucracy will be acting in a way that increase substantive benefits for their social groups. However, Mosher (2015) warns that if "active representativeness run rampant within a bureaucracy would constitute a major threat to orderly democratic government" because "the summing up of the multitude of special interests seeking effective representation does not constitute the general interest" (p. 20).

Whether passive representation or active representation leads to substantial benefits for social groups is still a matter of discourse (Lim 2006). However, scholars agree that the linkage between passive and active representation is established, and active representation is exists within public administration. It is said that the norms and values of an individual (bureaucrat) would have impact on behavior and policy outcome; hence, the idea of representative bureaucracy is seen as a means of insuring administrative responsibility (Meier and Steward 1992; Saltzstein 1979).

In sum, representation in the bureaucracy not only has symbolic but also substantive effects for all communities in a society. The theory of representative bureaucracy suggests that the civil service deserves attention because civil servants played important roles in influencing the actual course and effects of government policy through their advice to elected representatives (ministers) and policy implementation. Therefore, having a representative bureaucracy is essential for securing equitable responsiveness to all social groups, ensuring the performance of the civil service, safeguarding power sharing among communal sections, and enhancing legitimacy of the government. The theory of representative bureaucracy also advances our understanding of the balance of power between the politics and administration of a state.

## The Malaysian Public Employment and Representative Bureaucracy

### The Malaysian Public Employment

The Malaysia Civil Service inherited its legacy from the British Public Service which is formerly

known as the Malayan Civil Service. The establishment of the civil service could be traced back to the late 1700s when the British East India Company acquired Penang. The Malaysian civil service has undergone significant fundamental changes over the last 60 years since independence. With the twin objectives of poverty eradication and economic restructuring, the introduction of the New Economic Policy (NEP) in 1970 after the race-based violence on 13 May 1969 marked a sharp increase in the restructuring role of the Malaysian government. The Malaysian civil service is the target and also the main instrument for implementing the NEP. The personnel in the public sector have greatly increased with the government's expanded role, and the Malaysian government is the major employer in the country since the implementation of NEP until today. With the start of NEP, the country witnessed the swift growth of the civil service in terms of size where the numbers of civil servant have accounted for over 10% of the country's labor force (employed persons) and for about 4% of the country's population since 1990. In January 2016, the number of civil servants stood at 1.6 million. The amount of critics on the bloated civil service has never been dwindled; however, Putrajaya, the federal administrative center of Malaysia, defended the big size criticism (Zahiid 2013).

Public employment in Malaysia is widely perceived as mainly to have attracted applicants from graduates of local public universities and some of foreign universities but apparently hardly any from graduates of private universities in the country. What worth noting is that since the implementation of NEP, the racial composition in public higher education institutions has become, and continuously until today to be, predominant by Malay/*bumiputra* and vice versa for private higher education institutions. However, studies on attractiveness of the Malaysian public employment demonstrate that the civil service faces no difficulty in attracting a sufficient number of applicants from all ethnic and gender groups to secure a capable and representative bureaucracy (Woo 2017); this hence raises the question: why the increasingly mono-ethnic civil service since it is able to attract enough applicants to secure a representative civil service?

## Representative Bureaucracy in the Malaysian Civil Service

Malaysia is a multiethnic country. The country's population was 30,751,602 in 2016, making it the 44th most populated country in the world. The multiethnic country consists of three major ethnic groups, namely Malay, Chinese, and Indian. As of July 2016, the population of Malaysia consists of 68.6% natives (mainly Malay), 23.4% Chinese, 7.0% Indian, and 1.0% others.

Representative bureaucracy was not a consideration of the British colonial government when the colonial government first introduced the civil service in Malaya. Nonetheless, today, representations in the bureaucracy have been an issue of concern in the country. Preference for Malays in recruitment and promotion is common knowledge in the public sector. According to a former Chief Secretary to the Government, the Malaysian public employment and public education are widely perceived as the "birthright" of Malays because "they are the indigenous and the ones with the only right over it" (Hassan 2010, pp. 40–41). Nonetheless, minorities in Malaysia today also identify themselves with the country of their birth. Like other indigenous, new generations of Chinese and Indian ethnicities who are born in Malaysia do not see China or India as their homeland, and they consider themselves equally indigenous as Malay and other natives.

Discrimination in public employment has long been the focus of concern among non-Malay groups in the country. The belief of equal treatments in terms of recruitment and promotion are not given to all regardless of racial groups is prevalent among non-Malay groups. Even though officially public personnel recruitment policy in Malaysia is color-blind, in practice, due to a lack of cross-ethnic understanding and empathy, many Malay public officials who have discretionary power in selecting and appointing tend to bias recruitment decisions in favor of their own ethnic group, and this is evidenced by recently released data of public service recruitment. Released data on public service recruitment show that the total

numbers of appointed civil servant of all ethnic groups have increased from 2011 to 2012. However, the percentage increases of appointed non-Malay civil servants were still lower than that of the appointed Malay civil servants. The lowest increase, of merely 11%, was for Chinese civil servants, while the percentage of Indian civil servants increased 49% compared to the increase of 59% Malay civil servants joining the civil service (The Appointment 2013). The NEP restructuring since 1970 has resulted in a Malay-dominated civil service and the abovementioned kind of recruitment practice exacerbated the unrepresentativeness of the civil service. As a result, at the end of 2014, the civil service only consists of 5.2% Chinese, 4.1% Indians, 0.7% others, and 11.2% other natives compared to 78.8% Malays (FMT Reporters 2015). These ethnic breakdowns in the civil service are far from reflecting the population breakdowns in terms of ethnic as discussed in earlier part.

Perception guides action. The belief of discrimination against minority groups in public employment would probably have chilling effect upon minority groups – an effect where it tends to keep people from seeking employment and advancement in an organization even in the absence of formal bars. This probably provides some explanation for the low application rates to the Malaysian public employment among non-Malay compared to Malay groups.

In short, while the Malaysian civil service expanded rapidly in terms of size since the start of NEP, recruitment into the public sector continued to be predominantly Malay and this has led to the increasingly mono-ethnic civil service.

### Performance of the Malaysian Civil Service

Due to the large size and scope of the civil service, it is understandable that its employment and performance is of major concern to citizens and other stakeholders. When studies show that public employment in Malaysia is attractive enough for all ethnic groups in the country, state employment continues to be along ethnic lines and political motivated. When defending itself against the large size criticism, the government made no pretense that it is providing employment opportunities to Malaysians (Zahiid 2013), indicating the government's plan to trim the number of civil services never really took off for political reasons. Thousands of graduates from local universities, many of who lacked basic skills, have been quietly absorbed into the civil service, and according to Chin (2011), the move was spearheaded by United Malays National Organization (UMNO) – Malaysia's largest political party and the core of the ruling parties – as almost these graduates were ethnic Malays, UMNO's core constituency. This directly raises the issue of the quality of public human resources and hence the performance of the civil service.

The quality of personnel has direct effects on performance. As early as 1972, Esman (1972) had pointed out that Malaysia paid a price in reduced administrative effectiveness because many talented non-Malay people were being denied to administrative careers. Many worry and believe that the Malaysian bureaucracy is filled with *second-raters* or worse and this worry has been echoed by many Malaysian leaders, including organizational/political party leaders, ministers, and (former and current) prime ministers of Malaysia.

The public often regards corruption and unsatisfactory service delivery as significant performance deficits of the civil service. Government corruption has long been seen as worrisome. According to both rank and score in Transparency International's Corruption Perception Index, little improvement has been made in political and bureaucratic corruption in Malaysia since 1995. The perception of government corruption is worsened in 2016 when the United States Department of Justice (DOJ) filed proceedings under the US Kleptocracy Assets Recovery Initiative 2010 (KARI) to recover assets associated with a fund owned by the Malaysian government that raised nearly $8 billion to benefit the Malaysian people which has been embezzled from the Malaysian people by high-ranking fund officials and their associates instead. According to the president of Transparency International Malaysia, Akhbar Satar, "A government practices cronyism and nepotism by awarding prime contracts and civil service posts to relatives or personal friends rather

than giving them to competent candidates; it creates projects at policy level with the main reason being to funnel money out of the treasury to itself or its cronies, with little viability or necessity of the projects" (FMT Reporter 2016). This probably partly explained the reason behind the high ranking of Malaysia on the index of crony capitalism ranking in 2016 – Malaysia ranked the second, just behind Russia (Comparing Crony Capitalism around the World 2016). The perceived high level of corruption carries negative implications for the integrity and accountability in public institutions. It is said that a high level of accountability "is still very much lacking" in Malaysia and that the lack of accountability in the government was the factor behind the political and regulatory environment's score in Malaysia falling from 59% in 2014 to 48% in 2016 as reported in the Asian Corporate Governance Association (ACGA) report (Toh 2017, p.5). The above situation and perception very likely would continue to adversely impact Malaysia.

In terms of service delivery, the civil service's flaws and errors could be easily found in the Malaysian auditor-general's (AG) reports. The AG reports have repeatedly revealed and highlighted civil servants' wasteful expenditure, unauthorized expenditure, nonrecovery of advances, irregular payments, unretired imprest, misapplication of funds, and others, which embarrassed the government annually. Financial mismanagement by civil servants has resulted in excessive financial leakages. Every year, the AG report has been highlighting a set of same noncompliance patterns in various government's ministries and departments, which continues to attract media and public attention. In general, weaknesses that were identified in AG reports revolve around delay in completion of projects, poor quality of construction works, monitoring and auditing not conducted comprehensively, discrepancy in payments collection, no standard operating procedures, and others. The troubling fact is even the lowest levels of government have been seeped with corruption, wastage, and negligence. However, contradictory to the public expectation to hold those involved accountable, thus far, no serious effort has been taken to address the noncompliance issues involving civil servants. More seriously, doubts have been raised about the knowledge and ability of senior civil servants and the top management of the government in handling unexpected incidents or crises. Also, in the Malaysian multiethnic context, equitable responsiveness to all ethnic groups is an important criterion of civil service performance. The perceived lack of responsiveness to underrepresented groups has raised concern over the shortage of non-Malays in the civil service (Woo 2017).

Racial preference compromises merit criteria and capacity and hence the performance of the civil service. And the compromise of merit in personnel practices continues to exact a nontrivial price in terms of effectiveness and efficiency of the civil service. Scholars contend that the poor capacity of the education system to foster well-equipped graduates contributed to *institutional decline*, which involve public sector institutions. Since employment in the public sector was along ethnic lines, based on quotas not meritocracy, this has contributed to the poor quality of the public delivery system (Gomez et al. 2013). There exists a vicious cycle: *declined institution* (poor capacity of education institutions) produces poor human resource, which is likely to be absorbed into various public institutions (for political reasons), and poor human resources in the public sector are likely to produce poor performance, which in turn leads to further institutional decline.

## Conclusion

Public employment involves working for any federal, state, and local agency and it is funded through taxpayer money. Unlike private sector employment where its impact normally will not go beyond a firm or an organization, public sector employment holds great impact not only for economic health, opportunity in policy participation, but also would affect power sharing among social groups, political stability, and hence the quality of democracy of a country. Therefore, it is intelligible that the processes controlling entry and

employment to public sector jobs are subject to widespread concern, in a plural society especially.

Representative bureaucracy is essential in modern democracies. Democracy is equated with equal opportunities to all social groups to participate within democratic processes. As suggested by Mosher (2015), while representative bureaucracy (passive representation) is no guarantor of democratic decision-making, it carries some independent and symbolic values that are significant for a democratic society. In line with this perspective, the theory of representative bureaucracy is a theory that focuses on finding a way to legitimate the bureaucracy's political power in the context of democratic value and provides insight into the balance of power within the politico-administrative axis.

The civil service is an institution entrusted with supporting the development and delivery of government programs in distributing precious resources to various social groups. In other words, civil servants, higher ranking public managers especially, have control over factors of production and distribution of benefits. To ensure all social groups have equal access and control over these resources, a sufficiently representative bureaucracy is important. The central tenet of the theory of representative bureaucracy is that a bureaucracy reflecting the diversity of the society it serves is more likely to respond to the interests of all social groups in decision and policy making.

Although democracy has become a truly universal value and pursuit, the widespread rhetorical commitment to the principles of social equality in public employment does not automatically translate into practice. As suggested by Krislov (2015), fundamental to the question are the modes of recruitment that employed by a government. In general, public sector recruitment seems close to necessary condition for representativeness of the civil service institution. As evidenced by the case of Malaysia, public sector recruitment practice employed played a major role in affecting the representativeness of its civil service institution. And it is also demonstrated in the case of Malaysia, a representative bureaucracy has great impact on the performance of the government.

# Public Employment During Budget Crises

Yu Shi
Department of Public Administration,
University of North Texas,
Denton, TX, USA

## Synonyms

Budget crises; Economic recession; Fiscal crises

## Definition

The US Census of Government defines public sector full-time employees as those persons whose work hours represent full-time employment with their employing government.

## Introduction

State fiscal stress and budget deficits have been recurring problems over the past 30 years. In December of 2008, the National Bureau of Economic Research officially declared that the United States was in an economic recession after a 6-year period of economic expansion that began in November of 2001. Unlike prior economic recessions, the Great Recession of 2008–2009 severely strained state budgets starting in fiscal year 2009 and is likely to influence state governments' short-term financial health and long-term economic outlook. Given the severity of the Great Recession of 2008 and the balanced budget requirements that nearly all states face, almost every state needed to pursue certain strategies to cover fiscal deficits, balance the budget, and reduce fiscal stress. These strategies could be responses from state and local governments in terms of revenue increase or expenditure/service reduction.

Because the majority of public spending is for personnel, it is not surprising that states employ some personnel-related strategies to reduce expenditure. Figure 1 shows that the total amount of public sector full-time equivalent employment at the state level fell in 2009 and continued to decline in the subsequent 3 years. State governments adjusted the levels of public sector employment when they encountered losses in revenues or faced reductions in financial aid or higher levels of long-term liabilities.

This entry chapter in the *Global Encyclopedia of Public Administration, Public Policy, and Governance* has three goals. First, it aims to introduce the background of state fiscal crises during and after the Great Recession of 2008–2009. Second, it discusses certain theoretical and empirical budget-balancing approaches used by state and local governments to deal with budget crises. Third, this essay has the purpose to show how public sector employment changes as a response to the most recent and severe economic recession of 2008–2009. By pursuing these goals, this essay aims to help practitioners who are interested in the choices of fiscal policies to understand the fiscal behaviors of state and local governments and to improve their policy-making and policy implementation over time. It also provides scholars some knowledge regarding the impact of budget crises on public personnel management.

## Background: State Fiscal Crises During and After the Great Recession of 2008–2009

The Great Recession of 2008–2009 was very severe and affected almost every state. Table 1

**Public Employment During Budget Crises, Fig. 1** Number of public sector full-time equivalent employees across states, 2002–2012. (Data source: Author's calculation by using the data from the Census of Government)

**Public Employment During Budget Crises, Table 1** State budget gap, fiscal years from 2009 to 2013 (current dollar amount in billions)

| Fiscal years | Number of states having to close budget gaps | Amount of budget gap that each state has to close on average | Total fiscal year budget gap |
|---|---|---|---|
| 2009 | 46 | 2.4 | 110 |
| 2010 | 49 | 3.9 | 191 |
| 2011 | 47 | 2.8 | 133 |
| 2012 | 43 | 2.6 | 108 |
| 2013 | 31 | 1.9 | 55 |

Data source: Oliff et al. (2012)

shows that most states were faced with the task of addressing large budget shortfalls that reached billions of US dollars. According to the data from the Center on Budget and Policy Priorities (Oliff et al. 2012), the average budget shortfall for each state reached a historical high of approximately $3.9 billion. The Great Recession of 2008–2009 generated a multi-year cumulative budget crisis for almost every state. States faced the major fiscal challenge of balancing their budgets, followed by a period of slow fiscal recovery after 2009.

By historical standards, the magnitude of financial collapse and the degree of state fiscal deterioration were disproportionately large compared to the severity of previous economic recessions. The largest previous budget shortfall resulting from the recession of 2002 totaled $80 billion in 2004. However, by 2010, the budget shortfall had reached $191 billion (Oliff et al. 2012).

On February 17, 2009, the US Congress approved the American Recovery and Reinvestment Act of 2009 to help the economy recover from the Great Recession of 2008–2009 by preserving and creating jobs and promoting economic recovery. Although the economy slowly recovered and the federal government provided additional assistance to state governments, most states faced continuing fiscal challenges and employed various strategies to alleviate their financial problems.

## State Responses to Their Fiscal Crises

Several major theoretical approaches have been written about the behavior of state and local governments in fiscal crises and the conflicting alleviation strategies they may pursue. Classic cutback management theories derived from the work of Levine (1978) explain how governments manage their budgets given

constrained organizational resources and how they respond to fiscal stress in a systematic way. In his seminal work of "organizational decline and cutback management," Levine (1978) argues that choices of cutback management strategies for government organizations in the fiscal retrenchment periods depend on the degree and persistence of resource declines. According to Levine's (1978) step-by-step approach, state and local governments will first pursue options that are easiest to implement, least visible to the public, and least intrusive to operation and financing (Levine 1978).

The second coping strategies approach is similar to Levine's (1978) but one that highlights a hierarchal set of responses to fiscal stress (Wolman 1980; Wolman and Davis 1980). Assuming that cutback responses to fiscal stress occur in a rational manner, Wolman (1980) suggests that state and local governments are rational problem-solving organizations seeking fiscal stability. In periods of resource decline, governments look for solutions that are both feasible and effective, so the fiscal policies used to address revenue losses are similar across different governments during economic recessions (Wolman 1980). For example, making use of "rainy day funds" is often the immediate "buying time" action taken by states, as it is easier to access these funds and less visible to the public (Shi 2016). As the severity of fiscal crises increases, governments will move from "buying time" tactics to revenue-increasing strategies or expenditure-reducing strategies (Wolman and Davis 1980). Dougherty and Klase's (2009) analysis of cutback management strategies in eight mid-Atlantic and eastern states confirms that the choices of fiscal policies follow this coping strategy approach.

In contrast to the aforementioned theoretical approaches suggesting a degree of predictability in the patterns of cutback responses, some scholars find great variability in strategies employed by state and local governments due to the unstructured and chaotic policy-making process as well as different levels of control over budgetary expenditure categories (Bartle 1996; Morgan and Pammer 1988). In other words, the third approach suggests that governments deal with fiscal stress in a random manner and emphasizes decision-makers' preferences. In the 1990–1991 recession, states enacted large increases in taxes in response to fiscal stress (Gold 1995), while states were far less reliant on tax increases during the economic recession of 2002 (Maag and Merriman 2003). After comparing budget-balancing strategies used in three different states (New York, Washington, and Texas), Shi (2016) finds that states responded to the Great Recession of 2008–2009 in a variety of ways. Thus, it is difficult to predict cutback responses among states in a systematic and consistent manner. Generally, states can make use of a wide variety of strategies to cope with fiscal stress.

## Public Employment Reduction as a Response to Budget Crisis

The US Census of Government defines public sector full-time employees as those persons whose work hours represent full-time employment with their employing government. Part-time employees are defined as those persons whose work hours are less than 30 h. Full-time equivalent employees represent full-time employees and part-time employees whose reported work hours are equivalent to full-time employees. Contracted employees of governments are not included in the Census definition of public sector employment.

The yearly percentage change in per capita total number of full-time equivalent public employees from 2008 to 2012 for all 50 states was shown in Table 2. Almost all states reduced their numbers of public employees during this recessionary period. Arizona, Georgia, and Maine experienced a 7% reduction of FTE in 2009. Both Hawaii and Idaho experienced an 8% and 7% of reduction of FTE in 2010, respectively. Although most states experienced personnel reductions in more than 1 fiscal year, a few states experienced reductions in just 1 year. Michigan experienced a 2% reduction only in 2008, while Colorado, Mississippi, Michigan,

**Public Employment During Budget Crises, Table 2** Yearly percentage change in total FTE employees per capita

| State | 2008 (%) | 2009 (%) | 2010 (%) | 2011 (%) | 2012 (%) |

(continued)

**Public Employment During Budget Crises, Table 2** (continued)

| State | 2008 (%) | 2009 (%) | 2010 (%) | 2011 (%) | 2012 (%) |
|---|---|---|---|---|---|
| West Virginia | 2 | 1 | −2 | 1 | 1 |
| Wisconsin | 0 | 2 | 2 | −3 | 0 |
| Wyoming | −1 | 3 | −4 | −2 | 0 |

Data source: Author's calculation by using the data from the Census of Government

and West Virginia experienced a 2% reduction only in 2010.

Table 2 also indicates that some states, such as Iowa, Louisiana, Maryland, New Mexico, Oklahoma, and Rhode Island, had to reduce their numbers of employees in more than 1 year (e.g., both 2009 and 2010). Some states like Louisiana, Nevada, and Washington experienced the greatest percentage change in 2012 even though they had already reduced their numbers of public employees in prior years. Louisiana experienced 2%, 4%, 6%, and 7% reductions in 2009, 2010, 2011, and 2012, respectively. This means that Louisiana consistently released additional public workers. This trend suggests that some states had to release more public workers to cope with the financial crisis. In contrast, certain states witnessed percentage increases of public employment in 2012 even though they released public workers in previous years. One example is Kansas, which had an increase of 11% in public employment in 2012 after having percentage reductions from 2009 to 2011. However, the majority of states continued to face percentage declines in public employment per capita in 2012. Evidence from Table 2 and Fig. 1 shows that, for most states, the numbers of public sector full-time equivalent employees per capita were in decline. This reduction was likely the result of budget deficits during the recessionary years.

## Conclusion

Public employment at the state and local level accounts for a large share of state and local public expenditures; therefore, public sector employment is another indicator of the historical trend toward revenue increase and more state and local service provision. Given the same level of public service output, more efficient states or local governments should be able to provide the services by using fewer resources, including fewer public employees and less spending per public employee. Otherwise, inefficiency will be manifested in overstaffed local governments with an excessive number of agencies and ministers, duplication of functions, and the existence of ghost workers (Rama 1997). For a long period of time, bloated bureaucracies and overstaffed public sector represent a potential burden for state and local governments. To achieve broad-based outcomes such as efficiency, it is necessary to maintain optimal number of public employees and enhance the efficient service delivery.

# Public Financial Management Reform in Less Developed Countries: An International Perspective

Hassan A. G. Ouda
Faculty of Management Technology, German University in Cairo (GUC), New Cairo, Egypt

## Synonyms

Budgeting reform; Public sector accounting reform; Public sector auditing reform; Public sector performance measurement reform

## Definition

Public sector accounting reform: The shifting from a less informative accounting system (cash-based accounting) into a more informative accounting system (accrual-based accounting).

Public sector budgeting reform: Means presenting the purpose and objectives for which funds are requested, the cost of programs proposed for achieving those objectives, and the quantitative data for measuring the accomplishment and work performed under each program, instead of only ensuring legislative control over the expenditure of public money.

Public sector auditing reform: Is the process of assessing objectives, programs, and their implementation coupled with economy, efficiency, and effectiveness, instead of only auditing the legality and regularity of the disbursement of public sector fund allocations.

## Introduction

Many governments of developed countries have reformed their public administration system in the last three decades. This administrative reform is characterized by managerial freedom, market-driven competition, businesslike service delivery, value for money, result-based performance, client orientation, and a pro-market culture. These aspects of the administrative reform have been described collectively as new public management (NPM) (Hood 1991). The NPM culture centered itself on increasing the individual responsibility, giving the managers extensive discretion in the use of resources, on output instead of input and on measuring the performance in terms of efficiency and effectiveness. The move toward the NPM has resulted in making parallel reforms in public financial management, as the NPM initiatives have had a substantial impact on public sector accounting and resulted in changing the accountability concept: from accountability in terms of procedural compliance to accountability in terms of efficiency and results (effectiveness and cost-effectiveness). Accountability for results depends on clear objectives stated in measurable terms and on budgets showing the minimum results to be achieved. This must be also based on expenditure limits and on accounting and auditing systems that measure and report on actual results. Of course, this raises the desirability of the public financial management reform (hereafter PFMR).

Basically, both the NPM and PFMR are forming the cornerstone of the public sector reform. There were many reasons underlying the public sector reform for both developed and less developed countries: the challenges arising from global economic integration are one of the essential reasons underlying these radical changes. Globalization is exerting great pressure on the governments to make fundamental changes to the administrative systems, accelerate enterprise reform, and open up the financial system to foreign competition (Fulin 2001). Globalization demands a public sector that is responsive to an increasing competitive environment. It also

demands that governments and public bodies harmonize their goals. Harmonization may ensure that economic development is not stifled and instead provides stimulus for the creation of improved standard living. Therefore, there is an increasing need for proper determination of how public resources are allocated and for monitoring the effective use of these resources. Yet one more reason is the pressure that is exerted by the international financial institutions, such as the International Monetary Fund (IMF) and World Bank (WB), on most countries to make the required economic reform, including the public sector reform. This pressure can be more observed in underdeveloped and transitional economies where international organizations require particular accounting innovations to be effected as a *sine qua non* of assistance being provided (Godfrey et al. 2001).

In addition, the experience of New Zealand can add one more reason which is that the public sector reform has been reinforced by global economic crisis. In New Zealand, the major public sector reforms that began in 1984 were integrally linked with the economic crisis and the conditions leading to it, as well as with political change – namely, the election of the labor government in 1984. Following the election in mid-1984, the incoming government faced an economy with an extended history of economic growth, high fiscal deficits, and high debt including substantial liabilities resulting from various guarantees given by previous governments (Scott et al. 1990; Scott 1996). Then, the sick economy was the impetus for the public sector reform. Finally, increasing the international experience with respect to the public sector reform will result in stimulation of other developed and less developed countries, which have not started yet with the public sector reform, to follow this trend. While the aforementioned reasons can be considered the main reasons behind the PFMR in both developed and less developed countries, the PFMR in less developed countries were mostly due to the pressure exerted by the international financial institutions (donors). In reality, the PFMR is a central element of governance reforms in many less developed countries and an important area of donors' interventions (Morgner 2013). The donors are following the same approaches in all less developed countries, but some donors pay more attention to the technical aspects of the PFMR, while others focus more on the governance aspects in planning, budgeting, performance measurement, and performance audit.

In short, PFMR that are initiated by developed countries in the last three decades are finding new buyers in less developed countries, not as a matter of choice, but as a matter of necessity to make them less greedy of scarce public resources, more efficient, more effective in using scarce public financial resources, and more customer-focused (Chittoo et al. 2009). Accordingly, the main objective of this entry is to discuss in detail PFMR in less developed countries. PFMR include budgeting reform, public sector accounting reform, and auditing system reform.

## Public Financial Management Reform (PFMR)

NPM has entailed a reassessment of public financial management. This has resulted in that effective, efficient, transparent, and accountable public financial management in less developed countries is considered as a prerequisite for long-term and effective use of scarce financial resources. Moreover, public financial management reform became a central element of governance reforms in many less developed countries and emerging economies, and this has demonstrated that revamping of public financial management components is inevitable. These components are:

- Budgeting system reform
- Public sector accounting system reform
- Auditing system reform

### Budgeting Reform

Budgeting system reform means shifting from traditional/line-item budgeting system to performance budgeting system and/or accrual budgeting system. Most of less developed countries are still using the traditional/line-item budgeting system which is designed to ensure legislative control

over the expenditure of public money. However, its format does not provide any indication of the relationship between the expenditure and results, and this prohibits the formulation and execution of an economically viable fiscal policy (Ouda 2013). Besides, it prevents proper choice from among competing objectives, the rational allocation of resources, and blunts the understanding of government fiscal policy, economic activity, and the results. It stresses inputs rather than outputs and controls only the inputs, which in turn, results in inhibiting the ability of the public sector executive managers to diligently manage resources to achieve the planned economic targets. In addition, the most hazardous shortcoming is that the line-item budget has traditionally operated on a "bottom-up" principle. In practice all the governmental agencies and ministries send requests for funding to the Ministry of Finance/Treasury (Schick 2008). It is widely known that these requests greatly exceed what they realistically believe they will receive approval for. In order to come to the real budget, the Ministry of Finance/Treasury negotiates with those concerned governmental agencies and ministries until some common ground for agreement is reached. This "bottom-up" approach has several disadvantages as follows (OECD 2002):

- It is very time consuming and is essentially considered a game; all participants know that the initial requests are not realistic.
- This approach has an inherent bias for overstating the expenditure-allocation requests. All new programs or additions/expansion of the scope of existing ongoing programs is funded on the basis of new requests. Generally, using funds for a purpose other than that originally approved is not permitted under the Treasury rules. There is no system for reallocation within and among ministries and their respective departments during mid-fiscal year, and there are no predetermined internal controls and safeguards against cost overruns.
- It is difficult to reflect political priorities in this approach as it is a driven "bottom-up" with the budgetary allocations "emerging" at the end of the process.

This budgeting approach is an annual [short-term] exercise that makes rational forward economic planning unnecessarily complicated. Furthermore, it encourages dysfunctional behavior, because the method of operating the annual budget stipulates [within the framework of traditional budgeting] all unused appropriations to lapse at the end of fiscal year (Robinson 2009), hence the irrational rush to utilize the total budgetary allocation before the end of fiscal year. In other words, this practice tends toward wasteful use of public funds.

Similar to the developed countries, many less developed countries have attempted to reform their budgeting system by moving from an input-based (line-item) budgeting toward an output-based budgeting (performance budgeting). Performance budgeting is defined as presenting the purpose and objectives for which funds are requested, the cost of programs proposed for achieving those objectives, and the quantitative data for measuring the accomplishment and work performed under each program. Performance budget aims to provide a systematic method of improving the allocation process, to incorporate in the planning activity the recognition of costs/benefits of alternative programs and resources available, and to provide a basis for choosing the most economically feasible [competing] program (Shah and Shen 2007). The adoption of performance budgeting aims at overcoming the deficiencies of the line-item budgeting by indicating the relationship between the inputs and the outputs and whether the resources have been effectively used and the target objectives have been achieved. In short, it focuses on the purposes of the expenditures and the end-results/outcomes of the expenditures and provides data, which can be used to evaluate those outcomes. The experience of developed countries has indicated that budgeting reform comprises the following common elements (OECD 2002):

- Focus on results
- The shift to a more multiyear focus [medium-term expenditure framework (MTEF)]
- Top-down budgeting techniques
- Relaxing central input controls

- Prudent economic assumptions
- Carryovers
- Capital charge

It is worth noting that less developed countries did not follow the developed countries comprehensive approach regarding the budgeting reform, but they have followed partial reform approaches. Some focused on medium-term expenditure framework (MTEF) such as Mozambique, Zambia, Yemen, Algeria, Iraq, Ecuador, Indonesia, Malaysia, and Peru. Some others focused on top-down approach in addition to MTEF, such as Sri Lanka, Jordan, and Morocco. For a proper understanding of the new budgeting reform in less developed countries, for purpose of illustration, two of the aforementioned elements are discussed below.

*Medium-term expenditure frameworks* (*MTEF*) are the basis for achieving fiscal consolidation. An important advantage of MTEF for less developed countries is that it assists in linking the capital and current budgets. Without the coordination that results from such a link, the usefulness of budget information is limited. Moreover, it provides a very clear statement of revenue and expenditure effects of maintaining government policies, and it is considered as a mechanism for controlling the introduction of new policies and tracking the budget implementation beyond a single year. MTEF is defined to be a comprehensive budget planning process and it includes the following stages (World Bank 2010): (1) the development of the macro-fiscal framework that determines the overall availability of resources, (2) overall budget policy and strategy analysis, (3) review of sectoral/ministry strategies and expenditure programs, (4) setting and approval of budget resource ceilings, (5) preparation of the detailed budget for the coming year and forward estimates (FEs) for the following 2 years, and (6) review and approval of the draft budget by the cabinet and the parliament.

In fact, the content of the MTEF can vary among the less developed countries, for instance, in Jordan, the focus of the MTEF reforms is on stages (1–4), which together constitute the strategic phase to budget development. The MTEF reforms in Jordan have emphasized a result-oriented budgeting (ROB) approach involving the introduction of performance indicators and the feedback of performance monitoring information into the subsequent rolling forward of the MTEF, whereas in Lebanon, a full MTEF is still lacking, and the application of MTEF only refers to an aggregate fiscal framework communicated in the budget circular. The overall expenditure level is communicated as a hard ceiling for the current year and as a general guideline for the two following years (World Bank 2010).

Also the time horizon of the application of the multiyear budget framework varies from one country to another, taking into account the particular local needs. For example, in Sweden the MTEF has a 3-year time horizon, i.e., the upcoming budget year and the next two consecutive years. In the Netherlands, it has 4-year time horizon, i.e., the upcoming budget year and the next 3 years. Similarly, the MTEF has different time horizon in most of the less developed countries, usually ranging from 3 to 5 years. It is yet worth noting that while the budget in many of less developed countries is technically prepared within a medium-term perspective, no forward estimates of macroeconomic or fiscal aggregates are presented in budget documents submitted to the parliament (Shah and Shen 2008). Moreover, the overall medium-term outlook has insufficient impact on the budget formulation process as the fiscal forecasts are not used to set expenditure ceilings in the budget circular; this can be more seen in Egypt and the West Bank and Gaza, Afghanistan, and Sierra Leone (Beschel and Ahern 2012). However, the experiences of some pioneer countries, such as the United Kingdom, Germany, and Australia, in implementing the MTEF in their public sector suggest that MTEF can better work in less developed countries if they take into account the following lessons and conclusions: (1) fiscal policy objectives and quantitative fiscal targets need to be articulated and defended at the highest level of government; (2) robust revenue forecasts are critical, and the target level of expenditure have to strongly be related to the macroeconomic prospects over the medium term; (3) budget and forward estimates

are better stated in nominal terms to ensure program managers respond to price changes; (4) the MTEF must be based on clearly defined and fully costed policy proposals; and (5) the MTEF should be accompanied by strengthened measures to review individual expenditure policies and their institutional delivery mechanisms (IMF 2000).

In addition to the MTEF, the *top-down budgeting approach* is used by some of the less developed countries such as Sri Lanka, Jordan, and Morocco. As earlier noted, the "bottom-up" approach has many shortcomings. Therefore, many less developed countries stopped to use the "bottom-up" approach and they have replaced it with a modern "top-down" approach to budget formulation. The "top-down" approach, in practice, has been found to be of great assistance in achieving fiscal consolidation (Ouda 2013, 2015):

- The starting point of the "top-down" approach is for the government, to make a decision as to the total level of expenditures and to divide that "pool" among individual spending ministries. The key point is that each ministry has a pre-set limit on how much it can spend. In other words, each ministry knows from the outset its ceiling of expenditure.
- Once this decision is taken by the government, the Ministry of Finance/Treasury largely withdraws (stops taking part in) from the details of budgetary allocations of each ministry. The Ministry of Finance/Treasury concerns itself only with the level of aggregate budgetary expenditure allocation for each ministry, not the internal allocations within each respective ministry. The internal allocation is attended to by the minister for each respective ministry.
- Each minister is deemed to be his/her own finance minister. Each ministry has a total amount and each minister can reallocate the budgetary provision among that ministry's various agencies and programs. This approach gives each minister greater control over his/her ministry's budget proposals. In this manner, each minister is in a position to identify and select the priority level of each budget program for appropriate funding accordingly.

However, many of the less developed countries have spent a long time to establish the "top-down" approach because the entrenched traditions of both spending ministries and ministries of finance work against it. This is due to the fact that there is no real trust between the Ministry of Finance (MOF) and spending ministries; instead, the MOF is usually very suspicious of the real motives of spending ministries and has a tendency to use its authority to influence on the detailed allocations with the spending ministries. Spending ministries, on the other hand, fear that any cuts in programs they make will be accepted by the MOF, but not the corresponding reallocations for new initiatives. Accordingly, trust should be built between the MOF and spending ministries, and it has been inferred that this trust has not been built in most of less developed countries (World Bank 2010; Ouda 2013).

### Public Sector Accounting Reform

Public sector accounting reform has meant, over the last decades, either in developed or developing countries shifting from a less informative accounting system (cash-based accounting) into a more informative accounting system (accrual-based accounting). Cash basis of accounting is a method of recording transactions by which revenues and expenditures are reflected in the accounts in the period in which the related cash receipts or disbursements occur. Accordingly, the financial statements are usually prepared to disclose information about cash receipts, cash disbursements, and cash balances. Then, the cash basis of accounting provides the user groups with information about the sources of cash raised during the period, the uses to which those funds were applied and the cash balances at the reporting date (IFAC 1991). However, cash-based governmental accounting system suffers from a lot of shortcomings, as it is not designed to provide information on the cost of services including accrued expenses due payable, earned revenues including amounts outstanding and due receivable, accounts receivable/payable, long-life assets, long-term liabilities, accrued interest on external debt, and property inventories. Therefore, periodic financial statements, to show the financial position as at a

given date and the results of operations [as well as the cash flow statement] for a given period up to that date, are not available under the cash-based accounting, which is currently practiced in the public sector of most of less developed countries (Ouda 2006).

Therefore, in an attempt to overcome the cash accounting deficiencies in public sector, many developed countries (e.g., New Zealand, United Kingdom, Australia, Canada, and France) have reformed their public sector accounting systems through moving from cash-based accounting into accrual-based accounting. Similarly, some of the less developed countries (e.g., Indonesia, Tajikistan, Tunisia, Malaysia, United Arab of Emirates, and Kuwait) have already followed this trend by adopting modified accrual accounting (where the physical assets are expensed at the time of purchase), and some others (e.g., Egypt, Saudi Arabia, Republic of Congo, etc.) are in their way to shift to accrual accounting either modified or full accrual basis.

Public sector accounting reform aims at disclosing financial information useful to evaluate the financial position of the country as a whole and also on the departmental level and its financial performance in a manner so as to facilitate the enhancement of the value of its usefulness for the purposes of supporting accountability and decision-making. The full accrual basis recognizes transactions and events when the transactions or events occur rather than when cash is paid or received. The financial statements under the accrual basis disclose the total assets (including current and physical assets), total liabilities (including short- and long-term liabilities), net worth, revenues, and expenses. Accordingly, the measurement focus under the full accrual accounting is on the total economic resources. The accrual basis provides users with information about such matters as the resources controlled by entity, the costs of providing services, and other information useful in assessing financial position and changes in it and in assessing whether the reporting entity is operating economically and efficiently (IFAC 1991). Thus, the full accrual basis provides complete, reliable, and meaningful information.

While the cash-based accounting focused only on cash transactions which include cash receipts and cash disbursement (cash receipts and cash disbursements represent cash inflows and cash outflows, respectively), the focus of accrual-based accounting is on all transactions that have a value consideration expressed usually in money terms and not just cash-based transactions per se. Although the focus of accrual accounting is on all assets, not just cash, accrual accounting records contain complete information on cash flows, and a statement of cash flows is an integral part of accrual financial statements. Accrual financial statements usually comprise (IFAC 2000):

- Statement of financial position (balance sheet), this includes details of all recognized assets and liabilities. The balance of assets less liabilities is referred to, in the public sector, a variety of terms including net assets, public equity, net financial position, or net worth.
- Statement of financial performance (statement of revenues and expenses or an income statement), this comprises details of all recognized revenues and expenses. It shows the surplus (or deficit) of revenue over expenses. This is a useful measure of whether a government has managed to meet current expenses from current revenues and whether its net resource position has increased or decreased. This measure is consistent with one element of golden rules, which states that the government should finance current expenditures from current revenues.
- Statement of cash flows, this encompasses a summary of cash receipts and cash payments during the year, classified under various subheadings (operating, investing, and financing) and reconciles opening and closing cash balances.

The main benefits of the adoption of accrual-based accounting in the public sector are to (Ouda 2015):

- Better manage [stewardship] the assets and liabilities.

- Present a full picture of the financial position of the whole public sector.
- Make more transparent the true cost of the public sector services and activities.
- Improve decision-making in the public sector by utilization of an improved and enhanced accounting information system.
- Improve performance measurement.
- Determine the net worth/state's worth.
- Evaluate economic outcomes relative to intergenerational equity status/situation.
- Provide reliable measures of the fiscal policy implementation.
- Improve transparency of the government's fiscal policy and the integrity of governance.

While accounting reform in the developed countries can be clearly described as modified accrual or full accrual accounting, most of less developed countries made some accounting changes which make the matter difficult to say that one country follows a certain accounting basis. So the situation of the public sector accounting reform in less developed countries can be described as follows (IFAC 1991). There is a spectrum of accounting bases that range from the cash basis of accounting, at one extreme, to the full accrual basis, at the other end of the spectrum. In between, there are many variations that are, in effect, modifications of either cash or full accrual bases. A great percentage of less developed countries lie in the area of many variations. For instance, in Egypt, the accounting system has a mix of cash and accrual concepts that complicates interpretation of the accounts. By virtue of the Government Accounting Act NR 27 of 1981, the cash basis is applied to the current budget with respect to expenditures and revenues, and the accrual basis is applied to the investment budget. The application of the accrual basis to the investment budget means that the operations associated with investment projects should be recorded on basis of what is actually achieved as soon as this achievement is fulfilled, regardless of whether or not it was accompanied by the payments. On the other hand, the government expenditure on purchases of fixed assets is treated as a current expenditure (fixed assets are considered as assets to be consumed in the current fiscal year). In addition, the cost of such assets is not depreciated or allocated as an expense over their useful life. This means that the accrual basis is only applied to the accrued and prepaid amounts in respect to the investment projects. So the capital expenditures and current expenditures are treated by the same way. Hence, the accrual basis is partly applied to the investment budget. However, Egypt has made significant reform for the accounting system through the introduction of a new chart of accounts based on GFS 2001. Since July 2008, the Egyptian MOF and part of the rest of the budgetary sector have started using the new chart of accounts, whose main new feature is the introduction of codes for assets and liabilities that were lacking in the previous chart of accounts (Ouda 2005).

On the other hand, the typical PFM reform intervention on the accounting side is the adoption of modern and internationally comparable accounting and financial reporting standards. This includes making government accounting compliant with International Public Sector Accounting Standards (IPSAS). This was the situation in Jordan, for example. This country appears to have made the most progress with accounting reforms. It is now about to adopt the IPSAS as part of the reform project that includes the implementation of a Government Financial Management Information System (GFMIS) (Beschel and Ahern 2012).

Unlike Egypt and Jordan, the situation was, to some extent, clearer in Indonesia. The Indonesian government has established the government accounting standards which lead to producing comprehensive annual financial statements. These government accounting standards also allow for a transition from cash-based accounting system into accrual-based accounting system, under which the government balance sheet is prepared on a modified accrual basis, whereas the budget and the budget realization reports continue to be on a cash basis. While the Indonesian government has committed itself to move to an accrual basis for accounting recognition of revenues and expenditures by 2008, the transition to

accrual accounting process has taken longer time to be achieved due to several capacity constraints. In addition, there are significant challenges in ensuring reliability of financial statements through consistent application of prescribed accounting standards and procedures (Bastian 2013).

Another trend of accounting reform is to comply with GFS (Government Finance Statistics, IMF 2001) accounts classification. This was the experience of some less developed countries such as Iraq and Egypt (World Bank 2010). The government of Iraq has made some progress in modernizing government accounting and reporting, but the work is far from complete. A new GFS-compliant economic classification system and complementary chart of accounts have been developed and introduced, but implementation remains a work in progress and requires a considerable amount of training and capacity development. While the development of the budgeting system in Iraq is based on the Government Finance Statistics Manual issued in 2001 (GFSM-2001), the GFSM 2001 itself cannot be considered as an accounting system for the following reasons. GFS derive from the United Nations System of National Accounts 1993 (UN-SNA 1993). SNA is designed to compile aggregate financial statistics for an entire economy; government and private activities are combined together. This is in addition to private households and the outside world. Consequently, GFS is a statistical classification system designed to provide statistics that enable policymakers and analysts to study developments in financial operations, financial positions, and liquidity situation of the general government sector in a consistent and systematic manner. The primary purpose of GFS is to provide a framework suitable for analyzing and evaluating fiscal policy, so that government financial information could be compared across economies, as it provides a mechanism to create uniformity in public sector finances across all countries' public sectors.

Although the GFS system is described in standard accounting terms, it is important to remember that it is a statistical reporting system that (might) differ in important ways from the underlying financial accounting system from which most of the GFS statistics will be derived.

So, it can be inferred that the experiences of the great part of less developed countries with the reform of accounting system have been mixed. While most of the less developed countries operate double entry systems, there has been limited success in reforming accounting methodologies toward a consistent use of cash or accruals, let alone applying international accounting standards (Beschel and Ahern 2012). Despite the presentation of only a few examples in this entry, it is worth noting that many of the African and Middle East and Asian countries have a similar situation like Egypt, Jordan, Iraq, and Indonesia (World Bank 2010; Bastian 2013).

### Auditing Reform

Contrary to reforms of the budgeting and accounting, the external audit reform receives less attention in the PFMR program in the less developed countries. Auditing reform means shifting from "traditional auditing system" to "performance auditing system." Traditional auditing system aims at controlling the public expenditures and the use of public resources according to the appropriations limits approved by the parliament. So the traditional task of this type of audit is to audit the legality and regularity of the disbursement of public sector fund allocations. While the traditional audit is more concerned with compliance with rules and instructions, it is not able to assist in assessing management and operational performance of governmental entities and to consider questions of economy, efficiency, and administrative effectiveness of the operations for which management is responsible. Currently, governmental entities are required to continue performing in the most economical, efficient, and effective manner. This implies the requirement for the audit of the governmental entities' activities to be consistent with the PFMR program and not be constrained by the traditional audit methodology (Summa and Waerness 1999). Accordingly, the PFMR program has entailed the shifting to performance audit to make the Supreme Audit Institution (SAI) able to execute and govern the auditing functions in terms of

efficiency and effectiveness. The SAI is considered as a key component in the accountability relationships between the parliament and the executive arm of government (Kiraka et al. 2007). The International Organization of Supreme Audit Institutions (INTOSAI) has given a common international definition for performance auditing: "Performance auditing is an independent examination of the efficiency and effectiveness of government undertakings, programs or organizations, with due regard to economy, and the aim of leading to improvements" (INTOSAI 2004, p. 11). Kahan (1994) states that various concepts of performance auditing at least agree on two basic premises: firstly, public sector managers are responsible for managing public resources according to generally accepted best management practices with due regard for economy, efficiency, and effectiveness, rather than focusing only on legal boundaries; and secondly, public sector policy makers and managers should be accountable for the expected results and outcomes from government activities.

Notwithstanding, most of less developed countries have not shifted yet to the performance auditing. A very few less developed countries only just have started with the adoption of performance auditing, namely, Sri Lanka, Bangladesh, India, and Pakistan.

However, the shifting to performance auditing is fundamental to (Ouda 2015):

- Achieve considerable savings in public money through improved administration.
- Assist the parliament in its role of holding the government of the day to account, through providing valuable information about the government operational performance.
- Assess the management and operational performance of governmental entities and consider questions of economy, efficiency, and administrative effectiveness of operations for which management is responsible.
- Provide parliament and the general public with critical evaluations of a wide range of public sector activity in all governmental organizations and not to be confined to financial statements audits.
- Add value to public sector management with constructive criticism and recommendations for improvement and not only report on performance.

## Conclusion

PFMR in less developed countries has not followed the comprehensive reform approach that has been followed by developed countries; rather, in those countries, a partial and fragmented reform approach has been followed. The PFMR approach that has been particularly successful in most of less developed countries falls into two types: efforts to improve budget transparency and classification and the reform of the accounting system. Ironically, these represent two very different reforms. Budgeting reforms are relatively straightforward and technocratic in nature. An existing body of accepted practice exists to reform economic classification, such as in the form of the IMF's 2001 Government Finance Statistics Manual (GFSM), and there are incentives to align accounts along standard international practice to facilitate the production of comparable fiscal and economic data. Accounting reforms are more difficult than budgeting reforms, as the adoption of accrual accounting is encountering many technical, administrative, and cultural changes. The long history of using the traditional government accounting system (cash-based) in the public sector had resulted in emanating of different accounting problems such as identification and valuation of fixed assets, lack of asset register, identification of government reporting entity and determination of its boundaries, and lack of opening balances. Furthermore, it has been observed that the PFMR has progressed fastest in countries with high levels of external support, whereas domestic revenue performance did not play a clear role. An important lesson from the experience of less developed countries is that launching a PFMR project needs clear government commitment and agreement on the objectives of reforms. Including a significant IT component may help to facilitate agreement on the project, but the project may, in turn, be seen as a primarily technical exercise

rather than one which seeks to change the way policy decisions on revenues and expenditures are made. In less developed countries, project implementation is unlikely to be successful if the project objectives are not appropriately defined.

## Synonyms

Financial administration; Government budget management; Public finance

## Definition

| | |
|---|---|
| Challenges | Situations requiring great applied effort to address or overcome. |
| Public finance | Comprises government activities including: financing, spending, deficits, and taxation; recognizing when, how, and why the government should intervene in the current economy; public financial management; and, regulating the outcomes of making changes to the economy. |
| Public financial management | Concerns prudent management of the collection and expenditure of public funds through the use of efficient and effective financial management systems, processes and institutions of governments. |
| Public sector | Refers to governments and all government managed or publicly owned, funded and operated agencies, entities and enterprises that deliver public programs, goods, and services; however, do not seek to generate a profit. |
| COVID-19 | A highly contagious respiratory disease identified in 2019 that is caused by the SARS-CoV-2 virus, and thought to spread from person-to-person through droplets released when an infected person coughs, sneezes, or talks. COVID-19 has caused a pandemic of respiratory illness. COVID-19 symptoms may be mild (fever, cough, and trouble breathing) or severe (life-threatening pneumonia and organ failure) resulting in death. |

## Introduction

Public financial management (PFM) is a core focus and priority of every nation's government and public sector. Public financial management refers to the art of managing a nation's income, expenditure, and debt level to support civil society (International Monetary Fund 2013). In recent times, public sector financial management has captured the attention of governments, the public, and the media, as all countries across the globe face the severe impact of the Coronavirus (COVID-19) pandemic. This pandemic poses one of the greatest threats to public finances. The challenge of COVID-19 stands out from other crises previously faced by governments due to its enormity, and multifaceted and wide-ranging impact on the very survival of nations and their people. COVID-19 is viewed as a "one-of-a-kind" impactful factor, which governments in the recent past have not experienced nor planned for. Measures adopted by governments to mitigate the spread and impact of COVID-19, such as border closures and lockdowns, travel restrictions, social distancing, and public gathering restrictions, have adversely impacted many nations' revenue sources and also necessitated massive increases in government spending. The global economy is estimated to have contracted 4.3% in 2020 whilst the projected GDP in 2021 is assessed to be 5.3% lower than projections made before COVID-19 (Abdelmeguid et al. 2021). The need for drastic economic policy responses such as amended budgets containing higher spending related to healthcare and relief programs for employees

that have lost their jobs, social security support, business continuity, and the like to address the repercussions of COVID-19 has greatly challenged government financial management. The COVID-19 pandemic has also triggered an immense and ongoing hike in government debt levels across the globe. Furthermore, governments' pressing agenda items such as public health, education, and climate change have in some ways needed to be put on the "back-burner," and scarce available government funding (including acquired debt) has been reprioritized to stem the ongoing spread and impact of COVID-19. Even though there are vaccines available to protect against the COVID-19 virus, the wide-ranging human and fiscal impact of COVID-19 will be felt for many years to come. This chapter discusses the pre-COVID-19 government and public sector financial management norms, COVID-19 impact on financial management, and post-COVID-19 projected financial consequences.

## Pre-COVID-19

PFM has greatly evolved since the 1980s and now encapsulates the discipline of economics, politics, and public administration. The main aim of PFM is arguably for governments to effectively allocate resources and maintain a feasible budget position (that is, the budget is sufficient and appropriate to achieve public objectives). PFM also focuses on achieving macro-economic objectives without exploiting public finances, and ensuring that future adverse impacts on the economy are mitigated. Thus, governments apply specific rules and policies to administer PFM, with the national budget as the main "tool" of PFM. Prior to COVID-19, strict practices were typically applied and followed by governments to avoid budgetary failings and "blow-outs." For example, short, medium, and long-term budgetary frameworks were used to assess the impact of policy choices made now on future finances, with independent fiscal councils to guard budget allocations, performance budgeting, and management initiatives to monitor results, and proper accounting and reporting practices to track the real position of public finances (International Monetary Fund 2013). Prior crises such as the global financial crisis (2007/2008) taught governments many lessons and led to positive reforms in PFM practices. As a result, countries such as Australia, UK, and New Zealand have developed and maintained strong PFM practices in terms of relevant laws, rules, policies, and procedures for making prudent fiscal policy decisions (International Monetary Fund 2013).

The world economy pre-COVID-19 showed clear evidence of expansion. For instance, the world GDP expanded 2.3% in 2019, while advanced economies and emerging markets and developing countries had experienced the expansion of 1.6% and 3.6%, respectively (Abdelmeguid et al. 2021). Additionally, budget deficits were also present in many countries pre-COVID-19. Countries such as the USA and other developed and developing countries had huge budget deficits. "Prior to the COVID-19 pandemic, starting in 2010, a fourth wave of global debt accumulation was underway, with the largest, fastest, and most broad-based hit in global debt in five decades" (Abdelmeguid et al. 2021, p. 12). Global debt and government debt in 2019 were high at around 230% and 83% of GDP, respectively (Abdelmeguid et al. 2021). Also, tax revenue, the major source of government revenue, was on average reported to be more stable pre-COVID-19, and for OCED countries was approximately 33.8% of GDP in 2019. This 2019 figure showed a decrease of 0.1% compared to 2018 figures. However, reportedly the revenue percentage generally kept increasing for a decade before COVID-19 impacted those countries (OECD 2020b).

## COVID-19 Pandemic

The COVID-19 pandemic is a major concern to all governments and public sectors. The financial impact and human cost globally are widespread, with approximately 141 million people

across 219 countries infected (World Health Organization 2021). The COVID-19 pandemic is a global viral emergency with the virus continuing to spread quickly through person-to-person transmission, and affecting people differently – the effects are mild for some, while for others it is more severe leading to death. To control the spread of COVID-19, countries have adopted drastic measures, such as border closures and lockdowns, travel restrictions, social distancing, and public gathering restrictions, which have shown to be somewhat successful in slowing the transmission of COVID-19. However, national and state implementation of these drastic measures by governments across the globe have in combination led to a global lockdown of trade, with other associated economic activities greatly impacted (Kumar 2020). Even with the rollout of COVID-19 vaccination in some countries, it is suggested that the pandemic will continue to wreak havoc across the globe and into the foreseeable future.

## During COVID-19: Financial Management

At a stage where the world is suffering from the dire impact of COVID-19, concurrently the adverse effects on governments and their public sectors have been and continue to be substantial. The year 2020 highlighted the need and importance of public financial planning and management by governments, given the stress posed on public finances by COVID-19. The pandemic has resulted in a drastic decline in gross domestic product (GDP) for both developed and developing countries, and the world GDP contracted 4.3% in 2020 (Abdelmeguid et al. 2021). There has also been relentless direct and indirect impact of COVID-19 on public finances, which has challenged the effectiveness of PFM and the role of government policy makers. While most countries across the globe took immediate actions as COVID-19 struck, there was limited opportunity for long-term well-developed planning, as the COVID-19 danger was ever-present and growing in unperceivable, overall impact. For example, during COVID-19, many financially distressed countries saw rapid increases in expenditure arrears which pointed to failures in expenditure control mechanisms (Ball 2020). Budgets for countries were amended overnight, and on an ongoing basis, in an attempt to respond to and contain the spread and impact of COVID-19. Budgetary expenditures were reprioritized towards public health and social protection. However, the budgetary priority response of specific governments has depended heavily on their country-specific characteristics, resource availability, and the extent of COVID-19 impact. In the case of the OECD countries, the majority of budgetary resources were diverted and made accessible to the health sector (OECD 2020a). For instance, the USA noted an overall drop in national health care spending from early March 2020 when compared to previous years, which was the result of reprioritization from areas such as dental, nursing home, physician, and clinical services, to other more significant areas providing care to tackle COVID-19 (Rhyan et al. 2020). Government and public sector challenges associated with the COVID-19 pandemic have also been further exacerbated by immediate response budgets that were based on limited information. Also, it is argued that the damaging effect of COVID-19 in countries such as India, was not solely due to the direct impact of COVID-19, but the indirect effect resulting from an inappropriate governmental and public sector response to tackle the virus (Ghosh 2020). Hence, it is suggested that PFM must be a key focus of governments and the public sector in such times of crises, due to the massive strain on public finances. Furthermore, governments and the public sector continue to be faced with serious challenges in PFM during the COVID-19 pandemic, as public consultation and monitoring are difficult due to the virus containment measures in place.

As a result of the COVID-19 pandemic, countries have experienced a massive decline in revenues and increases in COVID-19 related expenditure, leading to fiscal deficits and higher public debt. This impact is evident in public sector

finances where the tax revenues and foreign exchange earnings have significantly declined, due to decreases in economic activity and closure of borders and businesses. Value added tax (and the country-specific equivalent) collections have also reduced due to decreases in consumption spending. Similarly, there has been a reduction in employee and business tax collections as many businesses have been forced to shut down and unemployment has spiked. To worsen the situation, government spending has needed to drastically increase to provide public health and social protection during the COVID-19 pandemic, therein further impacting national economies. Also, government spending across the globe continues to increase as the impact of COVID-19 persists. Further increases in government spending have resulted from the provision of unemployment benefits, social security, and grants and subsidies to businesses to keep them in business (World Bank Group 2020). For example, the UK government adopted measures to support civil society by increasing payouts under the Universal Credit Scheme and provided tax holidays and direct grants to affected businesses. Similar rescue plans and packages have been provided by the US government to families, communities, and businesses. In India, relief support has been provided through two major categories: firstly, government spending of about 3.2% of GDP targeted on social protection and healthcare; and secondly, business support and credit provision of about 5.2% of GDP. The Italian government has also adopted similar emergency packages to support the public and businesses. In addition to health care support, the Italian government took up measures to preserve jobs, provide income support to laid-off workers, and business support in terms of tax deferrals, utility payments, and credit provision (International Monetary Fund 2021). It is suggested that public health, unemployment benefits, and small business aid remain as the focus of most national relief plans, but all come at a massive cost to national economies. Hence, as a result of the COVID-19 pandemic, government and public sector systems and policies continue to be challenged to or beyond breaking point, because of the strain on public finances to simultaneously manage current health, economic, and social issues.

## Post-COVID-19 Financial Consequences

For the majority of governments and their public sectors, the COVID-19 pandemic has imposed a severe negative impact on their fiscal positions. Governments and their public sectors have faced financial challenges in delivering the necessary national public services and relief measures, and funding the expenses incurred in mitigating the impact of COVID-19. The persistent decline in income and ever-increasing government spending have shrunk fiscal balances, triggered massive increases in national debt levels, and challenged governments' financial management strategies. World government debt has increased to approximately 99% of GDP and is suggested to be the largest ever recorded increase (Abdelmeguid et al. 2021). While government debt was present pre-COVID-19 pandemic, the debt position of many countries across the globe has increased dramatically "just to get through COVID-19," and will be difficult to manage, and take many years to repay post-COVID-19. Increases in debt levels have typically been of a lesser concern to governments when those borrowed funds were deployed in productive areas. However, COVID-19 debt accumulation has been a necessary debt as opposed to a productive investment with positive returns for government. COVID-19 has forced almost every government across the globe to borrow and spend at unprecedented rates. The amount of debt and speed of debt accumulation is dangerously high for many national economies and could compromise the future recovery and development of many governments. It is suggested that COVID-19 will continue to create manifold, enormous, ongoing global and national PFM policy challenges for government's post-COVID-19. However, PFM challenges were evident in countries such as Latin America for decades pre-COVID-19, where long periods of poor debt management had harmed economic growth (Abdelmeguid et al. 2021). COVID-19 has greatly exacerbated the PFM challenges

already present in these countries. Furthermore, COVID-19 may present similar PFM problems for many other countries post-COVID-19, as the outlook for debt accumulation is highly uncertain and recovery is still unclear.

Almost all governments and their public sectors, whether representative of developed or emerging countries, or with well managed PFM or not, as a result of COVID-19 have needed to borrow at unprecedented levels to combat the impact of COVID-19. However, the existence of inequality in developed and emerging countries' credit ratings has made borrowing by developed countries typically easier. Developed countries' governments have been able to sustainably enter into fiscal expansion at time of such crises as the COVID-19 pandemic, as they could borrow at a lower cost, given their prior debt servicing history. Fortunately, the COVID-19 pandemic and other accumulative factors have resulted in some of the lowest recorded global interest rates being applied to public debt, therein lessening the future debt repayment burden on many countries (World Bank Group 2020). Additionally, many countries such as the USA, Australia, and India have dramatically adjusted their monetary policy decisions involved in setting the cash rate on unsecured overnight loans between banks. These expansionary monetary policies have enabled easier access to credit for government financing. Notwithstanding, debt servicing will remain a challenge for public financial management despite low-interest rates, as many nations struggle to repay debts incurred as a result of the COVID-19 pandemic. For instance, many emerging countries have accumulated larger debt as a result of the COVID-19 pandemic, and which when consolidated with their large debt accrued pre-COVID-19, will probably present a scenario post-COVID-19 whereby the debt financing costs are unsustainable (Buchheit and Gulati 2021). Also, the threat of future increases in interest rates remains bothersome to government policy makers, since countries could still be crippled by the COVID-19 pandemic, and the size of the debt retirement required post-COVID-19 could continue to increase. These ongoing issues have raised concerns among many citizens across the globe in terms of how governments will be able to generate sufficient revenue to fund the incurred and growing debt. The ongoing nature and wide-ranging global impact of the COVID-19 pandemic have prompted commentary that some governments may implement new, additional tax measures and/or review the current tax structures, in order to encourage recovery post-COVID (OECD 2020c). It is certain that all governments and public sectors will be challenged in limiting debt, negotiating appropriate interest rates on those debts, and determining the best workable macroeconomic policy to be able to repay accumulated debt, all while simultaneously not restricting national growth and development.

## Conclusion

The COVID-19 pandemic has tested all governments and their public sectors, and their PFM policies, systems, and controls, some even to breaking point. The COVID-19 pandemic, and its ongoing, wide-ranging, and multifaceted impact, have proven far more dire than previous crises faced by governments, policy makers, and public sectors in recent times. COVID-19 transmission prevention measures such as national lockdowns, movement restrictions, social and economic measures, and the like adopted by the majority of the governments, have restricted national revenue sources and drastically increased government spending, which in combination have triggered massive government debt levels across the globe. To recover from the COVID-19 pandemic, all governments will be faced with exploiting current, and identifying additional new sources of revenue and income streams to offset the massive debts accrued and continuing to be accrued. These burgeoning government debts will have a recurring impact on the future of most countries; a future which remains uncertain. Governments now recognize that financial management policies, practices, and procedures need to be far more adaptable and able to quickly respond to such crises. Hence, it is reasonable to suggest that some governments would be better prepared and able to manage future crises of the enormity of the COVID-19 pandemic, should they arise.

# Public Health Legislation in the Caribbean

Kameel Mungrue
Public Health and Primary Care Unit, Department of Paraclinical Sciences, Faculty of Medical Sciences, The University of the West Indies, St. Augustine, Trinidad and Tobago

## Introduction

Law is an important subdiscipline of public health (Gostin et al. 1999), because it is an effective intervention tool to achieve particular public health goals. Law is defined as a body of rules and regulations governing human behavior, which is enforced by the state through its courts of law. As the preservation of the public's health is among the most important goals of government, the enactment and enforcement of law is a mechanism to influence healthy behavior, health threats, and safety standards.

## Public Health Law in Trinidad

Trinidad and Tobago inherited a traditional common law legal system from the United Kingdom as colony until independence in 1962. It is based on statutes, enacted by the Trinidad and Tobago Parliament and the application of English common law principles. The doctrine of precedent applies and judgments of the Supreme Court of Judicature of Trinidad and Tobago and of the Judicial Committee of the Privy Council still the highest court in TTO are binding, while those of the United Kingdom and the Commonwealth are highly persuasive.

In a small island state such as Trinidad and Tobago (TTO), public health law has had a long history of contributing to the mission of public health, and it has played an important role in achieving development. The aim of this paper is to map the impact of public health law in the control and prevention of diseases of public health importance.

The Tuberculosis Control Act (Ch 28:51) was passed in 1965. The main features of the Act included the "the compulsory removal to hospitals of persons suffering from tuberculosis, and the detention and treatment therein of those persons" and "any person . . . fails to carry out an order or direction contained therein is liable on summary conviction to a fine of three hundred dollars and upon conviction he may be committed to a hospital." There are no studies to show that this Act contributed to the decline in tuberculosis as described by Mungrue (2012). As early as 1973, the Nursery Schools and Primary Schools Immunisation Act was enacted. Section 3 is probably the most important feature of the Act in which it is an offence to admit a child to a school or nursery "unless he produces to the Principal thereof a certificate of immunisation with respect to every communicable disease, save that where a person produces a certificate of a medical practitioner certifying that immunisation against any particular communicable disease or communicable diseases is not advisable on medical grounds." This Act has had a significant impact on vaccine preventable diseases in Trinidad. The Act is implemented through the school health program in which district health visitors check immunization records of recent admission to primary schools, and those children not fully immunized are brought to the required schedule for the appropriate age. The last vaccine preventable disease to occur in TTO was 13 cases of mumps in 2006; therefore, there were no cases of diphtheria, measles, mumps, pertussis, poliomyelitis, rubella, tetanus, or yellow fever in Trinidad and Tobago thereafter.

Traffic accidents are a major source of fatalities and serious injuries. In 2015 the majority of death were in males (88%), the highest proportion of deaths occurred in the age range 25–34, and both drivers and pedestrians represented 32% of the total deaths. One important policy tool that has been used to combat this problem is the passage of mandatory seat belt laws.

The Motor Vehicles and Road Traffic Act has been amended to introduce compulsory wearing of seatbelts, the use of breath analyzing instruments for detection of drinking under the influence of alcohol, and most recently (2014) the use of speed guns by police officers to apprehend drivers exceeding the speed limit. Data from 2006 to 2015 do represent a declining trend in road fatalities from 2008 (Fig. 1).

The most recent public health law introduced in TTO was the Tobacco Control Act, which was proclaimed in 2010. The Act was designed to protect individuals from exposure to tobacco smoke, particularly children and young people, babies, pregnant women, and the vulnerable. It also seeks to prevent smoking by young people especially children, restrict promotional activities by tobacco manufacturers, enhance public awareness of the hazards of tobacco use, ensure that consumers are provided with sufficient information to make more informed decisions on using tobacco products, and prevent illicit trade.

Occupational safety and health in Trinidad and Tobago has been governed since 1948 via the

**Public Health Legislation in the Caribbean, Fig. 1** Number of road fatalities by calendar year 2006–2015

Factories Ordinance 1948 as amended in 1952. As early as 1973, Trinidad and Tobago examined a number of drafts to amend and review the health and safety law. In 2004, the Occupational Safety and Health Act was assented to, primarily because the existing legislation proved to be narrow in scope, outdated, and inappropriate to deal with the expanding industrial sector, and most occupations and workplaces fell far outside the ambit of the legal framework of the Factories Ordinance of 1948. The Occupational Safety and Health Act was proclaimed in February 2006. This Occupational Safety and Health Act 3, 2004, as amended in 2006 provides for the revision and extension of the law regarding the safety, health, and welfare of persons at work in order to keep pace with the country's rapid industrialization. It covers most workers with the exception of workers in private homes (domestic workers) and all aspects of work undertaken in an industrial establishment (defined as a factory, shop, office, place of work, or other premises excluding residential premises) that may have significant impacts on the health and safety of the employees. The objective of the amendment was to strengthen the system of law, which promotes voluntary compliance by facilitating stronger self-governance by the employer and the workers and a more regulatory role by the government. The amendment appears to benefit both employers and employees. It ensures that the promotion of high safety and health standards does not hinder business performance, productivity, and efficiency in addition to addressing employee rights and issues such as sufficient protection and avenues for redress in accordance with the law and good industrial relations practices.

Although not designed to address a particular heath condition, the Regional Health Authorities Act of 1994 was created by an Act of Parliament as part of government's efforts through the Health Sector Reform Program to decentralize the management and provision of health care in Trinidad and Tobago. Prior to 1994 the delivery of health as enshrined in the constitution of TTO was vested in the Ministry of Health (MoH). The increasing challenges related to the inefficiency in the delivery of health care in TTO, such as ambulance response times, accident and emergency waiting times, and lack of hospital beds, provided the catalyst to improve health-care delivery. The new policy objectives centered mainly on the decentralization of services, to five regional health authorities (RHA) whose roles are the providers of health care with the MoH as purchasers of their services. RHAs were established in England by the National Health Service Reorganisation Act 1973 as a replacement for regional hospital boards which were established in 1947 by the National Health Service Act 1946 to administer hospital and specialist services. In 1996 the fourteen RHAs were abolished by the Health Authorities Act 1995 and replaced by eight regional offices of the NHS Executive, which was also abolished by the Health and Social Care Act 2012. Historically from the UK's experience, RHAs have been unsuccessful; it appears anecdotally that complaints echoed by users of the RHAs in TTO have not improved or changed substantially.

## Conclusion

Mapping studies can show what has been done and thus what kind of action government can take. However, intervention studies can determine which legal approaches are most efficacious in improving health environments, behaviors, and outcomes and why laws have the effects they do and what mechanisms we can use to improve the effectiveness of legal interventions.

# Public Higher Education as Social Policy

Kenyatta Lovett
Public Administration, Tennessee State University, Nashville, TN, USA

## Synonyms

College, university; Post-secondary education; Public higher education

## Definition

Civic participation: The engagement of citizens in public and political activities designed to support social and public policy goals.
Higher education: A set of organizations and institutions designated to deliver post-secondary education to citizens within a sovereign jurisdiction.
Health outcomes: A set of qualitative and quantitative measurements to determine the aggregate quality of citizen health.
Modernity: **A public** – collective – view of social norms appropriate for current circumstances within a given society.
Multiple streams theory: A theory established by Kingdon to examine agenda setting norms for policy development, which are constructed through different streams of policy activity.
Poverty reduction: A public agenda established to lower the share of citizens or households below the stated poverty level, based on annual income.
Social policy theory: Paradigmatic frameworks used to examine policy strategies designed for general social welfare.

## Introduction

Strategies for social policy have been implemented through a variety of public programs, originating from different policy domains. Public higher education has long served as one means to implement and render desired social outcomes through policy and practice. Higher education, as distinguished from primary and secondary levels of education, has the capacity and mission to directly address social problems related to the individual, the economy, and the larger society. The alignment between major reforms in public higher education policy and modified social ideals regarding the individual, group norms, and the overall economy highlights the influence of modernity. Modernity, in the discussion of public higher education and social policy, can be examined through the vantage point where capitalism, industrialization, and democracy (Feher and Heller 1983) merge to accommodate action through public policy. The evolution of public higher education in the United States illustrates the role played by public colleges and universities in addressing changing and often urgent, public social needs.

## Higher Education as a Public Good

The national reforms established through the Morrill Acts of 1862 and 1890 and the President's Council on Higher Education in 1947 continue to influence the operation of public higher education across the nation to this day. Both policy events are marked within a period of major societal change for the nation. The first national initiative, the Morrill Acts of 1862 and 1890, serves as the nation's attempt to provide guidance and support across the country for the expansion of higher education. The Morrill Act of 1862 was created to increase access to higher education in every state by establishing land-grant institutions, primarily focusing on education in agriculture and the mechanical arts. The Morrill Act of 1890 expanded the national view on higher education to accommodate an expanded framework of citizenship created by the emancipation of slaves. Both acts collectively established public values for access to higher education across the citizen base, with the perspective of citizen also being modified to account for the emancipated and the disenfranchised. The implementation to address these social goals through the creation of colleges across the nation is also reflective of the segmented view of citizen interaction at the time,

which is evident in the outlay of institutions designed to serve citizens based on race and gender. The public value for access to higher education was a responsive social goal that benefited the individual but also benefited the needs of an economy entering the industrial age, which required more systematic and specific labor requirements than the previous agrarian economy.

Nearly a century later, the national framework for public higher education would expand to address similar adjustments in the collective view of modernity. The President's Council on Higher Education in 1947 addressed many concerns for a changing society and economy. The industrial revolution had advanced to now require varying degrees of specialization across employee classes. Furthermore, the cost of higher education created a new challenge to access, limiting the opportunities for most citizens to participate in post-secondary education. Finally, the nation was entering the beginning stages of a new wave of civil rights reforms, which challenged the equity of public service and access across lines of race, gender, and religious affiliation. To address public concerns of affordability, equity, and access to training and skill development opportunities, the Commission urged states to implement free or low-cost 2-year post-secondary education opportunities, through the expansion of community colleges and junior colleges.

A collective view of the Morrill Acts and the President's Commission on Higher Education further emphasizes the connection between changing social and economic circumstances and the need for national reform through policy and administrative action in public higher education. While the view of the individual and group norms is expressed differently in the two reforms, with one emphasizing a segmented view of society, both are reflective of public perceptions and norms at the time. When combined with changing needs and requirements of labor, a common theme is established that illustrates how labor capacity is addressed to support the economy in the context of current social norms. For this reason, Feher and Heller's (1983) view of modernity helps frame the unique connection between public higher education and social policy, in that capitalism, industrialization, and democracy collectively shape public perceptions of the ideal society.

While there are other national administrative strategies and policy reforms in public higher education that further explain the connection between social policy goals and the outcomes believed to be best produced through the nation's public colleges and universities, their purposes are reflective of, or driven by in many respects, the foundation established from the Morrill Acts and the President's Council on Higher Education. Within each implementation, the public perspective on the ideal circumstance of the individual and the larger economy contributed to the public's desire and efficacy for policy change. Education serves as one of many public goods vital to constructing the desired norms of a society, but higher education offers a more unique and direct avenue for driving change in social policy.

Higher education, as a public good, has distinct differences in comparison to the general view of public education and in some ways other sources of public goods. The primary distinction centers on public higher education's limited alignment with the core requirement of public goods being non-excludable and non-rivalrous. While the opportunity to participate in higher education is open to all citizens, access to this opportunity is restricted by the competency of the individual and the pay-per-use tuition model. This administrative and fiscal framework for public higher education offers policymakers the flexibility to distribute the cost burden of policy implementation to public funding sources, private resources, or to citizens enrolled in public institution. For this reason, participation in higher education for most citizens has limits and often presents clear barriers. Low participation rates in higher education do not, in and of themselves, directly correlate to the issue of public higher education's partial alignment with the non-excludable and non-rivalrous nature of public goods. This partial alignment is also related to far more complex matters of personal choice and other social norms. Labor demands continue to influence policymakers to address challenges with access and participation. As economies mature, the labor requirements rely on the larger

share of citizens to be served by higher education, in order to continue advancing social goals for the individual and the collective society. For this reason, policy approaches to supply adequate and equitable access can fluctuate based on changing economic demands when combined with scarce public resources.

Social policy is designed to address key outcomes for the individual and the overall framework of social norms. The strategies for social policy evolve over time as the context of the environment, economy, and other societal factors change. Higher education serves as one means to carry out social policy strategies in response to new social problems and modified views of modernity. The impact of higher education has been the focus for many areas of research in social outcomes and social policy. These studies have highlighted the connections that drive improvement in health outcomes, poverty reduction, and civic participation and are embedded in the general framework of the ultimate aim of social policy to improve the circumstance of the individual and in turn improve the circumstance of the larger society.

## Theories for Policy Development and Implementation

Several theories in policy and public administration highlight the connection between public social goals and the outcomes considered best produced through public higher education. The political process to establish policy is dynamic and can be explained from various theoretical perspectives. Public higher education can be distinguished from other public goods and services, given the noted barriers to access and participation. These circumstances for the provision of public higher education play a key role in how policy is developed and enacted in a democratic political setting. Individual policy strategies across states within the United States highlight the limited ability of many theories to explain the political processes that connect public higher education to public social goals, which are based on unique circumstances of scarce public resources and equitable access. For this reason, viewing the political process through the lens of notable concepts such as the advocacy coalition framework (Sabatier 1988) or diffusion models captures phenomena either too broad to explain the connection to general concerns for social policy or too detailed to conceptualize the various means by which public higher education renders service to public social goals. Multiple streams theory offers, arguably, the most appropriate perspective on the political process and the policy connection between public higher education and social policy.

The multiple streams theory captures the convergence of ideas, actions, and values required to establish public policy. The originating concept (Kingdon 1984) organizes these activities through three major activity flows – streams: problems, policy, and politics. These three streams, once established around a public problem, merge into one stream of policy action known as a policy window. Routines for agenda setting and political processes determine the outcome of the policy idea at the end of the stream. This refined perspective of Kingdon's (1984) model of the policy development process applies to policy implementation through public higher education for the purposes of social policy. Within the context of this discussion, the originating problem stream can accommodate transactions among policy actors focused on addressing different social problems related to health outcomes, poverty reduction, or civic engagement. The policy stream illustrates the choices available to these actors to make use of different channels of public service provision. The direct impact on addressing social concerns for capitalism, industrialization, and democracy can often favor public higher education as a solution to addressing these social policy concerns. Finally, the political process must establish the acceptance among actors to consider public higher education as a means to drive social change through policy. Public higher education's limited connection with the nonexclusive and non-rivalrous notion of public goods, in many ways, provides a more viable opportunity to the convergence of values and ideas to progress through policy windows and agenda-setting requirements. Also, producing outcomes that improve individual welfare economically further

improve the chances of political acceptance from different policy domains. State-level perspectives on social policy, through the lens of multiple streams theory, can be also explained through the diversity of implementations that not only factor concerns of equitable access and scarce public resources but also the economic circumstances necessary to successfully carry out desired public social goals.

Social policy theory, explained through Kingdon's (1984) view of the policymaking process, offers one explanation for the connection between higher education and social policy. As it relates to social goals to improve health outcomes, poverty reduction, and civic engagement, strategies through the provision of higher education can accommodate policy development from multiple perceptions on the specific social problem in need of remedy. Actors within the policy domain of one particular area of social policy concern may lack the support necessary for ideas to successfully develop into meaningful public instruments for social change. The advocacy coalition framework (Sabatier 1988) can explain the origination of many actors within the policymaking arena that bring forward values for some aspect of social policy implemented through public higher education, but the comprehensiveness of public higher education as a public good can accommodate many different coalitions that converge around one solution. Reforms in higher education carried out in similar fashion across multiple jurisdictions lend opportunities to be examined through notable theories such as institutionalism, diffusion, or network models. However, the diversity of implementations often reveal limited commonality in the details of the implementation, as shown in changes in performance funding for higher education over time. With respect to examining social policy designed to address public concerns for the welfare of the individual and the larger economy, the conceptual framework of multiple streams theory illustrates the convergence of diverse social goals made possible through an implementation source – higher education – suitable for public discourse and agreement, and historically known to render outcomes beneficial to different stakeholder groups.

## Social Policy Outcomes

Social policy implemented through the provision of public higher education has been reinforced over time by evidence produced from researchers in different disciplines. Early evidence of the contribution higher education can make toward social goals focused mainly on poverty reduction through economic and labor strategies. Later research provided additional evidence of outcomes beneficial to public social goals for individual welfare and societal norms. These outcomes were mainly driven by the influences experienced from engagement with higher education through various modes of interaction and skill development. An examination of specific social policy goals to improve health outcomes, lower rates of poverty, and increase civic participation highlights the reinforcing effect of public higher education's contribution to desired social goals and its utility to social policy.

One of the primary targets of social policy centers on improving health outcomes for the individual and the larger society. With improvements to health outcomes, public benefits can be realized through the reduction in public health costs, as well as through increases in economic productivity. Health outcomes as a component of social policy have advanced and transformed with the modernization of medicine, technology, and data use. As structures and systems in public health become more established to examine the factors that contribute to individual and societal health outcomes, a greater focus on the contribution of higher education, and education overall, has served as a means of informing social policy for many researchers (Hartog and Oosterbeek 1998; Winkleby et al. 1992). Some studies have explored the monetary impact associated with health outcomes and higher levels of education (Grossman 1972; Psacharopoulos 1994). The focus on this connection for many researchers has centered on understanding the relevant drivers of social policy that exist outside policy domains traditionally associated with directly impacting social change in health, such as healthcare and human services. Their research and study on this topic emphasize the benefits of better health outcomes, which can be influenced by participation

with higher education, in order to add value to economic productivity and reduce demand for other public goods (Bhargava et al. 2001; Bloom et al. 2001, 2004; Lofland et al. 2004; Wang et al. 2011). Quantitative studies revealing measurable benefits to lowering demand and public costs help to establish a global platform to advocate for improved and more equitable access to higher education.

National studies in the United States have further clarified the policy impact of the connecting health to education and noted the potential of "externalities beyond the individual affected to education and health" (Cutler and Lleras-Muney 2006, p. 22). The welfare of the individual is closely tied to the overall welfare of the household and thus reveals an opportunity to render scalable improvements to societal health outcomes, which can be influenced by education attainment levels. Other studies offer clues to understanding the reciprocal role between higher education and social policy in transforming public circumstances, which in turn trigger revisions in public perspectives of modernity (Baker et al. 2011). The long-term social benefits from larger participation in higher education have the potential to produce "virtuous development spirals" (Bloom 2007, p. 16) that help create the environment for these modifications in modernity to occur.

Poverty reduction, as a component of social policy, is designed to increase individual participation with marketplace transactions of private goods and services and in turn reduce demand for public goods and services. This component of social policy also requires the engagement of actors within the economic development and labor policy domains, which provide the means for individuals to establish successful paths out of circumstances of poverty. The primary platform between the individual and stakeholders within commerce and labor is constructed upon the services provided by post-secondary education. The studies on this connection are abundant and highlight the importance to local, national, and global social policy (Awan et al. 2011; Collins 2011; Ezebuilo 2014; Kiani 2011; Wedgwood 2007). While the determination on the status of good or bad health, and all things in between, may be challenging to assess from a research perspective on public higher education, the outcome of the educated versus non-educated is an outcome easier to connect to quantifiable variables related to personal and household incomes. This circumstance has produced a long-standing connection between the two and has driven much of the policy action to incorporate strategies for public higher education to improve public social goals by addressing issues of poverty. However, studies in counties like Tanzania have found the mere presence of higher education falls short of driving the desired outcomes of a polity to reduce poverty (Wedgwood 2007). Yet, the majority of studies find the outputs of graduates, research, and skill development in higher education produce meaningful and positive contributions to public goals to reduce poverty (Baker and Velez 1996; Kennedy et al. 1998; Muller 2002).

Economic policy and labor policy are closely connected with strategies to improve personal and household incomes. While free markets drive the marketplace activity for capitalistic countries, the rules for activity in commerce are of a public matter and can be seen in various forms of public policy designed to dictate how goods and services can be transacted. Recent economic challenges for countries, states, and local governments have emphasized the necessity of an abundant highly educated and skilled workforce (Michaels 2008). The concern for an adequate supply of human resources for commerce to function effectively has modified the conversation on public higher education, which can be witnessed in new strategies for accountability, funding, and investment. As economies become more globally competitive and labor supply tightens, the value for the provision of public higher education increases, and the opportunities to improve individual welfare become a product of the market's influence on policy.

An important, yet more intangible, component of social policy strategy centers on improving the participation of the citizen in the political process. The strategies to engage citizens are embedded along the public education value chain for all societies. However, public higher education, in

many ways, develops higher levels of engagement and participation experiences for the individual. Also, higher education can offer additional resources to better understand and implement civic engagement strategies through research and program development, which is not as abundantly available in other forms of public educational delivery. The purpose for civic participation is driven by a need to continually modify and improve the public social norms and attitudes. Through greater participation of the individual, the political processes have means to develop policy in a more equitable and effective manner. Low rates of participation, inversely, constrain the effects of well-intended policy and often produce externalities and negative outcomes avoidable through better engagement. Attached to the goal of improving participation rates in the political process is the difficulty of extending public goods targeted for underserved populations, such as the public higher education. Well-intended policies often experience failure or problems and can include free-rider effects due to poor engagement for target populations.

Many social policy studies on higher education focus on the impact of the college experience and how this impact supports public social goals to improve engagement of the individual (Egerton 2002; Hillygus 2005; Jacoby 2009; McIlrath and MacLabhrainn 2007). Positive outcomes related to participation in the political and policymaking process have been identified among college graduates, which also produces other social benefits such as the propensity to engage in public service or contribute to public causes (Hillygus 2005). Course and curriculum-specific connections have also been made between higher education and civic engagement through the use of service-learning programs at many institutions, which incorporate public service projects in standard course curricula (Hillygus 2005). The desired social outcomes believed possible through public higher education for civic engagement are often implicitly expressed through policy. However, evidence from research clarifies the connection between the desires of social policy in this particular area and the explicit contribution made by public higher education.

The evidence of improvements made in health outcomes, poverty reduction, and civic participation highlights the more salient approaches to connecting social policy to public higher education. While the positive impact realized through the outputs of higher education reveals promise of significantly achieving these social goals for a given polity, the administrative and fiscal realities define the challenges faced by public higher education to deliver outcomes in a larger scale. This reality also addresses an alternate perspective on social policy, which centers on the public view of government's role in effecting the outcomes of social change. The combination of the two perspectives illustrates the complex policy environment for public higher education, at all levels of government, that attempts to balance the need for social improvement with the value for government's role to carry out these changes. Nevertheless, the varying approaches to public higher education at the local, state, and national level share a common connection to social policy goals, with respect to driving desired change in health outcomes, poverty reduction, and civic participation.

## Conclusion

Viewing the provision of public higher education through the lens of social policy highlights the opportunity for policymakers to address multiple goals through one means of public service. The policymaking process examined through the lens of multiple streams theory (Kingdon 1984) illustrates the ability of public higher education as a social good to accommodate diverse perspectives to establish a means to enact social change through public policy. The collective catalyst driving action through policy centers on changing circumstances for the individual, group norms, and economy, which often trigger modified views of modernity. The convergence of social concerns for individual welfare and desired group norms within the setting of capitalism, industrialization, and democracy can be addressed within different policy domains. However, evidence of the social impact from participation in

higher education on health outcomes, poverty reduction, and civic engagement reinforces a long-standing value for carrying out desired goals through public colleges and universities. A broader conversation through research and scholarly examination is needed to illustrate the magnitude of the role public higher education plays in social policy as a whole, from the influences that drive policy reform to the outcomes that reinforce public institutions of higher education as an avenue for social change.

# Public Innovation: An Empty Discourse

Carolina Isaza
Universidad Externado de Colombia, Bogota, Colombia

## Synonyms

Innovation in public administration; Public sector innovation

## Definitions

The interpretive approach in public administration refers to an interest in the role of ideas and socially constructed meanings, and their effect on institutions, policies, or governance in general.

During the last decade, the word "innovation" has been appearing in the public administration discourse, used both by scholars and practitioners. A search of Google Ngrams shows books with the words "public innovation" appearing since 1967, with a sharper rise on use from 1997 on. In academic journals, the use of the word "innovation" in the context of public administration has increased since the 2000s. Some have criticized this as a fad, a buzzword, or a magic word. The actors using these discourses often contradict each other and PA scholars suggest that one of the first interesting avenues of research on this area is precisely the analysis of this currently fashionable word, so positively charged but on which there are so many different interpretations. This entry analyzes the meanings ascribed to this concept and whether or not it is just an empty discourse.

The concept of innovation traveled from the Renaissance to the twentieth century changing from a negative to a positive connotation (Godin 2015). It was adopted by public administration in the 1970s, following NPM's enthusiastic adoption of private sector language and practices, via international organizations, mainly the OECD. In the twenty-first century, the word gained momentum in the public administration literature and in government practices and was at the same time denounced as a fad or buzzword with no meaning. The studies on public innovation started to proliferate since 2000 and have doubled since 2010. Most of these studies come from the USA and the UK and are mainly qualitative works, and in particular case studies, but there are also quantitative works with survey data. During this last period, the concept of "innovation" in public administration was imported by developing countries and adopted by different epistemic communities.

So, what are the meanings of the concept of innovation in public administration? The idea that the public sector innovates can be interpreted in two different directions: on the one hand, the public sector can create innovations that have an external application, for society and for solving public problems. On the other hand, the public sector can innovate internally, for its own ends and needs, and this is the precise sense of the phrase "innovation in public administration." However, the meaning of this phrase is not clear and, apart from being a hype, it appears to have many possible interpretations, or even to be an empty concept. "Public innovation" can refer to either or both meanings.

One can observe that the key elements in most definitions used in academic literature are newness or novelty, adoption of ideas for the first time in an organization, and improvement (Gaglio et al. 2017). This last aspect is related to the strongly positive connotation of the word already mentioned. Some suggest that because of these positive implications, the successful changes or reforms in public administration are often presented as – called – innovations.

But despite the clear similarity of these formulations, some authors consider that there is no consensus on a definition of public sector innovation (De Vries et al. 2016). Some also indicate than when conducting interviews with public sector employees, there was a strong confusion over the difference between regular change and innovation per se. Thus, there is still a need to differentiate innovation from similar concepts.

Some authors make a recurrent distinction between innovation and invention, where the first is considered to be involved with the application or use of new ideas, not just their generation. Other concepts, such as change, learning, etc., have also been objects of confusion. For example, "Innovation requires change and the willingness to learn, but change is not always necessarily innovative, while a learning process does not always lead to new ideas [. . .] how radical the innovation is; what is the 'newness' of the change that has occurred and what is the nature of the learning process" (Bekkers et al., 2011: 28). The same authors go on to say that "what is essential is that innovations make a difference, in such a way that the actors involved perceive the innovations as discontinuity with the past" (Bekkers et al., 2011: 31).

However, change can be of different natures. Most authors coincide on the possibility of incremental, radical, systemic, or transformative innovations, as well as evolutionary or revolutionary changes. They vary with respect to the speed and the extent of the changes they entail. But some do not agree with this idea. Efforts to make those distinctions in the literature have been very ambiguous. So far, it seems that there is always an element of something new, but this newness can be relative, an element of change; although for some the change can be incremental and evolutionary, it needs to be perceived as a discontinuity with the past or as significant and enduring. This makes for a very slippery concept and illustrates the problems of its definition. There is a clear need to differentiate innovation from other kinds of change.

On the other hand, as was already indicated before, the public-sector scholarship has been subjected to other similar concepts before, such as *reform* and *modernization*. It is important to differentiate between these and innovation. Regarding the difference between innovation and modernization, according to one interpretation, innovation involves employee empowerment, whereas modernization is more of an institutional change from the top down. Ideas and knowledge management seem to be essential for innovation, while individuals (employees) are identified as the key actors. But as will be discussed later, some still see directive-level staff as the main source of public innovation.

Concerning reform and innovation, reform tries to correct something that is flawed. It could be said that the current use of "innovation" has a much more positive character, trying to identify solutions but not to correct or modify existing institutions. The public-sector reform is also seen as an institutional change of systemic proportions, usually involving legal and even constitutional reforms, implemented with a top-down approach and traditionally without consulting employees.

So there seems to be a difference at least with these well-known concepts of change in the public administration. It can be said, by inference, that innovation is more small-scale and problem-oriented, can be started by any individual or small group in the organization, and involves generating or imitating ideas that are new to the organization or context.

On another level, some attention has been given to how to measure public innovation. Again, starting from the Oslo model for measuring innovation in the private sector, since 2005, the focus of this research has shifted towards innovation surveys. However, survey design takes a long time of experimental research and theory development. Some authors do not try to measure but observe the public innovations via traditional interviews with public servants, while others study the award-winning initiatives, that is to say, they accept what the governments themselves are considering innovative.

An interesting perspective to analyze the process of innovation is the work of Borins, who applies a narratological approach to identify fables and narratives in some award-winning initiatives on public administration innovation. The author found that there is basically one fable across all the initiatives "concerning the origins and inceptions of public management innovations" (Borins, 2012: 11). This story is about long-standing problems in public administration that are approached using a new method. They start with an inciting situation, trying to respond to a policy problem (in most cases social policy issues). In most of the cases, there is interorganizational cooperation, a tendency that apparently is growing rapidly, at least in the USA where this award is given. The author found that initiators in these examples were of middle to high levels in the organization and sometimes actors outside of it. The support of a higher-level executive was, however, a common element of most narratives.

When it comes to the actual evidence of innovation in public administration, despite critiques, there are many documented examples of it and many authors and practitioners insist that it does exist. Most innovations in the public sector are related to New Public Management (NPM) and electronic government or digital services.

The first category, NPM, has been seen as a group of innovations or as a source of them. Most process – administrative innovations in public administration since the 1980s were motivated by

this approach. The second, e-government initiatives, is a case of technological innovation and constitute an area of study on themselves. But NPM is also a reflection of changes in technology (ICT and the Internet), so the two are not unrelated.

Both in the Schumpeterian tradition and in the new public innovation literature, there has been a predominance of the technological component of innovation, based on scientific and industrial development. The creation of the acronym ID+I and its widespread use is a clear example of the close association between these three concepts. Even if the literature recognizes the other types of public innovation (process, governance, etc.) when it turns to examples and evidence those are overwhelmingly technological, mainly ICT based. Most case studies are about e-government, digital government services and apps, and Internet-based platforms for public services.

Apart from e-government strategies and ICT programs, the new form of innovations in public administration are the design "labs," based on the kitchen or the science lab metaphor: a place where people experiment and come out with unexpected results. Decision-makers are presented as designers and innovation as a trial and error process, based on creativity. This "design thinking" has led to hiring actual (graphic) designers. The lab process has been characterized as a process of problem-solving for the development of ideas to create tailor-made solutions, then prototypes and then a definite product or program.

This helps identify the meanings and aspects of the concept of innovation in public administration as it is understood from an academic perspective. Concerning the contents of this discourse, it is still not entirely clear whether it is an empty concept that could be replaced with common words such as "new," "change," "reform," or "modernization." In some cases, it seems to be so, but useful distinctions between some of these concepts have emerged and the categorization into different kinds of innovations, as well as the examples, could be the way to find more concrete meanings and materializations of this idea.

On the other hand, the literature includes critics to the innovation concept in PA. Some critique the idea that public administration can be innovative. There are many perceived obstacles to innovation in the public sector, such as lack of competition or market incentives, bureaucratic culture, resistance to change and risk-aversion, the political nature of the public sector, with its inherent need to compromise and its short-term logic, the need to respond to many constituencies; unwillingness to collaborate with other organizations or obstacles to do so.

So far, there is a strong documentation regarding widespread beliefs on the unsuitability of the public sector for innovation. What has been proved is that there is innovation in public administrations all over the world, or at least, public servants and observers alike perceive that there is.

On the other hand, some critics claim that innovation in PA is "just a fad," meaning that it is an empty word, with no correlation to different PA practices. However, in this section it is shown that the global discourse has some content that is new to PA, and that even if using the word innovation is a hype or fad, it is not entirely an empty word, as it refers to some specific practices and activities identified mainly through the examples: the creation of labs, the use of design-thinking, and the intention to experiment nonproven solutions to problems.

Finally, the literature on public innovation is very different in Spanish (including Spain and Latin America). The most curious finding is in fact the small number of publications, compared to literature in English. The main difference between the two languages is tone; in Spanish, articles tend to have a normative tone, rather than an analytic one, and usually do not contribute original research to the global discussions, but mainly repeat common themes. Here is where the effects of the concept being a fad become more evident. The Spanish-speaking papers are more concerned with how to innovate in public administration than on the "why" and "what" and tend to include prescriptions for practitioners.

## Conclusions

As is the case in private management, fads and hypes are paramount in public administration discourse. Sometimes they can obscure the issues or hide agendas, as has been claimed about NPM's

neoliberal agenda. The word innovation, when applied to the public sector, has been characterized as a fad, a buzzword, or a magic word and has at least some characteristics of an empty discourse (a lack of a clear, concrete signifier).

In general, the language of innovation in PA is very ambiguous, and even more so in Spanish publications. This can be interpreted as people using the words without much attention to or interest in their precise meaning. But there is no consensus as to a definition of innovation or some of its characteristics. It is not clear if incremental innovation is still innovation, or how incremental does it need to be to stop being considered so. The word is also very entangled with close concepts.

Innovation is, in short, another word for change. The concept of innovation is used for public sector reform and other types of change, from incremental to radical, and also as synonyms to newness or novelty, adoption of ideas for the first time in an organization, and improvement. There is an extremely positive, enthusiastic, connotation of the word.

However, when it comes to examples and applications, there emerges a more restrictive use of the term and some concrete signifiers appear. The more specific uses refer to innovation "labs," to design thinking applied to public organizations, to technological innovation associated with disruptive technologies (such as AI) and in some cases to NPM-type reforms.

It can be claimed that innovation in PA is a fad that helps present reforms or changes as inherently positive and that has consequences for administrative structures, practices, and budgets. It is likely that this fad is being used in some countries as a means of legitimating both old and new practices in PA, and also many kinds of reforms and changes. A vague language and empty concepts can be used to dissimulate unpopular actions, giving them the legitimacy of the inherently positive associations of magic words.

## Synonyms

Democratic innovation; Governance innovation; Learning; Public innovation; Renewal; Social innovation

## Definitions

Public innovation is a deliberate attempt at increasing public value by development of public service delivery and policy implementation, often through renewal of governance processes that involves collaboration and experimentation for learning. The desired effects are often hard to capture and may show only in the long run, while unintended consequences of public

innovation measures that are difficult to foresee may be as significant as the planned outcomes.

## Introduction

Few concepts have been harnessed with so much hopes for solving the public sector's problems as public innovation. Governments in Western welfare states have put forward innovation or renewal programs with the intention to de-bureaucratize and open up public service delivery and policy implementation and overcome the continuous funding pressure on public welfare service (Osborne and Brown 2013). Public innovation has also invoked hopes of advancing participation and inclusion to address claims of decreasing democratic legitimacy (Bevir and Bowman 2011). As one can assume with such a panacea to the problems of welfare states and liberal democracy, the results do not live up to expectations (Anttiroiko et al. 2011; Sveiby et al. 2012). Further, public innovation has been pursued by divergent strategies, leading to a mix of governance mechanisms with risk for unintended consequences. Fortunately, public administration and governance researchers have directed considerable interest to public innovation, untangling the concept from various perspectives. This article approaches public innovation conceptually, in terms of public governance, and potential consequences to offer a multidimensional analysis considering what is meant by public innovation, how it is pursued, and with what effects.

## The Concept of Public Innovation

Public innovation has become established as a standard measure in the policy toolbox of governments, which under financial and political pressure can be drawn to address various societal problems. The proliferation of public innovation has meant that it has been attached different meanings in public policy. To unravel these, the practical history of public innovation, the definitions, and its relation to public policy implementation are discussed.

### The Practical History of Innovation

The proliferation of innovation in the public sector has been traced to the world of business. In the market sphere, innovation means the constant need to improve, develop, and re-create the business for competing with rivals for market share and profits. Without innovation, private companies sooner or later fade away and ultimately face annihilation (Clegg et al. 2011). The innovation imperative can best be understood from the outset of Schumpeter's (1942) framing of the capitalist free market, where he famously identified the creative destruction inherent to capitalism and pointed to innovation as part of the mechanism.

The emphasis of innovation, however, sometimes leads to it becoming a self-evident objective or even obsession. In these cases, innovation is raised to a symbol of putative success, where it loses the position as a technique or tool for renewal and starts to generally connote renewal, development, and progress (Sveiby et al. 2012). The value of innovation is often strengthened by positing it to the opposite, or lack of innovation, and depicting it as stagnation, withering, and failure.

The discursive articulation of innovation as a symbol also assisted in translating it to new environments, which is one plausible reason it has caught on in the public sphere. As such, innovation was conveniently packed as a fix in the business toolbox that was adapted to the public sector to meet its putative malaises starting from the first large public sector reforms in the 1970s in the USA under President Reagan and in the UK under Prime Minister Thatcher, commonly known as the New Public Management (NPM) reforms (Anttiroiko et al. 2011).

### Definitions on Innovation

Innovation as a term is closely related to invention, which means the coming up of a new idea or a discovery, especially in the field of technique and engineering. Researchers have distinguished between these two by ascribing innovation the meaning of implementing a new concept, product, or system, whereas invention is reserved for the meaning of a more isolated novel idea or practice. In business, innovation is commonly thought of in

terms of a novel product, process, position, or paradigm – constituting the four Ps of innovation in business lingo (Rogers 2003). Innovation as product refers to a new output sold on the market, process to a new organizational feature improving the activity of the company, position to the redefining of an existing product or process to new better use, and paradigm to a novel breakthrough setting the framework of thinking in a field or the society as a whole. Although the four Ps are widely seen as an outdated typology of innovation, it offers an explanation for how innovation is seen and why it still may connote technical progress over, say, social, even in public sector. Increasingly, researchers and business executives talk of creating a culture of innovation in companies (Clegg et al. 2011). As culture, innovation refers to an endogenous capacity and will of renewal and progress. The cultural meaning is, however, easily confused with a creative culture and, moreover, hard to both promote and measure, increasing the risk of innovation becoming an empty symbol (Sveiby et al. 2012).

In the public sector, innovation has been denoted the prefix public to signify the implications for the concept contingent upon environment (Osborne and Brown 2013). More exactly than so, it has not, however, been defined, giving rise to different interpretations. It is, perhaps, easier to start by demarcating the meanings that often are left out from public innovation. Public innovation seldomly refers to a product, if we by product think of a novel organizational output that has been given a patent and by which one seeks competitive advantage. In the cases where it does, e.g., a new IT system of specialized public health care, it often serves an added public value rather than organizational value. Moreover, public innovation generally refers to a process or improved practice, interorganizational collaboration, or a new structure designed to improve public service (Torfing and Triantafillou 2016).

The public value is of course a problematic concept with the ever-increasing use of cross-sectorial partnerships and hybrid organizations, but roughly it translates to a value that is offered to citizens universally, or which have a value that is impossible or meaningless to calculate per head (e.g., street lights, basic education, and basic pension system) (Van Dooren et al. 2015). Public innovation sometimes goes under the name of social innovation, which connotes the social value of renewal, e.g., improved social conditions for the needy (Caiden and Puniha 2011). Other related concepts are governance innovation, which refers to systemic renewal of the processes of governing society, categorically implied to be democratic (Anttiroiko et al. 2011), and democratic innovation that focuses on the democratic value of systemic or procedural innovation, often having citizens' participation or inclusion as objective (Bevir and Bowman 2011).

## Practices for Public Innovation

Public innovation, as any innovation, is assumed to thrive on experimentation and learning. Moreover, the public sector has been considered too bureaucratic and hierarchical to innovate on its own. Putatively, the public sector should collaborate or involve private companies, universities, and other agents that ignite the processes of public innovation. To render these possible, autonomy from the hierarchical public administration has been thought to be a necessity. But how can autonomy, or freedom for an agent to act as he or she sees most fit, be provided while simultaneously maintaining accountability and public discretion? Public innovation, in other words, presents the state or government with a governance dilemma (Sørensen 2012).

Initially, the state was assumed to enhance innovation by withdrawal from the operative activity and let the non-state agents manage the street-level activity (Torfing and Triantafillou 2016). The state should, at most, govern from distance, or be hands-off, by providing incentives for innovation through system design or resource and agent facilitation (Sørensen 2012). The strategy of metagovernance, as it became to be called, ascribes a reserved role for the state, which, although recognized to have a part to play in public innovation, is primarily responsible for ensuring due process and use of funding (Peters 2010).

The role of the state has, however, been gradually reconsidered when acknowledging the unique resourcefulness of the state (Andersen 2016). Further, it is not only a question of funding, but many public officials working as middle-range or street-level bureaucrats have acquired substantial knowledge in their specified field of responsibility. This has resulted in practitioners and researchers asking whether the state and its public administration should, in fact, be let into the operative activity with non-state agents for innovation. The hands-on approach, or interactive governance strategy, has been prescribed the state to engage dynamically in the process of innovation on all levels and steps. The interactive governance strategy has especially emphasized the importance of taking the complexity of the environment into account and evaluating the contingent effect for innovation.

The two strategies are, however, diametrically opposed and present practitioners with a question of balancing the trade-offs. Having more of hands-off means giving away hands-on governance. Although some authors have suggested a combination of the approaches for an eclectic strategy (Sørensen 2012), others have warned for the plausible unintended consequences (Vento 2019). Importantly, it seems the strategy should match the environment so that in situations with a functioning market and competition, metagovernance is probably the right choice, while in cases of partial markets or no natural markets, interactive governance should be embraced.

## Recognized Consequences

Public innovation has been pursued for decades, but what can be said about the effects? If approached from the policy perspective as output, the most truthful but uninspiring answer is that we do not know. This has more to do with the nature of innovation than the attempts to evaluate it. For one thing, public innovation has presented evaluation with the thorny dilemma of how to capture and value the novelty of a process that often takes a long time to show an effect (Brulin and Svensson 2012). It is not unheard of that the experimentation and learning of today seems useless for a while before revealing their true value in the future, perhaps in a completely different setting or field. Moreover, public administration and governance researchers are at least as interested in the process by which innovation is pursued as in the output. The strive for innovation has, namely, given rise to new institutional arrangements and changes in policy design with potentially unintended consequences for traditional public administration functions (Vedung 2013), such as accountability (Christensen and Laegreid 2016).

Public policy and the process of making and implementing it can be devilishly hard to define without overlaps (Hill and Hupe 2014), as any student of public administration surely is aware of. In public policy, innovation is categorically a measure for achieving a desired outcome, be it the renewal of a sector for increased competition, a geographical region for well-being, or more narrowly a process for achieving improved welfare service. In practice, this usually implies collaboration between state and non-state agents (Montin 2007). In fact, most policies endorsing collaboration pursue innovation, either explicitly articulated or implicitly implied. These policies have been labelled "third-generation policies" to distinguish them from other types of policy that go more to the core of the traditional state's functions, such as security, law, and basic welfare service (Jacobsson et al. 2015). As such, public innovation can be said to have shaped the design of modern public policy.

These side effects of public innovation have first and foremost led to uncertainty for management and governance. In times of evidence-based policy-making and intelligent governing that rely on performance and information management, the problem for evaluation adds cumulatively up to problems of governance (Vento 2017).

## Conclusions

Governments have pursued innovation with gusto in the last decades in Western welfare states. The

hopes have been on public innovation to solve the funding pressure constantly overshadowing public services. The popularity of public innovation and the flurry of activity for innovation have, however, created a conceptual and a governance problem by watering down the meaning of public innovation and creating a mix of governing mechanisms for pursuing it.

This article has distinguished between innovation typologies and discussed their historical development. Public innovation has been defined as a novel process implemented in the public sector. Products and other types of innovations can be demarcated to the private sector based on the functional logic of the public sector putting public value first.

The role of the state is a classical dilemma in public innovation. Should the public sector abstain from operative activity and govern at distance to let non-state agents autonomously innovate, or should the state utilize its unique resources and authority and engage hands-on in the activity? Research suggests the strategy should be decided contingently based on whether there is a natural market in the environment or not.

Lastly, the effects of public innovation have been hard to establish. To a great deal, this is because innovation entails experimentation and learning, and the value of the process may become evident only after a long time. The side effects of innovation have been recognized in the process of public governance. The quest for innovation has shaped the institutional arrangements, the policy design, and the management procedures. Although often overlooked, this underside of innovation is at least as remarkable for democratic governing of society as are the desired innovations in public service and policy outputs.

## Synonyms

Common preferences; Community significance; Citizens' will; Public good

## Definitions

**Public interest**: It is the outcomes attained when government leaders discharge their obligations for long-run survival and well-being of the society particularly public institutions providing quality services to the citizenry.

**Government institutions**: Offices established by law and financed by tax payers' money to foster the benefit of the general public.

## Introduction

Serving the public is a fundamental mission of government institutions. This duty transforms a civic ideal into a responsibility for government managers. Globally, public officers occupy prominent and prestigious positions in their communities and society at large to offer citizenry benefit. However, individualism dominates today's public life at the expense of common benefit. Individuals prefer to work as government executives in order to gain opportunities to pursue personal needs instead of promoting what is good for an entire community (e.g., common preferences, citizens' will, and equality). According to Denhardt and Denhardt (2007), enlightened statesmen find it difficult to adjust these clashing interests and render them obedient to the good of the citizenry. The current debate rests on whether legislators, regulators, educationists, and courts exercise their tasks and duties in the execution of government obligations as they occupy outstanding positions to foster the wellbeing of the public.

There is no kingdom without subjects and no modern state without citizens. Thus, the ruler or modern administrator is not an independent being, but an interdependent integral part of his own-self in a relationship with the larger society within which he operates. The leader deals with citizens that are not contented with the government and they question whether their interests are put first. As public servants execute their tasks and duties, the way they discharge their obligations becomes an issue. Government officials are not responsive to the demands of their citizens. The involvement of government officials in policy-making may create a risk of decision-making getting captured by powerful and special interest individuals that are less representative of public opinion. Government administrators are duty-bound to make decisions and take actions for public benefit. This concept is associated with assumed citizenry needs; public managers are expected to serve the interests of their society. As public servants execute their tasks and duties, the way they discharge their obligations becomes an issue. Economic individualism and self-based values dominate today's public management at the expense of the

common good. The participation of public officers in policy-making may create a risk of decision-making getting captured by powerful and special interested individuals. As a result, policy-making venues may be overly crowded with interest groups that are less than representatives of public opinion, and particularistic policies may be adopted benefiting a few interests (Bozeman 2007).

## Public Interest

Public interest has multiple meanings and appears not to be specific. Authors explain it in terms of common interest, public significance, or common good or anything of interest to the public. The notion of public interest can be approached in two ways: formally, by emphasizing the process of defining the public interest, and substantively, by focusing on the content of public interest. The common interest entails aggregated individual interests equaling to the public interest. The public interest arises out of the "Will of All" conception, that is, individual interests are aggregated. It involves the outcomes best serving the long-run survival and well-being of a social collective construed as a public. It is what happens when citizens discharge their obligations and successfully claim their rights. It is achieved when citizens get the sense that public institutions provide them quality services. In order to achieve the common good, civil leaders and individuals alike must seek what is good for the whole society rather than what promotes individual or minority interests. Public interest is about the superior ideas and concerns for the good of society, rather than self-interests that motivate political action. It also brings with it a basic concern with social ends and goals. It is a society where the values of the whole would not differ from those of any specific individuals (Downs 1962). The "common good" – or the general welfare – is an important ideal for governments, as they must act in pursuance of public interest. It is the motivation of public officials in exercising their functions to achieve the common good of the collective, by improving democracy and social and economic welfare.

This "adding of interests" is complicated. Scholars argue that public interest is not equal to the sum of all individual interests. Critics of this construct argue that it is context-specific. Philosophers over time have been reluctant to define the public benefit. They argue that it is a combination of several habits of mind in making decisions and making policy. It attempts to deal with multiple ramifications of an issue rather than a select few, seeking to incorporate the long-range view into deliberations, to balance a natural tendency towards excessive concern with short-term results; considering competing demands and requirements of affected individuals and groups, not one position; recognizing that to say that the "public interest" is problematic is not to say it is meaningless.

Public interests are derived from preferences held by individuals (who may or may not hold public office) about the private or collective behavior or condition of others, including the behavior of the government toward the polity at large or toward some subset of it. These preferences are those that are being taken into account when we see behavior of the kind which Kalt and Zupan (1984) call "ideological." They differ from private preferences in that they are "other-regarding"; unlike purely private preferences, they exist only in a social context. Private interests are the standard stuff of which modern economic and political analyses are made. Private individuals, some of whom hold public positions, have private preferences. These preferences determine the private welfare of the individual holding them, and are separate from those of other human beings. Related to choices between states of the world, they define an individual's "private interest", which can be inferred for each individual from a mapping of her (his) private choices. Aggregated through a political mechanism, private preferences of individuals create either a general or a special interest (Denhardt and Denhardt 2000).

## Historical Evolution of Public Interest

Cyrus the Great of Persia, ruling some 2,600 years ago, is asserted by the ancient Greeks to have

believed that a ruler should "understand" how to govern people so they may have all the necessities of life in abundance and might all become what they ought to be. The implicit rationale for this was to achieve approval, and thereby stability, and make ruling an empire that much easier. After Cyrus died, his sons (immediately quarrelled), cities and nations revolted and chaos erupted because of the lacking common good that emerged. The phrase 'public interest' seems to have gained prominence during the seventeenth century. In 1609, a French satirist, Regnier, argued that public interest is something governments invoke to justify unjust or illegal action, though he actually used the phrase 'raison d'etat'." In England, the 1624 Statute of Monopolies, while considered to be discussing the public interest matter in concept, used the phrase (for patents not in the public interest) "generally inconvenient." Similar references of being "inconvenient to the Commonwealth" appear in patent letters at the same time. However, by around 1670, the Lord Chief Justice of the King's Bench of England was referring, in an essay on access to ports, to wharves being "affected with a public interest."

The historical perspectives in regard to protecting the interests of the greater society are seen when kings, emperors, and sultans reigned according to God's will which was to follow his command, the people's will was demonstrated. It was seen as a divine order which was represented by earthly reign among these leaders. The sovereign was perceived as a mediator between God and the people. Serving God implied obedience to the sovereign. During the seventh century, this obedience was getting weaker. The Glorious Revolution in England (1688) is a good example of how a sovereign (i.e., the king) was pressured to shed his absolute reign and to share power with parliament so as to foster the interests of the English people.

About 100 years later, the French revolution shows more or less the same development when the king and his wife were not following God's laws of promoting the interests of the French people. Modern States are inspired in the principles of the French Revolution that changed the Old Regime to a new social organization based on the values of liberty, equality, and fraternity. The State as a moral entity is – or should be – the guarantor of such values. The State has grown to become one of the most important institutions in many aspects of societies. Public servants pursue their own interest and regulations are brought in to balance the interests at stake (like Pareto or Kaldor-Hicks criteria). The law is more optimistic when using public interest to proceduralize collective interest. Even more, public interest serves as justification for government intervention in economic affairs; in the last decades, the promotion of integrity and prevention of corruption have tackled self-interest of government officials, leaving space for the public interest to be pursued by governments and public officials.

After a process of creating more distance between the sovereign and the people during the seventeenth and eighteenth centuries, eventually the people grabbed their interests. This is seen by the death of royal absolutism in the seventeenth and eighteenth centuries, and the rise of ideals of representation meant "power to the people," i.e., parliaments. According to Goodnow (1967), the expression of the "state's will" can be seen as the main function of parliaments as carriers of "politics." Administrations execute that will. Such insights started to influence the restructuring of politics, even in countries like the USA, whose pre-Weberian nineteenth century's spoils system was very strong. "The grand administration scandals, the efforts of civil service reformers, president Garfield's assassination by a disappointed office-seeker, and the huge Republican losses in the 1882 elections" are seen as causes of the abolition of the classical spoils system, which is marked by the passage of the Pendleton Act in 1883. This act had two important consequences. First, it prohibited mandatory campaign contribution; second, it implemented entrance examinations for would-be bureaucrats and therefore it is the start of the merit system in American public administration. Entrance examinations reflect a step forward in the intellectual professionalization of public functions. In ways like these, the "de-politicization" of bureaucracy took hold. Politics became the domain of ideology and

administration of expertise. Following the American Pendleton Act, a Civil Service Commission was set up to administer a system based on merit rather than political connections. Four years after the passage of the Act, 86,000 jobs were classified as unavailable for political appointments. Other countries, with less obvious hybrid systems, but comparable politicized administrative orders, went through different, but comparable transformations.

In Africa, the former ruler of Zaire, present day Congo, Mobutu Sese Seko, amassed wealth equivalent to US$5bn (equal to Zaire's entire external debt) prior to being ousted in 1997 (Warf 2017). Kenya's Daniel Arap Moi stowed away millions of dollars through false exports of gold and diamonds at the expense of Kenyans. These are not isolated cases as evidenced in the recent actions of the Arab Spring. Tunisia and Egypt were among the earliest and the most visible of these revolutions and lately Sudan. This is largely due to public officers being self-centered, and neglecting the needs of the general society. In Uganda, citizens are not satisfied with the services of government officers and keep questioning whether their interests are put first. For example, one of the main reasons for underdevelopment is the low-quality education especially at primary level. Education is considered to be the foundation for the support of economic growth and development. This East African country has a centralized educational system headed by Ministry of Education and Sports. While, schools are expected to be responsible for the provision of quality education to pupils, this has not been the case and remains an issue of public concern. It is estimated that 68% of children who enroll in primary school drop out before completing primary education. In this regard, at least 80% of the pupils in low primary level cannot work out a two-digit subtraction and 61% cannot comprehend a simple short sentence. Many pupils in public schools study under trees when they are hungry, and, in most cases, are taught by equally hungry teachers. The education offered in government schools cannot provide quality education needed to propel Uganda out of poverty and towards national development.

## Dimension of Public Interest

Kwemarira et al. (2019) have attempted to conceptualize public interest to include: common preferences, citizens' will, and egalitarianism. These scholars developed items to measure the three dimensions of this construct. The questions developed were anchored on a six-point Likert scale, ranging from 1-Strongly Disagree to 6-Strongly Agree. They argue that African respondents tend to tick or answer the not sure/middle point which is avoided here with the six-point Likert scale. The measurement items were subjected to both validity and reliability tests. Content validity was determined by giving the instruments to nine respondents who were experts and practitioners in the field of public interest. The researchers in that study went on to perform EFA by running principal component analysis as the extraction method using Varimax with Kaiser Normalization to explore factor structure of the study constructs. This helped to summarize variables from the constructs with multiple questions into more meaningful and interpretable factors. Besides, EFA also enabled those scholars to test for validity of the study items. After performing EFA on that data, CFA was carried out to construct the CFA models. Only those dimensions and respective items that were retained at EFA were used to carry out a CFA using Analysis of Moment Structures (AMOS). Based on that study, common preferences did not survive after conducting CFA; meaning that citizens' will and egalitarianism are the indicators of public interest in sub-Saharan Africa.

## Conclusion

This entry concludes that there is need to develop coherent critiques and policy proposals that further the cause for common good. The scholars deduce that it may be prudent for public officials to behave according to the scripts that are in accordance with communal benefits. Each government steward has different duties; hence a need for a universal code which equates public benefit that caters for all the citizens. This echoes the importance of guardianship: "Quis custodiet ipsos custodes?" (Juvenal

circa 55–127). Juvenal's celebrated phrase, "But who will guard the guardians?" is often used today to question the efficacy of guardianship of public leaders. While government workers are first-tier guardians of public affairs, sometimes, they are wrongdoers. A conclusion of public servants being responsible on their analytical, legal, consensual, and social aspects is opined. Government workers have responsibilities and considerable authority which should be used – albeit wisely. Analytically, they need to regularly and methodically appraise and analyze the various aspects in their public roles. Communal administrators have legal responsibilities and obligations; therefore, they ought to be mindful of fostering societal needs.

# Public Leadership Meta-skills

Petri Virtanen[1,2] and Marika Tammeaid[1]

[1]ITLA The Finnish Children's Foundation, Helsinki, Finland

[2]The University of Vaasa, School of Management, Vaasa, Finland

## Synonyms

Forms of collaboration; Joint sensemaking; Leadership metacognition; Shared leadership

## Definitions

As societal complexity deepens, public leadership meta-skills become ever more important. Leadership meta-skills refer to generic leadership competencies (and skills) which are by nature both individual and representative of the collective capital of those in public administration leadership positions. Meta-skills are the essence of developing today's public institution leaders since they constitute joint sensemaking, know-how, and competencies which cut across organizational boundaries within government, public institutions, and public organizations, ignoring the compartmentalized sectors and organizational silos within public administration.

## Introduction

Public institutions and organizations make their contribution to society through the democratic process, based on political goal setting, with the help of stakeholders and cooperating partners (and service providers), delivered by the performance of public administration personnel – and, via the subject of this entry, through leadership practices.

Virtanen P, Tammeaid M 2021. Public leadership meta-skills. In: Farazmand A. (ed.), *the Global Encyclopedia of Public Administration*, Public Policy and Governance. Springer.

The focus of this entry relates to leadership meta-skills which is a theoretical, conceptual, and empirical topic and a relative newcomer in public leadership studies. Despite the fact that the evolution of public sector leadership and management studies has been a lengthy one – both in terms of theory and practice – there is definitely a scarcity of research evidence about leadership meta-skills (on the genesis of public sector leadership; see e.g., Van Wart 2003, 2013, 2017). This entry explores what leadership meta-skills in the domain of public governance, policy, and administration are, why they are important, and from where do they evolve, as well as the practical implications of this from the development of leadership meta-skills in the context of public government, policies, and administration.

The motivation behind this entry is to further scrutinize the recent literature on public leadership meta-skills including our own work, for example, Tammeaid et al. (2021) and Virtanen and Tammeaid (2020). Public leadership meta-skills, we have argued, refer to generic leadership competencies (and skills) which are in nature both individual and representative of the collective capital of public administration leaders constituting joint sensemaking, know-how, and competencies cutting across organizational boundaries within government, public institutions, and public organizations, ignoring the compartmentalized sectors and organizational silos within public administration. From this perspective, public leadership meta-skills are not government branch-specific but rather overall skill requirements for all leaders in public administration. Learning to learn, taking the learned into practice, and critical thinking are among those meta-skills that are discussed in Virtanen and Tammeaid (ibid.), for example.

It should be noted however that the question of meta-skilling and meta-skills has been discussed to some extent in the leadership literature. A relevant example being Holten et al. (2015) who presented a model for an effective leadership training program that ingrates elements related to human biology, holistic learning processes, and the ingredients of transformational leadership elements within the context of change management. For these scholars, the notion of meta-skills refers to a set of skills which managers "can use and adapt to the changing demands and conditions of modern work life." Like Tammeaid et al. (2021) and Virtanen and Tammeaid (2020), Holten et al. (2015) underline the point that meta-skills are elementary in bringing the lessons learned from training back into practice into the "real life" of organizations and the enabling role these meta-skills bring about to the habitus of the public sector leader – that is, if public leaders do not possess this ability, the consequences can be seen in the performance, motivation, and enthusiasm of their organizations.

One key motivation for exploring public leadership meta-skills is the need to determine per se the new rationale for public leadership. This new rationale calls for more cooperation, bridge-building, and joint sensemaking across the bastions of government topped with the need to conceive resilience not only as a adaption mechanism to acute and severe societal crises (such as COVID-19, for instance) but also as a distinct and specific policy goal. When New Public Management (NPM) and New Public Governance (NPG) emerged as mainstream management paradigms in the 1990s, the global context for public institutions was radically different than it is now. Although it is perhaps somewhat controversial to say that the complexity of society has increased, today public institutions face complex societal problems (which are manifest on a global scale) and undergo more profound contesting from media, political actors, and populism than ever before. The operating environment of public institutions and public leaders is thus pretty much different than it was only a couple of decades ago. Today, public policy planning based on reductionism, narrow definitions of societal problems, and dividing critical societal issues into "governable pieces" is not only flawed, but it makes no sense from a wider societal perspective. The solution to wicked societal problems cannot be solved in a single policy domain but in collaboration with input from multiple policy sectors. Complexities in society as well as the volatility of change and the ambiguous role of societal shocks require cross-sectoral thinking and action, something which cannot be split to separate pieces. As such, this development calls for an understanding

of what public leadership meta-skills can provide – an understanding that the whole public administration from all levels of governance (transnational, national, regional, and local) forms a systemic network, where a readiness and capacity to interact with the society has to be developed as a whole not in parts.

Consequently, the aforementioned changes in the operating environment of public institutions have brought about new challenges for the delivery of public services. These are the art of developing and putting forward the diversity of co-creation mechanisms and models, introducing a new accountability logic addressing the role of service users as key players in judging the value and merit of public interventions, and building cooperation networks to maintain and innovate service-dominant logic practice throughout the structures of public administration. These drivers of change point to the necessity of thinking differently and thinking together at the upper levels of top civil service. What is needed is a new kind of cognitive diversity which results from cross-sectoral professional leadership training, multilevel dialogue, and cross-boundary collaboration between public institutions, business, and nongovernmental sector which pinpoint and underline the essence of leadership meta-skills as defined above.

Secondly this entry explores the theoretical and conceptual framework behind the leadership meta-skills distinctive to public institutions. Thirdly, the typology of leadership meta-skills is presented and discussed. These meta-skills constitute a comprehensive set of leadership skills that are interlinked and can be learned but only if there is the will to learn. Section "Practical Implications" discusses the practical implications of learning, nurturing, and scaling meta-skills in public institutions. These meta-skills contribute to systemic change in government and public institutions taking us through the mechanisms of the human-centered approach to leadership and the understanding of society as a complex entity. The fifth and final section "Conclusions: Synthesis and Further Research Agenda" sums up the findings of the entry and, in addition, sets out the research agenda necessary to learn more about public leadership meta-skills.

## Theoretical and Conceptual Lenses to Leadership Meta-skills

This section explores the theoretical and conceptual roots of leadership meta-skills. The section is divided into four subsections, the first section "Distributed Leadership, Meta-Governance, Metacognition, and Sensemaking" concerns the leadership phenomenon and organizational agency, the second section "Systems Thinking" systems thinking as an approach to conceptualize societal change, the third section "Positive Psychology and the Role of Positive Emotions" the role of positive psychology and positive emotions, and the fourth section "Solutions-Focused Philosophy and Building a Better Future" the role of solutions-focused and future-oriented thinking as the fundament of organizational agency.

### Distributed Leadership, Meta-governance, Metacognition, and Sensemaking

*(a) Distributed leadership* is about sharing leadership practice, tasks, and responsibilities. It is closely related to concepts such as "shared," "collective," "collaborative," "emergent," and "co-" and "democratic" leadership. According to Bolden (2011), the concept (and practice) of shared leadership proliferated rapidly among academic circles as well as professional practice (especially in the field of education) around 20 years ago. Common across all different variations of shared leadership practice is the idea that leadership is not the monopoly or responsibility of just one person or authority. Another common feature in the diversity of definitions of shared leadership is beginning from a collective and systemic framework in respect of organizations, thus conceiving leadership as a social process. An interesting question here is: how well distributed leadership as a practice fits with organizations undergoing change? According to Fitzgerald et al. (2013), for instance, good and solid pre-existing professional relationships underpin the capacity of distributed leadership to implement service improvements in service organizations implementing change. Conversely, poor professional relationships, insufficient team building, and conflicts erode the concerted capacity of

distributed change leadership. This finding suggests that the whole organization has to be geared toward leadership distribution in order to succeed in implementing organizational changes in a proper and successful manner. From the perspective of leadership meta-skills, the distribution of leadership is a relevant approach since it captures the idea of leading together with cross-sectoral leadership competencies.

According to Gjaltema et al. (2019), *(b) meta-governance* did not attract considerable attention in the public management literature until the last few years. Originally, meta-governance appeared in public management studies during the 1990s as an "organizational" or "thematic" solution to governance failures enhancing the accountability, transparency, and trustworthiness of governing networks and the proper use of public funds and resources. Moreover, one established the use of the concept referred to in rather general terms such as the "governance of governance or the organisation of self-organisation." Based on their recent systematic review and conceptual analysis on meta-governance practices, Gjaltema et al. (2019) conclude that meta-governance is "…a practice by (mainly) public authorities that entails the coordination of one or more governance modes by using different instruments, methods, and strategies to overcome governance failures." The essence of this definition is the different mechanisms and practices meta-governance adopts in coordinating and maintaining publicly delivered and/or funded activities in society. This requires cross-governmental approaches to leadership which, in turn, establishes a new type of relationship through meta-governance dynamics between government, governance, and the leadership of public institutions (e.g., La Cour and Andersen 2016).

To a certain extent, *(c) metacognition* is a conceptual parallel to distributed leadership. It conveys the idea of being conscious about what we think about how we and others think which is similar to the notion of distributed leadership ("being aware of what I think about leadership and what others think about that"). According to Metcalfe and Shimamura (1994), for instance, metacognition is "cognition about cognition" or "knowing about knowing" which comes from the root word meta in metacognition referring to as "go beyond." Albeit metacognition refers to the overall consciousness of individual and collective thought (i.e., knowledge about cognition); it also has a more specific dimension that relates to learning and problem solving (i.e., regulation mechanisms that govern the use of cognition). Both of these components of metacognition are relevant when problematizing the nature of leadership meta-skills. The practice of these regulation mechanisms has remained a consistently hot topic of academic debate over disagreements about the architecture of the mind, its epistemology, and the ethical aspects of reading one's mind (see also, Efklides and Misailidi 2010).

In simplified terms, *(d) sensemaking* refers to participating collectively through a process in "which active agents construct sensible events and structure the unknown" with the aim of achieving collectively more than people would do by themselves (Weick 1995, pp. 4–5). So, sensemaking is about bringing collective meaning to events that take place in an organizational setting. Making sense of collective terms – and following Weick (ibid.) – is about creating one's identity, handling issues and events together and retrospectively in a social process in an ongoing manner. Thinking in terms of public leadership and leadership meta-skills in particular the ability to make sense of the operating environment is central to strategic sensitivity. From the perspective of strategic management, strategic sensitivity and strategic imagination more or less replace traditional strategy formulation and bring strategic thinking into play as the everyday organizational collaboration practice of public leadership (see also Peng 2018).

## Systems Thinking

The strength and value of leadership come alive in interaction – in interaction between human beings and collective institutions. The underpinning logic here relates to conceiving public institutions as forming a systemic network. Systems approaches have a long history in organizational and public policy studies: understood and conceived from the perspective of systems, organizations, and public

policies have been conceptualized in their environments as "rational, natural and open systems" (e.g., Scott 1987; Maguire et al. 2006). Over the decades, for instance, general systems theory (GST) has affected greatly these domains of scholarly work. Scott (1987, pp. 85–86), for instance, has argued that this has been the case because a large and growing number of organizational scholars tended to look at GST as a source of learning in terms of designing organizations – e.g., their workflows, control systems, planning mechanisms, and efforts to improve organizational performance – and how best this could be set up in order to carry out their missions. Drawing heavily on GST, systems design gradually entered the field of public policy. According to Von Bertalanffy (1968, p. 32), there are models, principles, and laws that apply to generalized systems or their subclasses, irrespective of their particular nature, the nature of their component elements, and the relations or forces between them. It is however important to note here that looking from an organizational perspective, there are a variety of ways to approach organizations as systems.

Reed (2006, p. 26) argues that this conception of organizations as social systems entered the field of organization studies in the late 1940s and the early 1950s. This was followed by the evolution of GST, originally developed within the scholarly fields of biology and physics which, in turn, provided considerable conceptual inspiration for the subsequent development of what is now known as socio-technical systems theory and "soft system" methodology and which actually dominated the field of organizational studies until the late 1970s and the early 1980s. This development reflected a wider renaissance of utopian thinking which presumed that the functional analysis of organizations as social systems would pave the way for the new conceptual and theoretical foundations of a new science of society. Seeing organizations as systems can be categorized in multiple ways, but analytically these varieties fall into two main categories: closed and open systems. Closed and open systems share common features but differ from each other significantly. For instance, closed systems are responsive only to changes initiated by their own elements, whereas open systems receive inputs from its external environment. Open systems interconnect with other systems, thus laying the foundation for complex systems that are hard to predict because they are often very difficult to understand (e.g., Bardach 2008, pp. 338–339, 353–353).

In summary then, a complex system is an emergent and open system, and a comprehensive entity comprised of a large number of parts dynamically interacting with each other in a nonlinear way, with each part behaving according to some rule or force that relates it interactively to the other parts. Public institutions and organizations – and the sectors of public policy – are closed systems when we focus on organizations from the inside. Furthermore, public organizations operate also as open systems since they are – in real life – interlinked with institutions and forces that take place outside of public administration and connected with other institutions and environmental complexities that surround them from the outside. It is noteworthy to remember then that the transformative approach to public sector change considers change in a similar manner to that of open systems as they are open and adaptive to environmental pressures, utilizing different adaptation mechanisms to cope with change (e.g., deterministic, optional/negotiable, isomorphic, or pragmatic adaptation depending on the strength and nature of environmental pressure (see, e.g., Christensen and Laegraid 2016).

## Positive Psychology and the Role of Positive Emotions

Since Peterson's and Seligman's seminal book (2004), positive psychology has provided a new conceptual frame for better understanding how human beings, organizations, and work change by looking at the role of positive emotions, individual strength-based competencies, and individual and collective resilience processes and models (mental adaptability) (Green et al. 2017). Positive psychology has reversed the pathological approach to human well-being and capabilities to sustaining virtues, strengths, possibilities, and human growth. Positive organizational scholarship is still in its developmental phase, but interest

in actions that lead to positive processes and outcomes in organizations is as important for public sector organizations as it is for any other sector. As such, the strength-based approach generates promising answers to the deadlocks encountered by traditional competence management and transformative ability approaches.

Organizations building on strengths are characterized by their approach to utilizing the resources and enthusiasm of every employee, digging up unused potential for the use of the organization, basing the advancement and the evolution of tasks more on what the employee would like and could do than what he/she has done thus far, investing in facilitating good teamwork, making use of the diversity of people instead of standardized job descriptions, encouraging creativity and innovation, seeing problems more through the lens of mismatch than the lack of gifts, and encouraging employees to live a life suitable to oneself (Linley et al. 2007). All of these are also important features in orchestrating systems change in organizations and societies.

In her "broaden-and-build" theory, Fredrickson (2013) described what positive emotions mean to people's learning and the way they act. When overcome by negative emotions is like walking while wearing blinkers: observations and thinking are narrowed and the ability to learn from the situation is limited. On the other hand, feelings of positive curiosity accelerate the ability to learn and create new kinds of thinking and action even in challenging situations and with only fragmentary elements.

Broadening positive emotions and building on them is an important part in strengthening psychological, physical, and social resources and widening the flexibility of operations. The ability to engage in critical thinking is important in analyzing information and making reasoned judgment, while positive emotions help in observing any matter from multiple perspectives, taking different types of knowledge and experience into account, identifying and testing different alternatives, and considering their pros and cons. So, critical thinking should not be conflated with criticism, ruling out uncustomary observations and viewpoints and deteriorating relationships.

From the perspective of public leadership then, it is crucial to understand the importance of the positive emotions behind human activity and in developing a genuine interest in people, their ways of thinking, and their different realities. Systems thinking and the transformative approach to public sector change as well as leadership in public organizations can gain a lot from positive psychology in releasing positive human potential in societies and in public sector organizations.

## Solutions-Focused Philosophy and Building a Better Future

Solutions focus (or solution-focus) is a vivid global practice in all professions dealing with people, yet it is not often described from the point of view of theory building. The reasons for this lie in the people-centrism nature of the solutions-focused approach which takes people's experiences, worldviews, and values as the starting point for all interventions. Solutions focus highlights the priority of practice, since "practice is something no one can do away with. Humans can stop thinking and reflecting or even be fully unaware of their doings, but they cannot stop practice" (Theory of Solution-Focused Practice 2020).

Solutions focus builds on ideas of cybernetics, complexity, communication, feedback, social constructivism, and language philosophy, namely, the work of Ludwig Wittgenstein. Originally it was developed by therapeutic practices of Milton H. Erickson and the theoretical development, clinical practice, and empirical research of Insoo Kim Berg and Steve de Shazer (Theory of Solution-Focused Practice 2020). Over the last 30 years, it has been applied across many areas of society, like leadership, human resources, healthcare, school, work design, organizational development, training, and coaching.

As a social constructivist approach, solutions focus abandons the enlightenment-based assumption that there exists an unbiased mind and objective facts that are waiting to be discovered in human and social behavior (Barret 2015). Instead, it reminds us that interactions and perceptions are context-bound and subject to individual reflections. No problems, issues, or successes arise in

a vacuum; attention must always be paid to the context. And if we want to make a positive difference, to building a favorable context. What we perceive affects what we think and what we think is portrayed in how we act. Meaning is created through social interactions, and that goes also for words having no fixed sense. Language is always used in relation to different contexts and other persons, and knowledge is first and foremost an interactive social achievement, not a private accomplishment.

In addition to seeing people as "holistic systems in interaction with systems," solutions focus makes a fruitful basis for skills development, leadership, and systems change by seeing people as enactive, capable, and resourceful – especially when invited to interaction nourishing their best features and virtues. This is a remarkable paradigm shift to appreciating the knowledge, experience, and strengths in different people and basing further development on that instead of orientation toward filling people's supposed skills gaps.

Building on what is working in human existence and interaction, solutions focus puts into action the things that a latecomer, positive psychology, researches (Bannik and Jackson 2011). The solutions-focused approach stays away from offering explanations from power or expert positions and underlines the importance of creating and hosting an interactive space where the best human features are nourished. This is done by nurturing collaborative and dialogical relationships and practicing the so-called not-knowing position (Malinen 2004) by withholding judgment in terms of drawing consequences and staying actively curious of the way in which another person perceives the world.

The solutions-focused approach is cognizant of the fact that all interaction involves several contexts (personal, social, legal, political, cultural), stretching the human ability to engage in de- and recomposing, while framing and reframing from multiple viewpoints is at the heart of learning and development. In problematic situations the solutions-focused approach offers a "context of solutions" through open- and future-oriented questioning. Solutions-focused questions address, indirectly, the context that has created the problematic situation and explore possibilities for new understandings and new kinds of action to emerge (BTA-Practice Definition Group 2020). So, instead of imposing external views or learning on a person, the solutions focus aim is to widen the view of possibilities and rearrange the knowledge and learning residing in people and groups.

For deep learning and systems change, solutions focus practice offers conversational tools enabling people to become aware of their own possibilities, to strengthen people's agency, and to enable meaningful change. Solutions-focused philosophy and future orientation create a basis for addressing difficult issues and processing conflicting views in a manner that stimulates renewal.

## The Typology of Public Leadership Meta-skills

### Selection of Leadership Meta-skills

In a world of intertwined issues and interconnected societal problems, an important emerging question is how to raise and renew public leadership capabilities in order to face the various trans-contextual societal challenges on the one hand and, on the other, lead the transformation toward the needs of a changing world. These challenges call for the turn from the traditional leader-centered approach of change and capability building to systems thinking, networked leadership, and a more relational approach. Developing as a leader is a personal lifelong process which deserves constant attention and reflection, but an important part of leadership is also to enable others – personnel, colleagues, and cooperation partners – to develop, and to learn so that organizational practices are transformed to generate better administration for citizens and clients.

In every role in the public sector, it is important to reach out to other contexts and strive to understand how things look from the perspective of others. For civil servants previously accustomed to taking care of their own plot inside the legislative frame, coming to the edge of their own competence can be distressing and often raises concerns over desirability and permission. It is

an important mission for public sector leaders to clear space for transformation, variety, experimental tryouts, and new ways of working. Leaders' actions have a profound impact on organizational cultures as well as the public sector's ability to renew itself and achieve good results. Public sector leaders are in a position to redesign public administration structures and workflows in order to take advantage of, for example, more joint working platforms and cross-administrative approaches which respond better to the current needs of citizens and act as enabling catalysts in societal development.

Organizations learn through both individuals and collectives (Chiva and Habib 2015), and they learn in a timely fashion only if enough learning loops are embedded in everyday processes of organizations and networks. For leadership, this means shifting the focus to developing meta-skills both as personal skills and organizational practices, i.e., capabilities that are overarching and transferable from one sphere to another. Meta-skills are important in building the readiness to tackle varying issues regardless of the public sector branch.

Sometimes meta-skills are approached by publishing listings of "working life" and "future skills" and renewing them regularly (e.g., World Economic Forum). However, vital meta-skills are always dependent on the contexts in which people operate. Therefore, it is not fruitful to spend too much time discussing which skills are included on such lists and which are left out. It is more important to understand the nature and importance of meta-skills and their role in generating renewal and good results. Meta-skills that seem to be particularly important for public sector leaders in a fluctuating and complex world are dialogical positioning and an enabling mindset, learning to learn and harnessing thinking skills, taking a systems approach, and putting things into practice. All of these facilitate good trans-contextual interaction and promote integrative change and renewal.

### Learning to Learn

From a foresight and future perspective, there is one meta-skill that outranks all others: learning to learn (Virtanen and Tammeaid 2020; Senge and Sterman 1992). Learning cannot be portrayed as something that happens mainly at school or university and only during the earlier years of life. Good leadership is a constant process of learning. Changing the world and its operating environment requires a change in the way of thinking and acting. Everyday challenges can be seen as learning challenges for individuals, teams, organizations, and networks. They require reflection and the building of renewing learning loops individually and jointly as well as positively curious minds and persistence in overcoming obstacles and failures in building new knowledge. Critical questions in all leadership tasks include: How do I learn myself? Do I take time for it? Broadly enough? And how do I help my organizations and networks to learn from different sources of knowledge (cumulating experience, client interface, data, scientific research, tacit knowledge, foresight, creative approaches). In the context of systems change, learning to learn is the ability to view one's own activities as part of a larger context and finding new and constructive ways to be and act as part of the emerging entity. Organizations in transformation need third-loop learning (Romme and Witteloostuijn 1999), which is not memorizing but creating.

### Systemic Understanding

Acting intelligently in a complex world calls for understanding that no human community is a machine or other entity based on mechanistic cause-and-effect relationships. Instead, there are many parallel realities present all the time. Individuals and collectives have their own, multi-angled perspectives, and the whole is made up of individual and shared narratives (Cronen et al. 2009). Achieving change is always a process and requires a new kind of joint sensemaking, interaction, and feedback loops. In the systems approach, the illusion of ability to control human systems and societies is replaced by understanding that every part of a systemic entity affects the whole as in a game of dominoes. Action as part of the system can be enabling or opportunity-reducing. Instead of describing and mapping the properties of the system, it is more important to see each other as part of the system and ask what we want

to create together as part of the system. The fastest way to bring about change is to set in motion many small parallel processes that lead in the same direction (Termeer and Dewulf 2018).

### Harnessing Thinking Skills

Narrow conceptions of knowledge and a desire to solve complex issues with one mechanical approach or power are still common features in public administration. Harnessing thinking skills helps to overcome these rigid mental models. At the core of this transformation is the meta-skills of questioning your own and common beliefs and established practices in a constructive way. Thinking skills refer to metacognition, i.e., the ability to understand how one thinks and how other people construct their thinking, including how motives, beliefs, and emotions guide thinking, how decisions and choices are made, how they could be made better, how to test the reliability of the data and different scenarios, how to practice creative and intuitive thinking, and how to reinforce mental resilience.

The solutions-focused practice of framing and reframing (Mattila 2001; Sparrer 2007) is both a practical and deep-seated way to develop one's perceptional choices and mental flexibility. Framing chosen for dealing with different issues affects a great deal of possible viewpoints and outcomes. Testing with different framings can lead to useful reframing, accelerating change. When a solution is co-constructed in interaction with reflection and open questions, it has already cultivated the subcultural and habitual ground of behavioral change. It is also important to note that since language defines our thinking, the use of language is also an instrument of thinking skills (McKergow 2013). Human beings and organizations make constant choices over how they describe issues, incidents, and significant others. Choosing excluding and negative definitions reduces opportunities for good interaction and favorable outcomes, while choosing collaborative language and definitions creates cooperation.

### Dialogical Approach

To succeed in leading people and enabling them to realize their capabilities to their full potential presupposes abandoning hierarchical and autocratic relationships. People usually have different roles in organizations and networks, but any collective functions best when it is a place for human working with human, not positions or statuses colliding with each other. The dialogical approach itself does not strive to new actionable solutions but merely seeks to widened understanding of different experiences and contexts, building bridges between them. Isaacs (1999, 2007) defines dialogue as an art of thinking together and an actionable skill, which improves the conditions for any cooperation or change.

Joint sensemaking happens through dialogue, and therefore dialogue is both an approach or mindset and an everyday skill used to create a dialogical environment giving freedom of thinking and expression for everybody and consequently maintaining interaction on an equal basis. As an everyday skill, it contains reciprocity in terms of giving time and appreciation to relationships and interaction. Gergen et al. (2007) have, for instance, emphasized dialogue as having often unrealized levels of coordination and insight originating from relational responsibility, self-expression, affirmation, coordination, reflexivity, and the co-creation of new realities that help people to function in systems in a way that is fruitful for themselves and others.

### Enabling Mindset

An enabling mindset – rather than a problem and deficit focus – is the breeding ground for seeing and taking new opportunities, creating new ways of working and interaction, and, even more importantly, appreciating the natural transformative capacity human beings and communities have. Organizations should pay greater attention to *how* than *what*, when it comes to common procedures, and focus on cultivating the enabling mindset. Human beings and human collectives are complex by nature, and no living system can be completely controlled. This basic rule of thumb in relation to complex human systems is useful to bear in mind also in the daily life of organizations and leadership. Echoing Capra and Luisi (2014), living systems can, however, be disturbed, and therefore it is important to ensure that the

disturbance practiced (e.g., by leadership) has a positive effect.

Change begins with the assumptions people bring with them. Paying attention to the strengths and capabilities of the components of a systemic whole increases the functionality and developmental capacity of the human system. On the other hand, paying attention to the shortcomings and deficiencies of the components of the system reduces the functionality and development opportunities of the system. No systemic whole is irreversible in terms of reducing it to its parts, and, as such, it is the interaction of the parts that makes it unique. The ways of working and interacting in organizations are man-made and constantly evolving. The quality of the interaction determines the functionality of an organization.

Starting from what already works and learning from that, expanding successes and building on resources produces very different change results from those attained by avoiding failure or diagnosing problems. Planning by backcasting from the preferred future brings remarkably different results compared to looking at the past or focusing on describing why a problem exists. Although organizations and other human communities are not machines, there is a historic ballast of organizational scholarship to treat them like they were. Investing time and effort in good interaction and common platform building, opening up new viewpoints and possibilities, and building in intrinsic motivation require an enabling mindset and seeing human diversity as an asset. It also brings a different view on competence development taking it from filling competence gaps based on external assessment to setting goals together and supporting growth. An enabling mindset pays conscious attention to positive deviations and builds on them.

## Reaching Out to Praxis

Many people have good and even innovative ideas, but putting them into action is a meta-skill that deserves special attention and practice. The idea of separating, on the one hand, planning and implementation and on the other strategic and operational management does not work in a systemic and networked world. That is also the reason why most of these plans gather dust on shelves instead of changing much on the everyday level. The way decisions are made is of great importance. Likewise, the implementation process and the means chosen have a significant impact on success in reaching strategic goals, as well as on people's experience and behavior. No one can completely control a living system, so the only thing that can be influenced is our own actions in the system.

Promoting systems change is an organic process starting from inviting people to take part in the change, allowing for individual ways to participate, cultivating a process feeding the change in practice, staying curious and open to learning opportunities that appear along the way, and learning from the process while running. From a system's point of view, leadership can best be described as utilizing one's opportunity to influence in a particular situation or from a particular role within the system.

In principle, leaders' opportunities to show an example and enable change are greater than others. Two important ways of putting things into action in the systemic world are purposefulness and experimentation. The first meaning, primarily, explores the desired future in order to see in which direction the system wants to move and building a way forward instead of continuing with analyzing cause-and-effect relationships. The latter – experimentation – means taking an experimental attitude to discovering possible futures by action learning and experimentation.

There is a long tail of enlightenment supposing that thinking and reflection – "strategic planning" in governance terms – come before action. Social constructionism and enactive cognition have reminded that the process can also work in reverse (e.g., Barret 2015; McKergow 2021): knowledge and action are linked; cognition is embodied and includes also nonlinguistic meaning-making. Experiments and design thinking are therefore an important addition to public sector's ways of knowledge creation and sensemaking.

## Practical Implications

### Enabling Systems Change

Developing meta-skills increases public sector leaders' capabilities in leading their own organizations in a positive way and working as a trusted part of egalitarian cross-sectoral networks. As a whole, developing meta-skills increases the resilience of the public administration and its capacity to act as a catalyst for future societal change. Meta-skills carry within themselves the notion of not trying to make either structures better or develop the individuals but rather to affect the systemic whole via multiple interactional paths. Meta-skills bring in a remarkable amount of Aristotelian virtue *phronesis* to public sector organizations and their ways of functioning. According to Darnell et al. (2019), there are two particularly important functions that *phronesis* performs for its possessor: first the ability to examine the situation from multiple viewpoints and pursuit ethical deliberation toward finding the best possible way forward and, second, especially in dilemmatic situations, prioritizing solutions that integrate different components of the good life.

Meta-skills also derive from pragmatic philosophy the notion of seeing imagination, communication, and context as essential parts of decision-making and of putting thought into practice (Ansell and Geyer 2017). In these iterative processes, emotion is intertwined with cognition and forms an integral part of solution building and skills development (ibid. Ansell & Geyer). Perception, consciousness, and emotions are often forgotten, but are a strongly related part of organizational and systemic learning (Bateson 2016; Chiva and Habib 2015; Roeser and Pesch 2016). Developing meta-skills is also an ongoing and lifelong process running parallel with everyday life and work. Working in different organizations (i.e., top civil service rotation), spheres, and cultures nurtures the ability for meta-skills development by making tangible the systemic principle of the "fish being the last to notice the water." Governments that actively promote work rotation are better off in terms of developing leadership and civil servant skills related to understanding and using trans-contextual knowledge.

### A Shift Toward Human-Centered Leadership and Systems Views of Change

The human-centered governance paradigm is gaining in importance (UK Policy Lab 2018; Bason 2017), and meta-skills enhance the qualities that are needed in dealing with multi-contextual intertwined issues and reduce the tendency toward legalistic reductionism and managerial tunnel vision. Meta-skills also unpack the assumptions that lie behind traditional thinking of how change happens. Very often leadership and administrative actions reveal a belief in a causal logic of change based on commanding, using power positions, ordering, warning, restricting, threatening, or advising from an expert position. All of these are however generally ineffective ways of affecting human thinking and behavior in a sustainable and transformative way. They generate little or no change and promote external learning, negative emotions, and a loss of trust. Accelerating systems change and human-centered leadership mean looking at change as learning and co-creation.

The human-centered approach also challenges the customary ways of measuring and evaluating change by developing it in a more mission-driven and systems-based direction (Lähteenmäki-Smith and Virtanen 2020). Traditional research questions and approaches around result orientation and accountability echo dualistic thinking interested in whether a change has happened or not. This kind of examination, however, leaves out the characteristics and nature of societal and human change. It relies on a managerial change view, where the change can be predicted, planned, and verified. There are strong tendencies toward a top-down view, strong belief in mechanistic and hierarchal manageability, and repeatability in the organizational world, and these reductionistic tendencies seem to be strengthened in the spheres of measuring and evaluation although they fit poorly with today's complex world (e.g., Lowe 2013).

Systemic change involving multiple parties means different learning for all the different groups and individuals, since they participate in the transition out of different contexts, backgrounds, roles, and strengths. In social change there is no "push button" that would start the

desired progress everywhere and in any circumstances. Meanings are always co-created, and accelerating systemic change means taking a living systems approach, cultivating the dialogical conditions and nonlinear thinking, working with many aspects and different stakeholders simultaneously, and being interested in transformative change and openness for adaptation. It follows that looking at the effectiveness and outcomes of a developmental change of a system should be driven by the same assumptions (Virtanen and Tammeaid 2020). Using nonmeaningful measures in evaluation and performance assessment has also in itself had a discouraging effect on motivation and trust (Lowe and Wilson 2017).

It is important to evaluate transitions or systems change as dynamic learning processes where evaluation is an ongoing activity, guiding and redirecting the emerging change along the way. Enriching learning loops are a propellent of change and focusing on them enables transition. This is also an important step away from dualistic thinking and not taking into account that systemic interactions are reciprocal and nonlinear (Van Bavel et al. 2012) and affect the whole system both directly and indirectly. Systems thinking and systems change are hard for positivistic scientific thinking to internalize because of its adherence to the potential to define, describe, and master human self-organizing capabilities rather than appreciating and nourishing the human capacity to ride complexity and perpetually transform the patterns of system in a dynamic way. Echoes of this can be seen, for example, in the systems theory discussions raised by Burisch and Wohlgemuth (2016) and Cilliers (1998).

The discourse around the innovation capacity of organization has raised a distinction between incremental and disruptive change highlighting the importance of the latter. In a complex and ambiguous world, it is important to bear in mind that transitions with profound effects have a cross-sectoral effect and that the role of foresight, future thinking, and agile action is vital. From the perspective of systems change and meta-skills, there is though no conflict between incremental and disruptive change measures. Organizations and networks usually benefit from both. Creating and sustaining regular learning loops focusing on small changes, everyday innovations in working methods and learning cross-sectorally may not always produce disruptive innovations, but they do create and maintain the mindset of exploration and experimentation in the organization. They also lead to concrete small-scale changes which buttress the dynamic capabilities of the organization and can be crucial in archiving good results (Vermeer and Wenting 2018; Termeer and Dewulf 2018).

A further important addition in terms of positive psychology that the solutions-focused approach brings to accelerating systems change is its stress on positive deviations. Noticing strengths and positive development, modeling successes and expanding from them, and boosting positive feedback are all key competences for dynamic organizations and for successfully developing self-organizing human systems. Shifting the spotlight onto this positive core thus alters the prevailing view of change, and learning from being something hard, imposed, and external toward a natural way for a human being to be in the world and to be ready explores it. This is a difference that "makes a difference" in change making.

## Reshaping Leadership Training for a Complex World

The scholarly discussion around the appropriate and necessary forms of leadership development in the public sector has in recent times focused on behaviorally distinguishing effective managers from ineffective managers and on establishing holistic competency models (e.g., Hamlin and Whitford 2020; Skorková 2016; Larat 2016). It is well known that there are a number of policy issues that can no longer be addressed alone either by sector or nation-state, thus heightening the need for new kinds of dynamic and transformative capabilities able both to adapt and shape the environment (e.g., Kattel and Mazzucato 2018; Teece 2018; Bourgon 2017; Burischa and Wohlgemuth 2016; Meredith et al. 2016; Mau 2015). These findings indicate that a combination of coaching, classroom training, feedback, and experimental learning seems to have the best impact on leader

performance and organizational effectiveness (Seidle et al. 2016; Parry and Sinha 2007). Human-centered skills like empathy, ethics, participation, and design approaches are highlighted from the point of view of leadership interaction inside organizations and in achieving societal results (i.e., Quirk 2018; Van der Wal 2017; Bason 2017).

Delivering training that builds capabilities to enable action in a complex world calls for the giving up of the customary knowledge-gap approach from the trainer's side and looking past the notion of teaching as knowledge transfer from one person to another. Seeing training as co-construction between the participants shifts attention from teaching to learning and creates a positive learning spiral that has ripple effects, also on leadership culture in a broad sense and for interaction in real-life settings (Virtanen and Tammeaid 2020). The development of meta-skills via training can best be described as emergent learning meaning personal and collective empowerment, leading to new insights and greater action competence (Freisleben 2020, also Darling et al. 2016). Using innovative and mixed methods and supporting both individual and joint agency, competence, and resources help to overcome various meaningful challenges. It also means going over to learning design based on socially constructed mutual learning and building on peoples' experiences, ideas, intuition, and mutual sensemaking instead of relying on expert lectures to form the content. It is time to see that there is no science- or expertise-based solution to every problem and providing new knowledge by lecturing does not usually generate new kinds of actions.

Systems thinking has clearly been influenced by cognitive psychology which is portrayed as focusing on mental models needing change as a prerequisite for transformative change. That is one way to describe changes on the thinking and identity level. Enactivism and solutions-focused approaches remind us though that human learning and change are happening not only at the level of thinking but also at the experimental level (McKergow 2021), something which delivers an important message in terms of learning, training, and teaching. Solutions-focused training design constantly seeks links between large-scale endeavors and everyday behavior. With this combination it is a way to operate on several learning layers simultaneously and initiate learning, reframing-focused thinking, and action. It strengthens individual and joint meta-skills by broadening horizons, fostering dialogue, and joint sensemaking as well as learning by doing and putting ideas into action in real settings. This kind of training makes use of the previous skills and capacities of the participants, enhancing both individual and joint goal setting and building enabling mindsets. It is only when different kinds of knowledge are combined with skills and experiences in a manner deviating from how it has been done before that new solutions arise.

Training, the bringing together of multi-contextual groups, functions as an incubator of rearranging learning, discovering unpredicted new possibilities, and adapting learning and its outcomes to the individual needs of the participants derived from their personal backgrounds, situations, and aspirations (Jacobs 2017). A well-designed multi-contextual learning is not only about putting the cognitive pieces together but also about rearranging present and previous learning in such a way that it leads to new understandings and to new ways to be and act in the world.

An important part of learning is activities that take the learners to real service touch points: develop capabilities to develop competences to simply observe without an immediate need to categorize, judge, or decide anything; and gather multi-angled information to ponder and after that practice the new skills. Leadership training supporting the development of meta-skills is also designed as a process allowing time, space, and continuity for immersion, growth, and bewilderment which is also an important part of transformative learning. A well-designed learning process is far from linear and always an entity impossible to reduce to its individual parts either working or evaluated on their own. In a long learning process, a keynote or an intriguing viewpoint can look and feel very different when first heard and after some months of thinking and processing. Often, some at first glance irritating features prove to be the most

valuable ones in creating new kinds of thinking and action. Typically, a human being within a transformative change process is not really capable of evaluating their own learning in the middle of the process. When thinking expands to new levels however, the capability for assessment is increased (Virtanen and Tammeaid 2020).

## Conclusions: Synthesis and Further Research Agenda

The topic of this entry – public leadership meta-skills – is still a relative newcomer in both the academic and practice fields in respect of public leadership. Grounded in systems thinking and positive psychology, the solutions-focused approach, as well as distributed leadership theories, metacognition, meta-governance, and sensemaking, the meta-skills approach offers a fresh way to approach the ongoing challenges of public leadership.

Adopting a systems approach to change and the development of leadership meta-skills reduces the burden of leadership uniformity, i.e., finding one model, solution, or shared understanding of a situation. Instead, conceiving of society as a system introduces the need to agree on future goals in a way that different parts of the public policy system better relate to each other. Understanding complexities is a prerequisite for public leaders to work toward societal goals which make sense from their position and viewpoints. Instead of trying to funnel down a shared opinion or definition, the meta-skills approach underlines the variety of human perception and context and harnesses these layers of action to benefit a wider process of transition. Developing meta-skills contributes to the development of capabilities that can impact systems change by hosting, creating conditions, and interacting.

In order to increase the capacity of the decontextualized public administration to act in our complex world, three substantial shifts are required: from structure focus to human focus, from governance to collaboration (reaching out to new modes of meta-governance), and from knowledge transfer to co-creation. Developing meta-skills is a way for the public sector to learn new and fruitful ways to interact with the society and to transform its own ways of working. The problems and issues public leaders handle are often ambiguous, challenging, and evolving. This raises the questions of framing and interpretation which are decisive in addressing them. Moreover, from the point of view of nudging systemic and transformative change, meta-skills become central by enabling new ways of encountering, reframing, and understanding.

The emergence of meta-skills as academic and practical reasoning in the field of public leadership sets out a number of possibilities for future research. These for instance include a detailed empirical cultivation of the acquisition and deployment of meta-skills and coupling meta-skills as a mechanism for contributing, attaining, and achieving performance goals set for public organizations and institutions. Moreover, an interesting aspect that relates to leadership meta-skills development here concerns the supply and demand of meta-skilling – how these meta-skills development aspects are anchored in the curriculums of public leadership training and how public leaders feel about the demand to focus on them. In the long run, additional analysis will also be required in terms of identifying the structural and organizational ingredients that trigger the emergence of meta-skills deployment and, on the other, how government and administrative structures evolve in relation to the adoption and development of meta-skills as a key element in public policy and public administration leadership practice. Finally, further exploration of the specific meta-skills relevant in a variety of diverse organizational contexts merits thorough theoretical, conceptual, and empirical research.

# Public Management Models, Latin America

Conrado Ramos and Alejandro Milanesi
Universidad de la República, Montevideo, Uruguay

## Synonyms

Administrative management; Bureaucracy; Public management

## Definition

The administrative, institutional, and bureaucratic characteristics that countries in the Latin American region have been building since its consolidation as modern states.

## Introduction

Talking about a model of public administration in Latin America entails a simplification effort in view of the variety of countries with different governance structures, administrative systems, historical legacies, and ways of addressing public sector reforms over time. Also, it is debatable to what extent a Latin American "model" of public administration can be defined, understood as a set of administrative principles, in the sense of Hood (1991) that beyond its connections with other international experiences, and reflects a domestic development of its own. However, it is possible to identify a set of structural dimensions that, although with different features and graduations, have constituted the ground on which the models of public management and their successive (and numerous) efforts of administrative reforms at the regional level were registered.

An extended feature among Latin American public administrations is the coexistence of bureaucratic-Weberian models with patrimonialism and large-scale patronage practices. Although at first sight public administrations can formally contain all or most of the typical characteristics of Weberian systems (career systems inspired by meritocratic principles, separation of private and public means of administration, systems of registration for administrative acts, etc.), these hide practices that are extraneous to this logic. Thus, it is very common to find systems of recruitment, promotion, and remuneration of officials outside the meritocratic principles, as well as informal administrative practices inspired by secrecy and subjectivity rather than the impartial application of the regulation. In general, this means that the presence of legal-formal characteristics is not a sufficient condition to evaluate the degrees of institutionalization of public administration models, and even less their performance (Nef 2003). This type of bureaucratic "facades" is, moreover, especially frequent at subnational levels of government where the presence of local "*caudillos*" and the weaker controls reinforce the patrimonialism.

However, this coexistence is not only expressed through the presence of two rooted management logics (one formal and one informal) but also in some cases reflects a heterogeneous landscape depending on the area in question. While a state may contain agencies or offices with Weberian characteristics only in form, other areas may represent real "islands" where meritocratic appointment (whether under a career system or not), transparency in management, evaluation, and focus on results are the norm.

State reform processes from the 1990s onwards have accentuated this institutional schizophrenia, insofar as areas of the state understood as strategic (i.e., ministries of economy, central banks, state procurement agencies, etc.) underwent reform processes inspired by meritocratic principles, which "shielded" them from the typical evils of Latin American bureaucracies.

Associated with the aforementioned, public administrations in Latin America can be identified with what Ziller (2003) calls the "European continental model" as opposed to the Anglo-American model. The continental model is based on the normative principles of the German *Rechtsstaat* and the French *principe de légalité*. This model not only places the state in a central place of society but also the implementation of

laws and procedures as a means of providing regulation to both the public sector and a good part of social relations. Under this legalistic model, the bureaucracies develop a strongly hierarchical administrative culture associated with the strict following of rules and procedures. In cases where this type has expanded negatively, examples of bureaucratic ritualism can be noted, i.e., the irrational application of rules and procedures over their validity or utility. In any case, these types of models may present difficulties to generate processes of reforms of public administrations, to the extent that the changes can only be made through the normative modification that regulates them. Likewise, regarding the passage to management models that privilege or incorporate components of performance evaluation over the classical management of procedures.

All this presents a panorama of historical construction or path dependence that has not been neutral in shaping the reform processes experienced by countries, particularly in the twentieth century.

## Historical Construction of the Latin American Public Administration Model

The characteristics mentioned above need to be understood under a historical perspective that places them and gives meaning. Nef (2003) points out that public administrations have undergone transformations since the very creation of Latin American States whose stages could be divided into four: centralized construction of the state apparatus (1810–1850), limited institutionalization (1870–1930), early bureaucratization (1930–1970), authoritarianism (1970–mid 1980). To these periods could be added, at a later time, a stage of boom of neoliberal policies and application of models of new public management type (half of 1980s–2000s). Finally, at the beginning of the new century, a recent stage associated with the emphasis on the management by results trend and other innovations, all of them placed in a broader context of reforms inspired by the principles of transparency and access to public information.

### First Configurations of the Public Administration Model

The colonial legacy was characterized by the transplantation of mechanisms and ways of organizing the typical public administration of the colonizing countries, especially Spain and Portugal. This formed a first moment of imitation and ritualistic adaptation of rules and administrative patterns as an image of modernization. Associated with this, patrimonialism and patronage logics are also originated in this period. State positions did not respond to a meritocratic or neutral logic of state apparatus construction, but were rather reserved for specific social groups or as bargaining for political loyalties and other compensations (Nef 2003). This created a civil service reserved for the elites, at least in the higher layers, and an entrance to the public administration strongly dependent on the existing power correlations at the time. Yet, all this lived together with strongly formalist and legalistic attitudes.

Thus, looking further ahead, it can be pointed out that the processes of administrative reform in Latin America largely followed a center-periphery pattern. This not only refers to those pointed out by Nef (2003) about the imitation of practices of the colonialist countries but also during the twentieth century regarding the import of reform packages or management practices from the central countries. Even the international cooperation (USAID, United Nations, ECLAC, Ford Foundation, etc.) played a key role in the mid-twentieth century as a support for the generation of research centers and public administration reform processes. This derived largely from external induced reforms based on the idea of "administrative modernization" and later the "Washington Consensus" (Pérez Salgado 1997; Ramírez 2009).

The 1960s saw in Latin America the rise of the *New Public Administration* models influenced by the trends of the American public administration (Oszlak 2013). This approach of "administrative reform" predates the "managerial reforms" of the 1980s and 1990s and, although shares some of the critique to the state functioning and performance, it is not based on the idea of imitating the private sector business operative within the state apparatus.

This era was characterized by ideas about the growing inefficiency of the public sector due to excessive administrative rigidity and the high number of procedures that slowed down the public administration. This type of paradigm led to management innovations that sought to simplify the processes and times to increase the efficiency and productivity. This is how the organizing and methods offices, planning offices, program budgeting, and other areas tending to incorporate "science" into the public management were originated. However, this was not always able to break with the rooted bureaucratic ritualism of Latin American administrations. At the same time, the strongly legalistic approach generated, in some cases, an additional step to the established procedures rather than their simplification (Pérez Salgado 1997).

However, the cultural inheritance in Latin America and the period of dictatorships that followed in several countries obstructed an adequate cultivation of these ideas, even though its premises of decentralization, de-bureaucratization, delegation, and democratization will be flags that will be displayed little by little and will form part, subsequently, of the paradigm of the new public service.

## Public Management Reforms from the 1980s

Since the late 1980s and throughout the 1990s, most countries around the world embarked on public administration reform programs with different degrees of ambition. The main feature was the reduction of the state apparatus through policies of deregulation, decentralization, privatization, outsourcing, and reduction of personnel endowments. These reforms were called by the World Bank as "first generation reforms," predicting that a "second generation" of reforms would focus on the pending task of improving the state apparatus and its institutional weaknesses (Oszlak 2001).

First-generation reforms were being carried out in Latin America at the same time as they were built in the developed countries of North America, Europe, Asia, and Oceania (Mascarenhas 1993). A management model for the public sector called New Public Management (NPM) soon became the dominant paradigm worldwide. In its harder version (especially during the 1980s in countries of Anglo-Saxon tradition), this new paradigm, inspired by the neoconservative critique to welfare bureaucracies, will promote the shrinking of the state through privatizations and outsourcing. At the same time, and based also on a visceral distrust of the public sector, it proposes to incorporate into the domain of the public, tools, and logics of management imported from the private sector. The core assumption was that they are rationally superior to those of the public sector.

First-generation reforms in Latin America followed this trend associated with the rise of neoliberal policies and the "Washington Consensus." Privatizations, as well as the policies of deregulation and demonopolization of areas under state control, were also inspired by the idea that the free to choose is the best remedy for the corporate capture suffered by Latin American States.

While these reforms had success in stabilizing some key economic variables such as inflation and the reduction of the fiscal deficit that plagued several countries in the region, the counter face was a lower economic growth than expected. On the other hand, the improvement of the living conditions of the population was very limited. On the contrary, there was an increase in the level of poverty and a greater inequality in the distribution of income (Talavera and Armijo 2007). Moreover, Talavera and Armijo (2007) cite a study carried out by Eduardo Lora (2003), in which through a series of indicators they verify a certain "fatigue of the reforms" due to the growing distrust of citizenship in these pro-market reforms that would lift people out of poverty.

In the mid-1990s, in a good part as a consequence of the impulse made by the World Bank (Mainly through its 1997 report "The State in a Changing World" and in Latin America the work of Burky and Perry (1998)), the second generation reforms began to take shape. This second impulse did not contain the same level of orthodoxy as its predecessor; however, its common denominator was in need of sophisticated public management, in the context of a continent characterized by a strong presence of political patronage. A cohesive

state action was advocated that would begun by strengthening the administrative capacities of the public sector because without an intense use of public agencies, the stability of market reforms would be at risk. Ramirez (2009) points out that, despite some ambiguity in the second set of reforms, it is possible to distinguish some fundamental characteristics: (a) legislative reforms; (b) restructuring of public administration, especially at the central level; (c) renewal of the judicial system; (d) updating of regulatory capacities; (e) second stage of privatizations; (f) restructuring of relations between local and national governments.

Thus, this second wave of reforms has a strong emphasis on the institutional capacities. It calls for a "reinventing" to the role of the public sector through the strengthening of its regulatory bodies, but also the parliament, courts of justice, anti-corruption institutions, among others (Santiso 2001).

The reform of the public apparatus is also considered at the light of the economic performance. The institutional strengthening was seen as a factor for maintaining macroeconomic stability and growth. Hence the emphasis was placed on the institutions regulating the domestic economy such as the central banks, collection agencies, and others of similar characteristics.

In terms of administrative reforms, a key milestone in the reform process of the 1990s is the document prepared by CLAD in 1998, entitled "A New Public Management for Latin America" (*Una Nueva Gestión Pública para América Latina*). This document, very influential in its time, emphasizes in the reconstruction of state capacities and in the application of a management reform. While it was recognized that the processes in Latin America could not be a copy of the experiences of the NPM made in developed countries, it is also pointed out that in the region there were not Weberian administrations but strong patrimonialism behaviors. Nevertheless, it did not agree with the stage vision, of first realizing reforms of Weberians type and then go towards the NPM. This is because it was considered that bureaucratic-Weberian administration, adapted to the new context of a globalized and dynamic world, would not be efficient but self-referred, without the necessary capacity to adapt to citizen demands. It is proposed, then, to develop a model of public management inspired by the NPM but adapted to the characteristics determined by the political and cultural particularities of the continent.

The proposal at that time was based on the need to retake the Weberian concept of a highly professional strategic core but incorporating a more flexible organizational paradigm, as well as contractual tools specific to the private sector, and move towards a results-based management. The CLAD proposal has a strong inspiration in the positions adopted by Osborne and Gaebler (1993) in their famous book "*Reinventing Government*," where they reject the proposal of a minimal state but promote a more entrepreneurial one, which would not only adopt tools and logics of the private sector but reduce the interventor character in the economy, privileging the steering functions over rowing.

In a more or less orthodox manner, the Latin American public management reforms of the last 25 years have been influenced by these ideas, although perhaps it was only Brazil that formulated a program of reforms that explicitly recognized itself as a borrower of this paradigm (Bresser Pereyra 1998).

The structures of the public sectors in Latin America have also been flexibilized following the guidelines of the NPM, although not under a single pattern, and without studies that account for the situation at the regional level. At the level of the strategic core of the central administrations, administrative deconcentration has been accentuated, in order to separate the functions of policy design from the provision of services, in a sort of "agencification." However, there is no concrete evidence that this has led to a process of strengthening policy-making at the central level and a corresponding improvement in the efficiency of public service delivery, as advocated by NPM supporters.

Although it is not a phenomenon directly linked to the premises of the NPM, something similar has happened with the processes of functional decentralization towards subnational levels

of government, which boomed since the 1990s. As Nuria Cunill Grau (1995, 1997) affirms, these processes did not necessarily promote a more active participation of citizens and strengthened democratic decision-making mechanisms. Often, this was due to the fact that the strategic center of government was not adequately reinforced to lead and adequately evaluate these processes nor was the resources allocated so that the subnational levels could face the new challenges of functional and political delegation of services.

The Ibero-American Charter for Public Service (signed by all Ibero-American Presidents) was written in 2003. There, the idea of a professional administrative career is developed but within a framework of some flexibility. It is recognized as the need to reduce the margins of political patronage (as did the reforms of the Anglo-Saxon civil service in the late nineteenth century), not to create a homogeneous and rigid career system but for incorporating elements that would make it digestible for the politicians of the executive and more sensitive to the needs of citizens. An example of this is the proposal for the creation of a High Public Management position (*Altos Directivos Públicos*), as a layer of officials placed immediately below of the political hierarchies and outside the traditional public function with responsibilities for directing the implementation of government policies and the provision of public services. These officials, in terms of Hood and Lodge (2006), are under the logic of a public service bargain of a management type, as they access their positions meritocratically, their competencies are associated with the capacity to achieve managerial objectives, and their permanence in the position depends on the evaluation of the fulfillment of those objectives.

The introduction of this body of managerial officials in Latin America, unlike most reforms of this type in developed countries, does not mean replacing them in exchange for Weberian career officials. Senior public managers in Latin America would come to displace officials who had traditionally been designated politically, where their permanence depended on political trust rather than evaluations based on efficiency criteria. This explains, in part, the greater difficulty that the region has had in advancing in the constitution of professionalized systems of the High Public Management positions.

The incorporation of management contractual forms has also been a process that accompanied the managerial reforms of the last decades in Latin America. The legal figures vary depending on whether they are more formal contracts, in the case of privatizations and outsourcing of services, or when contracts are concluded between public sector organizations, with the predominance of management commitments. Management commitments are, in the logic of the NPM, a way of replacing the old forms of control of the classic paradigm of public administration by less direct forms of control, of managers and public agencies with greater margins of autonomy.

The successful implementation of the second generation reforms faced a set of difficulties that differentiate it substantially from economic reforms. General changes need many years of implementation to bear fruit with the difficulty of maintaining clarity and consistency in the long run. Economic reforms, on the other hand, are clear with respect to the final objectives and, as has been shown in the framework of structural reforms, can only be achieved with the consensus of the executive and within a framework of low interdependence among the actors. Institutional reforms require important coordination of social actors. For significant legal changes and sustainable improvements to occur, they must be based on a strong political consensus, resulting from an open and inclusive decision-making process.

## Characteristics of Administrative Reform Processes

Beyond the results, it is possible to identify a series of features that characterize the political economy of reforms in Latin America. That is, the way that changes are sought to be processed and carried out.

A particular feature is that much of the reforms are consolidated under enclave modalities. Reforms are designed in more or less autonomous spaces of political and bureaucratic interference,

created specifically for the task. Associated with this, reforms are often carried out by a relatively small group of officials with high specialization and influence over the political system rather than permanent officials of the state apparatus. These spaces have been, in many cases, transient to the extent that they respond to the political loyalties of a president or a party. Therefore, this logic of construction of technocracy associated with the reforms usually reproduces a discourse often adapted by international organizations and consultancies that consolidate a reformist ethos sometimes separated from the organizations and officials who seek to reform.

Enclave logic is not only represented in the design but also in the implementation. That is to say, the implementation of reforms does not usually take place transversally throughout the state apparatus but is usually associated with spaces understood as strategic, particularly those in charge of economic management, taxes, or public enterprises. In other cases, through the generation of agencies with greater degrees of autonomy, consolidating a civil service and managerial management processes, similar to some developed countries.

This consolidates at least two types of public administration within the same state. On the one hand, public organizations with modern management characteristics, good human resources and technology, that operate as "islands" within the state apparatus. On the other hand, institutions that remain unchanged in their patterns of patrimonialism functioning and inefficient or whose changes are given too slowly. This is the case for some basic public services or some subnational governments, particularly those in the poorest regions.

Reforms such as the civil service, judicial, or parliaments face rooted customs in the behavior of these organizations, such as clientelism, corruption, and organizational culture adverse to changes, considered in the language of the institutions as "informal rules." Likewise, the possible losses of power implied by the reforms for the actors that dominate the game obliges to reinforce the political consensuses and the negotiation processes which are extremely difficult to put in place and often pace down or restrict changes. Finally, these reforms require mechanisms to communicate and legitimize the changes that are undertaken, in the first place, to make visible the results that are not observed so clearly, as with economic reforms, and, secondly, to address the scarce levels of citizens' trust in the ability of governments to improve conditions and achieve higher levels of well-being.

## Latest Trends in the Reform of Public Administrations

In spite of the difficulties to make progress in management reforms, the logic of *results-based management* has been popularized (although with different results) in Latin America. This greater focus on results-based management or performance management has been established in several countries of the region, as in other regions of the planet, as a response to the more acute problems of the New Public Management model associated to the excessive emphasis on efficiency – produce services at the lowest possible cost – over effectiveness – ensure that policies meet the expected results (Modell 2005).

This type of approach has been widely promoted in the region by international agencies as a mean to improve the quality of policies in developing countries (CLAD 2010; García López and García Moreno 2010; Kaufman et al. 2015). In the same sense, the incorporation of modern public management tools into internal organizations (strategic planning, management and procurement processes, monitoring and evaluation of policies, etc.) has also been disseminated, in the tradition of the management trends of the NPM.

However, unlike the first and second generation of reforms, these initiatives are no longer characterized by being presented together with an ambitious paradigm of state and public sector reform but are recognized as instruments to deal with quality problems in public policies.

This new conception goes hand in hand with the explosion of e-government as the new revolution in public administration, as it allows a greater and better approach to the citizen while breaking

with rites and bureaucratic spaces of power (Dunleavy et al. 2006; Ramírez-Alujas and Dassen 2016). They are also driven by the possibilities opened up by the new information systems, together with the need to coordinate an increasingly heterogeneous and complex public sector, a discussion that was revitalized as a result of the greater fragmentation produced by the new public management. In this context, the countries of the region have been developing a strong interest in the strengthening of central government agencies. The renewed interest in policy coordination from the center became a relevant topic in academia and in international cooperation organizations (Alessandro et al. 2013).

It remains to be seen whether these ongoing transformations may constitute a new management model, similar to what some have identified as "*intelligent public governance*" (Criado 2016). Some Latin American governments have made progress in the creation of policy laboratories based on social platforms that contribute to the formation of co-creation networks of policies with the citizens. These practices are closely associated with the agenda of the "*new public service"* (Denhart and Denhart 2007), as a democratic political theory that proposes the rescue of citizens in their role of users or clients and the strategic repositioning of the public sector and its management model.

# Public Management Reform in Latin American and Caribbean Nations

Alvin H. Brown
University of Texas, Arlington, TX, USA

## Introduction: The Development of Public Sector Management Reform in Developing Countries

Public management is concerned with organizing public sector institutions to provide services effectively and efficiently. A continuing challenge for many developing countries during the last four decades has been an increasing demand for more services, reduction of poverty, and economic growth. These phenomena made the state responsible for redistributing wealth and providing social welfare programs. Underdeveloped infrastructures, competition for scarce resources, and a dysfunctional private sector moved developing countries to take on the responsibilities of providing much needed employment for the growing professional and middle classes. Consequently, government expenditures increased precipitously. For instance, between 1960 and 1979 public consumption as a percentage of gross domestic product rose from 7% to 20% in Jamaica, 6% to 12% in Mexico, and 9% to 15% in Trinidad and Tobago (World Bank 1981). The international debt crisis of the 1980s brought more attention to many of the developing countries' inability to service their debts as a result of their growing government size and the unclear role of their public institutions.

In many developing countries, governments were criticized for their inefficient and ineffective delivery of public services. These public management failures were the result of fiscal irresponsibility and a certain level of political unaccountability. This lack of accountability stemmed from their legacy of colonialism which was reflected in a centralized and authoritarian government (Burrows-Giles 2002; Haque 1997). The unsatisfactory performance, criticisms, and fiscal mismanagement of the public sector institutions served as the catalyst for public management reform in many developing countries. In numerous developing countries, the public sector usually serves as the example of organizational governance and politics. Accordingly, it is the driving force of reform even though its institutions are often the object of public management reform. Developing countries are faced with constantly changing global socioeconomic and political environments. As a result, it is incumbent on these countries to recognize their growing need for a more dynamic and malleable public sector focused on the continuous improvement of the public management and organization of their public sector enterprises.

## The Field of Public Management

The origins of the field of public management are quite elusive to identify. Lynn (2003) suggests that the founding of public management might start with any of the following statements:

1. The contemporary study of public management has its origins in America during the 1970s, in the curriculums and research of the new public policy schools and efficiency driven managerial reforms originating in Britain and New Zealand.
2. What is now termed the field of public management has its roots in the scientific study of the modern administrative state in America

beginning in the late nineteenth and early twentieth centuries.

3. The origins of the field of public management are found in a systematic study and practice of cameralism which began in the seventeenth- and eighteenth-century Germany and Austria.
4. The field of public management is rooted in bureaucratic government and administrative doctrines in ancient China and in medieval regimes in the Orient. The term public management refers to a major segment of public administration or public affairs, which encompasses organizational structures, managerial practices, and the institutional values of public managers that implement the will of the sovereign authority (Lynn 2003).

## Public Enterprise Management in Developing Countries

In the developing countries of Latin America and the Caribbean, public enterprises are the main drivers for economic and social transformation. The concept of a public enterprise system is that governments sell goods and services to the general public; such enterprises consist of private, public, and nonprofit management features. Many of the challenges facing public enterprises, such as maximizing efficiency (which is an element of the marketplace) while maintaining the ideals of equity and politics of the government sector, necessitate the interpretation of politics and the market. Gaining an understanding of the past and present issues surrounding public enterprises in Latin America and Caribbean Developing Nations (LACDNs) is useful when interpreting the public enterprise as an infrastructure of development in different environments. Thus, the social and economic environment in which public enterprises were established and operate today influence the efficient and effective performance of the enterprise (Farazmand 1991, 1996). The performance of many public enterprises can be directly associated with colonialism's influence on public enterprise management and service delivery.

## The Forgotten Factor: How Colonialism Influenced Public Management

To better understand public enterprise management and to reform it in Latin America and the Caribbean, it is essential to be aware of how colonialism influenced public enterprise management. Farazmand (1994, 1996) argues that colonialism was instrumental in the development of public enterprises around the world. European colonial powers, including Britain, France, Portugal, and Spain, have left a lasting imprint on the administrative systems of many African, Asian, Latin American, and Caribbean nations. The development of public enterprise management and economic systems in Latin America was a product of the mercantilist Spanish and Portuguese prevailing colonial rule in the region which persisted after independence (Farazmand 1996). Thus, many independent states of Latin America adopted the administration and economic patterns that they were exposed to during the colonial period.

The legacy of colonialism in developing nations is one of the prevailing features evident in the management of many government agencies. In other words, the end of colonial rule in many Latin American and Caribbean nations has not changed the colonial traditions regarding government bureaucratic structure, function, socialization, norms, and attitudes. Colonial domination in the region resulted in British business interests gaining power and wealth through the policy of mercantilism. The impact of mercantilism on the region was manifested in very specific policies, (1) preventing colonial people from establishing manufacturing industries making them non-manufacturing dependencies, (2) keeping colonial people technologically backward, (3) maintaining colonial people as producers of primary products, (4) keeping colonial people bound to the mother country through the policy of trade exclusivity, and (5) limiting horizontal linkages between the colonies except through the British government.

The obvious impact of mercantilism on the region was twofold. First, policies were designed to extract the surpluses from the region to help in the development of Britain; second, it distorted and impeded the development of the economies in

the region. In fact, the colonial legacy has not been totally dismantled. This is apparent in the Crown Colony Government representative system of the Grand Cayman Islands. The inherited pejorative features of bureaucracy, such as elitism, paternalism, despotism, distrust, centralization, secrecy, formalism, and urban bias, are alive and well in the Grand Cayman Islands.

There are three stages to the historical evolution of colonialism. First, the era of slavery lasting until 1834 in the Commonwealth Caribbean served to place a premium on freedom and the political culture of the Caribbean. The second stage was the old representative system until the 1865 Morant Bay uprising in Jamaica. Subsequently, the Crown Colony Government (CCG) form of government was introduced to devolve government oversight from the imperial British government to the colonies. Third, the era of constitutional decolonization began with the general rise after the First World War toward greater self-government and eventual independence (Burrows-Giles 2002; Lange 2004).

The development of colonialism was not a random event but was purposeful and conducted with extreme prejudice. At the national level of the British government, the privy council was the chief executive authority for the local service in the colonies. Other offices included the Treasury, the Office of the Secretary of State, the Admiralty, the War Office, and the Ordinance Board. As a result of complications with management and delays in long distance correspondence between Britain and the colonies, a colonial office was formed in 1854. The colonial office ensured the provision of a permanent supply of trained officials to manage and coordinate the duties of the colonies in the best interest of the Crown. Maintaining control of administration was important to the perpetuation of colonial rule because the colonial Administrative Secretariat did the bidding for the Crown and discharged its functions according to the standards set by the Crown. What is clear is that the Crown Colony ruled its colonial possessions by eliminating political competition and vesting government management and decision-making power in the supreme ruler (governor) of the Crown Colony Government.

The introduction of colonialism into the public management system of the Caribbean was based on value premises and structural designs transferred to colonial settings incrementally (Benn 2004). Colonial rule was easily adopted because no other choice was readily available. The adaptation of this type of rule by public-enterprise management at the local level was the result of colonial rule becoming institutionalized, not just based on acquiescence, selective recruitment, organizational socialization, value infusion, or conformity but also on control, coercion, and containment. Accordingly, the hegemonic dominant class of the Crown Colony became the driving force of consciousness, values, and customs throughout colonial societies (Lange 2004). Eventually, the inquiry of the Moyne Commission Report (1945) and other social movements brought about change in public management with increasing involvement and participation in public agencies by majority socio-ethic groups. Greater acceptance of and recognition for the instrumental value of public management became visible, especially, with the new responsibilities of public agencies to deliver services to the masses.

## Ascendancy of New Public Management

Over the past 25 years, traditional public administration has experienced a shift in values and norms. One such change has been the ascendancy of a concept which has been called the new public management (NPM). In discussing public management reform, one should consider the suitability of the new public management (NPM) movement across developing countries. Many Latin American and Caribbean countries adopted the style of NPM that involves the treatment of citizens as customers and a market-based approach to service delivery. Popularized by the analysis of Hood (1991) and Dunleavy and Hood (1994), new public management consists of seven essential traits: (1) active and discretionary professional management, (2) the focus on explicit standards of managerial performance, (3) greater emphasis on output controls, (4) shifting to disaggregating of units in the public sector,

(5) encourage greater competition in the public sector, (6) emphasis on private-sector methods of management, and (7) emphasis on greater discipline and parsimony in resource use. Hughes (1998) defines NPM as a program of public sector reform designed to supplant administration with management, operating bureaucracies like businesses and reducing the size of the public sector. Scholars argue that NPM constitutes a move away from the dominant paradigm – what they label Progressive Public Administration in two directions. First, it is lowering the concentration of rules limiting the freedom of public officials handling resources (money, staff, contracts, etc.), and second, it is removing the barrier between the public sector and the private sector in terms of personnel, structure, and business methods (Dunleavy and Hood 1994).

New public management is often used to respond to certain pressures encountered by government, including shrinking budgets and the effects of globalization. The common responses to these pressures include deregulation of line management, performance-based accountability, and contracting out. It can be debated that public management reform should focus on management activities, such as training, accountability, and performance measures within the public enterprise to improve performance, rather than just outcomes and results prescribed by new public management. A body of literature offers a counter argument related to the merits and suitability of new public management and argues that governments in Latin American and Caribbean developing countries may be ill equipped to take on unfamiliar approaches to declining services because the institutional conditions needed to implement new public management practices may not be present, particularly, in developing countries.

In his critical analysis of NPM, Lynn (1996) points out that many tenets of New Zealand and British reforms, including the emphasis on program outputs, have been widely tried and, to a certain extent, abandoned or absorbed into administrative practice in a less radical form in the United States. Drawing from the history of reform practice and ideas in the United States, Lynn (1996) is skeptical about claims of NPM proponents that NPM constitutes a new paradigm about the role and functions of the government. Some see NPM as a new paradigm because it constitutes a move toward a post-bureaucratic, commercial, contractual state rather than a technique and implementation-oriented subset of public administration. Others argue that it constitutes a new paradigm because two epistemic communities (traditional public administration and new public management) are engaged in a dialogue within but not among their respective communities. Lynn (1996) argues that if a community of practitioners and academics (if there is a community) does not have an accepted theoretical cannon and accepted methods of application, they can hardly claim to possess a paradigm, even if the arguments are couched in some general meta-language. Questions about the paradigmatic nature of NPM are raised by Aucoin (1990), who convincingly shows that NPM introduces contradiction with regard to three essential issues of public management: (1) different ways in which the bureaucracy problem is diagnosed and the remedies prescribed, (2) the different understandings attached to policy/administration dichotomy, and (3) different approaches taken to the representation/responsiveness problem.

Advocates and critics of new public management agree that it has universal appeal as a catch phrase; nevertheless, there is literature that indicates many LACDNs have adopted only a few elements of the new public management agenda. The real question is can the new public management reform be called a dominant paradigm of public service reform in the developing world. Polidano (1999) argues that one may agree that new public management is a dominant paradigm if all one does is to look for new public management style reforms. Hood (1991) reasons NPM emphasizes a certain set of values over another set of values. NPM, according to his analysis, emphasizes what he calls Sigma-type values (purposefulness, frugality, efficiency) while assuming Theta-type values (honesty, fairness) under certain structures, and almost ignoring Lambda-type values (resilience, robustness, survival, and safety). The problem is that no matter

how strong the political emphasis on certain values might be, the government cannot completely forgo democratic values. Traditional public administration has evolved, and a review of recent books on public administration and public management easily points to the distinction between them and reveals that public management is, in fact, a part of public administration. Essentially, the problem was misconstrued when the issue of competing values was seen as the demise of old administrative values. Actually, values can surface in different combinations and configurations, and the task of the student of public administration/management should be to examine how these alterations impact administrative behavior and outcomes. An analysis of selected volumes on public management and administration shows that differences are of degree and that the lines between the two are to some extent blurry. Given these circumstances, consideration should be given to innovative elements of the NPM reform model that would blend traditional- and market-based theories to provide a means to improve the financial and operational performance of public enterprises in developing countries.

After experiencing many decades of inefficient, ineffective, and poor performance of public enterprises, governments globally have seriously considered and even embraced privatization. Thousands of public enterprises (PEs) have been turned over to the private sector in Latin America, the Caribbean, Africa, Asia, and Eastern and Western Europe. This trend was spurred by the documented poor performance and failures of PEs and the efficiency improvements after privatization around the world.

## The Business of Airport Public Enterprises

Airports are essential to the societal and economic growth of Latin America and the Caribbean island nations. Most Latin American and Caribbean countries have one or more airports that serve tourist, business, and general air transportation needs. During the past two decades, many governments of Latin America and the Caribbean have experienced fiscal crises that stalled the necessary investment needed to improve and maintain their national infrastructures critical for participation in global markets. Interestingly, although airports are one of the main infrastructures promoting growth, these public enterprises receive little attention from government officials regarding maintenance and improvement (Doganis 2002).

Airports no longer fit the traditional model of past years because they have evolved into multifaceted operations. They have hotels, conference centers, shopping malls, as well as a range of facilities and services for airlines. Consequently, there are multimodal hubs that host a variety of economic activities. Furthermore, various types of public-private ownership and operations management exist. The characteristics of an airport under public ownership and operations include (1) public airport ownership and operations managed by a government department, for example, a ministry of transportation, and (2) public ownership and operations operated by an airport authority with no private management involvement in ownership and operations. The characteristics of an airport under private may consist of several combinations of ownership and operations. For instance, an airport may have public ownership with management and operations contracted out to the private sector. Another ownership structure not regularly utilized is private ownership and operations. This aspect of ownership means full divestiture of the airport assets that countries are unlikely to do.

Revenues derived by airports are classified into primary sources, such as aeronautical or airside and non-aeronautical or landside activities. Airside revenues result from airport traffic activities related to the operation and landing of aircraft, passengers, or freight. Landside revenues are obtained mainly from non-aircraft-related commercial activities in terminals (e.g., shopping, restaurants, car parking, and car rentals) and rents from airlines and concessionaires. Landside revenues also can include nontraditional activities, such as hotel operations, real estate development, and consulting services.

At several airports, specialized concessionaires who pay concession fees and rents to the airport authority operate commercial facilities. Commercial sources of revenue improve operational performance, increase resiliency to cyclical economic conditions, and minimize airline dominance. In the past, airport officials typically focused on operational functions, such as baggage handling, and paid little attention to passenger food and shopping needs. At most government-owned airports, the concentration of commercial revenues has been limited to a small selection of duty-free shops and restaurant facilities and has been reduced due to the deregulation of duty-free facilities (i.e., the advent of in-flight, on arrival, and in-city duty-free shopping). A number of airports are beginning to shift from traditional "public utility management" to a more commercial perspective in response to changing market conditions. Diversifying revenues is one of the major challenges facing airport managers as governments are increasingly unable to meet their airport financial obligations (Graham 2003; Kapur 2003). An example of this new philosophy can be found at Sangster and Cancun International Airport which has developed many different boutiques and culturally focused retail shops.

In the early 1980s, the idea that public airports could be privatized would have been considered out of step with the mainstream and uninformed about the subject. However, today, the privatization of airports is a means of survival for many developing countries. Airports have become an integral part of the air transport and infrastructure needs of developing countries. There are many reasons why governments make the decision to privatize their airports; they include efforts to curtail mismanagement and corruption in airport administration. However, the single most common reason is the inability to fund and obtain adequate financing for airport development and upgrades.

The concept of airport privatization centers on the infusion of capital by the private sectors to gain partial or total control over the public enterprise. Airport privatization was the first of many privatization reforms introduced by Margaret Thatcher when she privatized the British Airport Authority in 1987 by public offer of $2.5 billion. Since its privatization, BAA has not failed to post profits for its shareholders in its management of seven major airports in the UK. BAA is currently listed on the London Stock Exchange and has a market capitalization of $8 billion.

The traditional approach to airport privatization was the sale of the British Airport Authority (BAA) in 1987. In addition, deregulation and privatization policies in large measure have been driven by disenchantment with public sector performance, fiscal crises, and technology changes that have increased the scope for competition. Privatization has been achieved by changes in management, capital, or ownership structures of the entity. In the airport sector, the use of privatization techniques is limited with no single model emerging. To date, the range of approaches includes divesting an entire airport system, individual concessions, long-term leases, and joint ventures. Although not limited to developing countries, the most common technique for airport privatization involves some variation of a Built--Own-Transfer (BOT) and/or management contract. These schemes are site specific with long-term concessions and the transfer involvement of operational functions to a private sector operator.

## Conclusion

The 1980s ushered in the internalization of public sector management reform because the overall performance of the public management system in Latin America, and the Caribbean exhibited minimal improvement over the years. Moreover, public enterprises were the beneficiaries of this lack of management effectiveness. The need for public enterprises to improve their performance, public management capacity, development strategies, political inclusiveness, and political and economic stability is an indication of the increased importance developing countries have placed on improved public enterprises performance as a major part of their national development.

The need to create an environment of improved performance by public enterprises gave rise to public sector management reform in Latin

America and the Caribbean. Consequently, this opened the doors for a reform movement during the 1980s called new public management. NPM focused on government efficiency utilizing market-based strategies. Put another way, it employed an entrepreneurial approach to public administration. Unlike traditional public administration with a focus on rules governing the processes used by government agencies, NPM is result oriented. Accordingly, citizens are viewed as customers who have the right to decline government services if they are dissatisfied. Last but not least, NPM is characterized by contracting out and privatization of services while the public manager is given more discretion in deciding how policies will be implemented. In today's changing environment, airport business is going through unparalleled changes by way of privatization in an attempt to better serve the public interest (Haque 2000).

Healthcare service; National Health System; Social welfare system

## Introduction

The *social welfare* system is the set of actions carried out by the State to guarantee minimum services to the population through a system of social protection. The origin of the modern welfare state is located in Europe and is based on the principle of contribution, which obliges workers to finance the social welfare system. The four pillars of the welfare state are: health care, social security, education, and social services.

Health care is based on a free universal system or on the financing of services, to a greater or lesser extent, by citizens. Social security offers coverage to the population through contributory pensions for retirement, widowhood, orphanhood, or disability. Education is compulsory and universal to some extent and is subsidized at higher levels. The social services assist in situations not covered by the benefits of contributory aid, such as dependence.

The social assistance system plays an important role in protecting the health and socioeconomic well-being of citizens. Social inequalities imply inequalities in health. In this respect, the *expenditure approach* confirms that social and health expenditure reduces health inequalities (Álvarez-Gálvez and Jaime-Castillo 2018).

## European Models of Social Welfare Systems: Bismarck Versus Beveridge

With the Industrial Revolution of the eighteenth and nineteenth centuries, the worker found himself in absolute powerlessness in the face of social risks and contingencies. It was Otto von Bismarck who presented to the Reichstag in 1883 a project of compulsory accident and health insurance, for the protection of workers in the industry, on an obligatory basis, against the risk of illness and the contingency of maternity. As a result, the Sickness Insurance Act was promulgated in Germany in 1883, the Occupational Accidents Act in 1884, and the Disability and Old Age Insurance Act in 1889. Thus, German local governments set up sickness funds requiring workers to pay compulsory contributions to receive certain benefits in the event of illness.

By the beginning of the twentieth century, the evolution of primitive capitalism gave rise to the modern welfare state. Saving was no longer beneficial to the economy, as mass consumption became the root of development. If citizens did not need to save to secure their future, consumption would increase. Therefore, if the state insured citizens against the risks of illness, disability, unemployment, and old age, individual savings would no longer be necessary and the economic capacity of citizens would be used for direct consumption, revitalizing the economy. This social security system, with the State as benefactor, has been called the welfare state, and one of its main theorists was the economist J. M. Keynes.

In 1941, the British House of Commons ordered a Commission, chaired by Sir William Beveridge, to study a social security system for the reconstruction of the country after the war. The so-called Beveridge Plan established three provisions for successful protection (Ruiz Medina 2011):

- The state must provide subsidies or family allowances to persons who care for children until the age of 15. If the school-age is extended, to 16.
- Healthcare service must ensure all preventive and curative medical treatment to all citizens without distinction, without income limits, and economic barriers.
- The authorities must ensure the continuity of work, avoiding collective unemployment.

The real innovation of the Beveridge model was to coordinate the application of these three methods already known, but so far used separately. Besides, the Social Security Plan proposed by W. Beveridge combines three different approaches:

1. Social security: it carries with it the principle of solidarity and it is intended to cover the basic needs. It is of a contributive and obligatory nature, being imposed by the State, which guarantees that future generations will be in charge of covering the contributions that serve to cover the current insured, so it does not require the creation of public reserves.
2. Assistance at a national level: in exceptional cases of need, even if the contributions have not been paid in advance, the Treasury ensures free medical assistance to the entire population, both in terms of prevention and treatment.
3. Voluntary insurance: in this type of insurance the insurance premium is precisely adjusted to the risk; by paying contributions from an early age, reserves are accumulated to cope with the risks and adversities of future old age.

Therefore, the Beveridge report suggests a comprehensive social security system that covers all citizens, not just employees, for those needs that are common to all: retirement and medical treatment.

In Bismarck's Social Security Model (SIM), coverage depends on the individual's employment situation; it consists of multiple insurance plans, with the administration being a mere manager; and financing depends on contributions from the insured, the employer and sometimes the State. On the contrary, the Beveridge National Health System (NHS) tends to universalization, since protection is derived from the generic situation of need; there is a unified and public administrative management, with the State offering all services; and financing depends solely on the public budget.

In the SIM, citizens enjoy health care through private organizations, and to this purpose, both employers and employees pay fees that go directly to the companies that manage the medical services. The State is more of a regulator of services. However, the NHS is regulated by taxes and both services and benefits are controlled by the State.

Depending on several variables, such as the degree of social protection or the distribution of weight in the provision of services between the public and private sectors, we find in Europe four different models of the welfare state, which is shortly analyzed below.

*Nordic model* is applied in Denmark, Norway, Sweden, Iceland, and Finland. It is the model with the greatest social protection. Benefits are financed by contributions, and the State is the main provider of services, with high quality standards. It is based on the principle of citizenship, which implies widespread access to the population. The healthcare systems of the Nordic countries are also very similar. Health care is almost entirely public, financed by high taxes, and almost all hospitals are publicly owned and operated. The primary care sector is quite essential, and people need to see a general practitioner before they can see a specialist.

*Continental model* is applied in Germany, Austria, France, Belgium, Holland, and Luxembourg. It is based on the contributive principle, so that employees and companies are obliged to contribute to the creation of a plan for the prevention of social needs. It also offers noncontributory benefits and subsidies, some of which are not even subject to a commitment to reintegrate into the labor market. Compulsory public or private insurance funds finance health care in these countries. Sometimes, health care is partially financed from general taxes. In Belgium, for example, the state subsidy is high, while in Germany only 21% of the funds come from general taxes.

*Anglo-Saxon model* is applied in the United Kingdom and Ireland. Social protection, both at the level of contributory benefits and social assistance, is more limited. They cover basic needs and delegate to the responsibility of individuals the complete coverage of their needs. The criteria for granting aid and subsidies are stricter and subject to active employability actions. The health service is mainly financed by general taxes. The British NHS has grown to become the largest publicly funded health service in the world and is considered to be one of the most efficient, egalitarian, and comprehensive.

*Mediterranean model* is applied in Spain, Greece, Italy, Portugal, and Turkey. It is situated between the Anglo-Saxon model and the continental model in terms of aid and the role of the State in the provision of services. It is based on cultural peculiarities, such as the presence of the family in the life of individuals, attributing to it the coverage of needs that in other models are covered by the State, such as the care of children or the elderly. It is similar to the continental model, but the labor market is not very flexible due to labor protectionism. However, this model is not very efficient in reducing poverty. Welfare is mainly directed toward generous state pensions and early retirement as a means to improve working conditions. As a result, the level of social assistance is much lower than in other countries.

Regardless of the model applied, the countries of the European Union essentially offer universal coverage of health expenses, guaranteeing the rights of patients to secure high-quality health care in all countries.

Another great health model is that of the United States, but it is a totally private system.

## Patient Satisfaction as an Indicator of the NHS Quality

European health systems are based on the principles of universality, solidarity, and equity. The tight budget available to governments restricts spending on various public services, including health care, which can negatively affect citizens' satisfaction level regarding the healthcare system. The NHS has three main objectives: to improve the health of the patient, to optimize the patient's experience, and to carry out management by making the best use of resources. This poses a major challenge to managers, who have to cope with increasingly demanding demand, rising costs of technology, and resources that are not only limited and scarce but are often reduced by economic crises. The system is complex and there are many factors to be taken into account, making it difficult to manage.

Citizens are increasingly demanding better health care as a necessary condition for improving their living standards, so the primary concern of patients is to improve the quality of health care. Therefore, the quality of medical services is critical to patient satisfaction and, consequently, patient satisfaction is considered the best indicator to measure, evaluate, and improve the quality of health services (Chang et al. 2013). In this sense, in the European Model of Quality Management of the EFQM (European Foundation for Quality Management), the customer satisfaction (patient, in health) represents 20% of the total value, while the International Organization for Standardization (ISO) considers the opinion of the users fundamental in the evaluation of the quality of the health services.

In general, the opinion of the patient on her/his level of satisfaction is considered a solid indicator of the quality of the attention received and it has the advantage that it allows to evaluate the improvement of the quality resulting from the management decisions. Higher quality is identified with higher patient satisfaction (Aliman and Mohamad 2016). Health care is a sector where low quality has serious consequences, so the clients (patients) are more intolerant of low-quality service than in other sectors.

Patient satisfaction analyses should provide information to both health professionals and health system administrators. The surveys of satisfaction of health services provide useful information on the development of policies to be carried out, which should aim at the implementation of evaluation and quality improvement programs, aimed at maximizing patient satisfaction at the lowest possible cost (Vogus and McClelland 2016), and always thinking about patient-oriented structures (Agosta 2009).

Furthermore, several studies have found that resources explain a fundamental part of patient satisfaction. In particular, the number of hospital beds in operation has a decisive weight, while the number of posts in the day hospital has a negative influence. This fact implies that the citizens prefer their health problems to be solved as inpatients rather than outpatients. Other resources are significant, such as the number of hemodialysis equipment (which are indispensable for the survival of individual patients) or the number of computerized axial tomography equipment. However, the most highly assessed variable is the number of medical specialists, which implies that hiring more specialists should be the primary objective of health policies (Valls Martínez and Ramírez-Orellana 2019). Hospital safety is also a fundamental variable that must be approached by the health authorities. It is interesting to observe how higher spending on medicines increases satisfaction, but only in patients over 65 years of age (Pascoe 1983). In younger patients, the use of alternative therapies is more valued (Valls Martínez and Parra Oller 2019).

## Health Expenditure: A Quality Differentiator

Spain represents a unique case, since the public NHS and the private health system coexist side by side so that private health services are a complement to public health services. Thus, those who pay for private insurance do not cease to pay for public health, that is, they pay twice as much. Moreover, it is also unique because there is no single NHS. The Spanish national territory is

divided into 17 autonomous communities, and the competencies in health matters are transferred from the central government to the governments of the respective autonomous communities. Thus, there are 17 NHS, each with its own particular health policies.

The autonomous governments are led by political parties from a different wing, which translates into very different policies in terms of public spending, that is, the amount invested per inhabitant. There are significant differences within Spain. Therefore, the study of the Spanish case is significant and revealing of what would happen if we transfer it to the different policies and amount of expenditure between the different countries of the European Union.

A cluster analysis (Jutz 2020) has been carried out based on health expenditure per inhabitant and patient satisfaction in the different autonomous communities, considering the analysis period 2005–2018. In this way, it has been possible to evaluate the quality of the health system in terms of the expenditure invested. Figures 1 and 2 show the results obtained, which reveal two groups: those communities that spend more on their healthcare system and have better health care, and those that spend less and, consequently, offer lower levels of quality health care.

## Conclusions

Different European countries address the social and health needs of their citizens in very different ways, although the health coverage of the population, in general, is mainly provided by the State.

**Public Management Resources of the NHS, Fig. 1** Hierarchical cluster analysis: Dendrogram based on Ward's linkage

P

**Public Management Resources of the NHS, Fig. 2** Pooled scatter. Ward Method

The Nordic countries provide the best benefits and services to their citizens, while the Mediterranean countries offer the least coverage. Concerning the health system, as with any other service, citizen satisfaction is a reliable indicator of its quality. Studies have shown that the most valued part of the system is the human team, especially the specialist doctors, above the family doctors and nurses. Therefore, health managers should invest more in specialist doctors, as well as in facilities and health security. Finally, the cluster analysis centered in Spain finds that those regions that apply policies of greater health expenditure per inhabitant present health systems of greater quality, as it is perceived by citizens.

# Public Organizations and Nonprofit Organizations

Jiahuan Lu
School of Public Affairs and Administration, Rutgers University-Newark, Newark, NJ, USA

## Synonyms

Government-nonprofit interactions; Government-nonprofit relations

## Definition

Nonprofit Organizations as Gap Fillers: Nonprofit organizations provide public goods and services that government fails to provide to citizens.

Nonprofit Organizations as Third-Party Partners: Nonprofit organizations collaborate with government and deliver publicly funded goods and services to citizens on behalf of the government.

Nonprofit Organizations as Policy Advocators: Nonprofit organizations engage with government agencies to influence public policy and government practice.

## Introduction

The nonprofit sector contributes to democratic governance in numerous ways. For example, nonprofit organizations deliver basic human services, engage in community building, organize for social changes, and provide spiritual fulfillment. While performing these critical functions, nonprofit organizations inevitably have to interact with government in various occasions. This entry attempts to delineate government-nonprofit relations in a democratic society. Indeed, the interactions between government and the nonprofit sector are far too complex to be summarized into one dimension. Rather, nonprofit-government relations are often considered as a multidimensional construct (Young 2000). This entry suggests that nonprofit organizations can interact with government, broadly speaking, in three ways: as gap fillers, as third-party partners, and as policy advocators. The focus of this entry is on charitable nonprofit organizations whose major function is service provision. The following sections elaborate on each strand of government-nonprofit relations and review relevant documented evidence.

## Nonprofit Organizations as Gap Fillers

The notion of nonprofit organizations as gap fillers suggests that nonprofit organizations come into being because they can provide public goods and services that government fails to provide to citizens, largely due to demand heterogeneity and majority voting (Weisbrod 1986). As a society grows more and more demographically diverse, diversified population would ask for diverse public goods and services, in terms of quality, style, and level. As such, citizens expect their

governments to be more responsive to the needs of diverse groups and ideally tailor public goods and services to these diverse demands. However, this creates a dilemma for the government. On one hand, the government could not respond to the preferences of all the constituent groups in local communities. Often, these diversified goods and services are only desired in accord with local preferences and consumed in local communities. These local collective demands might not be large enough to be addressed by government intervention as a public policy issue.

On the other hand, probably more fundamentally, public officials and political leaders in a democratic society, in order to maximize their chances of reelection, will ensure that public service provision is at the level that most voters prefer, leaving other service needs unsatisfied in the public policy process. In sum, whatever public goods and services government provides to its citizens, the government inevitably fails to meet the desire of some portions of citizens, resulting in government failure in the provision of public goods and services. In this way, nonprofit organizations can function as gap fillers, to meet the service needs that are ignored by government.

Indeed, nonprofit organizations' defining features make themselves better positioned to fill the gaps left by government provision of public goods and services. As grassroot community-based organizations, most nonprofit organizations are deeply embedded in local communities and thus have better understanding of local needs. Also, compared to government, nonprofit operations are subject to less bureaucratic control and political oversight and thus could be more flexible and efficient to respond to social and community issues. Indeed, in many social welfare service areas such as HIV/AIDS and domestic violence, nonprofit organizations historically took the initiative in addressing pressing problems and leading social changes, usually preceding government programs and policies. Again, in the United States, states with higher degrees of demographical heterogeneity tend to have more nonprofit organizations to deliver human services (Lu 2016a). In sum, nonprofit organizations are more readily to tailor goods and services to local situations, permitting a greater diversity of goods and service provision that government itself could never achieve. In this way, nonprofit organizations, supported by charitable donations and voluntary activities from private sources, could act as a supplement to government.

Following this line of reasoning, the size of the nonprofit sector in a given geographical region is determined by the heterogeneity of population demands in that region, often represented by the heterogeneity of the population. Thus, there exists a positive relationship between the number of nonprofit organizations in a jurisdiction and the degree of population heterogeneity in that jurisdiction. As Weisbrod (1986) wrote, "the larger the quantity of collective good demand that is undersatisfied at the tax price scheme used by government, the larger the expected size of the voluntary sector, ceteris paribus. Thus, for any given level of governmentally provided output, the larger the variance of demand, the greater the amount of voluntary-sector output that can be expected" (31). For example, in Western countries like the United Kingdom, France, Germany, Italy, and Sweden, there is a general positive association between a county's nonprofit sector size and the country's linguistic diversity (Salamon and Anheier 1998). Also, the United States, a country featuring a high degree of social heterogeneity and a vast array of nonprofit organizations, represents another living example to endorse nonprofit organizations' role as gap fillers (Kingma 2003).

## Nonprofit Organizations as Third-Party Partners

Instead of substituting government to serve citizens' unmet needs, nonprofit organizations may forge collaborative relationships with the government and become service delivery partners to provide publicly funded goods and services to citizens on behalf of the government. Indeed, recent decades have witnessed a sharp increase in government financing of nonprofit activities in policy implementation and service delivery. Driven by the institutional forces such as devolution and privatization, public agencies in many

Western societies prefer not to deliver public goods and services directly to citizens. Rather, they fund nonprofit organizations through financial tools like contracts and grants and rely on these community organizations to serve citizens. This kind of institutional arrangement is termed as the "third-party government" (Salamon 1987).

Under the "third-party government" arrangement, the scope and extent of government support of the nonprofit sector is extensive. Government funding can reach the nonprofit sector in a number of ways, including direct monetary support such as grants and contracts and indirect support such as tax-related benefits. For example, US Government Accountability Office (2009) estimated that in a given year among other federal supports, the nonprofit sector receives $135 billion in fee-for-service payments through Medicare, $25 billion in direct grants, $10 billion in direct contracts, and $50 billion in federal tax revenues forgone due to nonprofit-related tax expenditures. For most nonprofit organizations, as a result of their partnership with the government, government support constitutes a critical, if not the most important, funding source. According to the National Center for Charitable Statistics (NCCS), government direct support on average represents over one third of revenue for all public charities (McKeever 2015). Admittedly, there is a field variation in the amount of government funding obtained by nonprofit organizations. For example, in human service organizations, government funding represents a major revenue source, but in arts and culture organizations, the amount and the impact of government funding might be less significant. However, the overall importance of government support to the entire nonprofit sector is still irreplaceable in recent decades.

The rise of government-nonprofit partnership in policy implementation and service delivery can be analyzed from both government and nonprofit perspectives. On the government side, the rise of devolution and privatization in the policy environment, largely shaped by neoliberal ideologies, presents a new landscape for public service delivery. Devolution pushes many government programs from the national level to the local level, and privatization again pushes services delivery out to contractors. Public service contracting is generally featured by ambiguous performance and high provider discretion, which complicates government management and oversight. However, when government decides to contract out service provision, nonprofit organizations' defining features can give them an advantage over for-profit providers. Features such as the nondistribution constraint and public service orientation can bolster the perception by the public and government agencies that nonprofits are equipped to serve as trustworthy service contractors. In the United States, for example, nonprofit organizations are strictly prohibited from distributing revenue surpluses among organizational members and stakeholders, and thus this nondistribution constraint weakens nonprofit organizations' incentives to take advantage of the information asymmetries in service delivery. Further, nonprofit organizations' social mission alignment with government's public mission elevates the pursuit of social improvement over self-interest maximization. Furthermore, nonprofit organizations' roots in local communities also enable them to better understand local situations and respond to citizen needs. In sum, these features of the nonprofit sector are assumed to provide an assurance that public services, once contracted out to nonprofit providers, will be processed faithfully (Hansmann 1980).

On the nonprofit side, nonprofit organizations are voluntary organizations, largely relying on the voluntary actions of donors and volunteers. However, these voluntary actions are sometimes less organized and efficient, limiting nonprofit organizations' capacity to respond to social problems fully by themselves. Specifically, there are four major limitations that nonprofit organizations have to address: philanthropic insufficiency (lacking sufficient and reliable organizational resources), philanthropic particularism (focusing on particular groups of clients while ignoring others), philanthropic paternalism (serving donors' interests instead of wider social needs), and philanthropic amateurism (inefficiently managed and operated without professional workforce) (Salamon 1987). In these situations,

government might step in to help overcome the nonprofit weakness. As Salamon (1987) suggested, "government is in a position to generate a more reliable stream of resources, to set priorities on the basis of a democratic political process instead of the wishes of the wealthy, to offset part of the paternalism of the chartable system by making access to care a right instead of a privilege, and to improve the quality of care by instituting quality-control standards" (p. 42). As such, nonprofit organizations might partner with government and collectively deliver goods and services to address social problems. In sum, combining both government and nonprofit perspectives, there is the potential for a complementary relationship between government and nonprofit organizations.

## Nonprofit Organizations as Policy Advocators

In addition to working with public agencies as gap fillers or third-party partners, nonprofit organizations may also get connected to government through policy advocacy to influence public policy and government practice. Policy advocacy can be broadly understood as any attempt by nonprofit organizations to engage with government agencies to either directly or indirectly shape public policy (Pekkanen and Smith 2014). Specifically, nonprofit organizations may be involved in a variety of policy advocacy activities, such as offering testimonies before legislative committees, joining government task forces or advisory committees, providing legal services or funding for client litigation, and educating clients about proposed laws and regulations. Overall, by identifying social problems that are neglected by the public and bringing the voices of the underrepresented members of a society to the policy process, nonprofits help protect public interest and social justice. Indeed, the nonprofit sector has a long history of promoting democracy and civic actions. In this way, policy advocacy has long been considered as another defining feature of the nonprofit sector and a critical force in a democratic system (Jenkins 1987).

In recent decades, a variety of external forces such as growing competition for resources, increasing professionalization and commercialization, and greater emphasis on accountability and performance seem to discourage nonprofit organizations from fulfilling their critical advocacy role. However, given that policy advocacy is a relatively broad word and that existing empirical studies tend to measure it in different ways, we still do not have a complete understanding of the extent to which nonprofit organizations engage with government agencies for advocacy purposes. For example, a recent national survey of US public charities estimates that three out of four organizations engage in some type of policy activities such as direct lobbying and testifying before the legislative body (Bass et al. 2007). In contrast, in Indiana, only approximately 25% of nonprofit organizations are found to promote positions in policy issues (Child and Grønbjerg 2007). Again, another survey of over 3000 nonprofit public-benefit organizations other than hospitals and higher education institutions across the United States reports only 16% of the nonprofit organizations actually have advocacy expenditures (Salamon 2002). Despite the divergence in advocacy measurement and survey results, one thing is widely acknowledged by scholars and practitioners: through policy advocacy, nonprofit organizations participate in the public policy process and advance representation in democratic governance. In this way, nonprofit organizations act as social change agents to protect the well-being of their constituents and vulnerable populations at large and further promote social and economic justice.

In view of nonprofit organizations' participation in the policy process, the government would respond in two ways (Berry 2003). First, government could impose legal regulations on the extent to which nonprofit organizations can be involved in policy advocacy. In the United States, for example, public charities are legally strictly prohibited to engage in partisan activities such as endorsing or opposing candidates for office, but they can involve in nonpartisan election-related activities such as voter registration and education. Again, charitable organizations are permitted to perform

various nonelection-related policy activities such as public education and legislative lobbying, but their lobbying expenditures cannot constitute a substantial portion of their total expenditures. To some extent, the complex nature of the legal restrictions confuses nonprofit organizations and makes them hesitant about policy advocacy. Besides, the complexity in government regulations gives government more discretion in interpreting and enforcing the regulations and makes nonprofit organizations potentially more vulnerable to government actions.

Second, government may also become receptive to nonprofit organizations' certain policy activities. As mentioned above, nonprofits' roots in local communities and direct interactions with clients empower them to better understand community needs and the effect of government policies and programs, which gives them unique advantages to inform policy making and implementation. Again, increasing government funding of nonprofit activities would result in a close working relationship between government agencies and nonprofit organizations in the delivery of public funded goods and services. Under this working partnership, government agencies, especially at the local level, become heavily dependent on nonprofit operations in program design and development. In this way, governments may welcome nonprofit participation in the policy process to solicit feedback and recommendations on existing or proposed policy and practice. In sum, government presents both pressures and opportunities for nonprofit organizations to engage in policy activities (Lu 2016b). As a result, many nonprofit organizations, if they decide to participate in policy advocacy, become very careful with their advocacy efforts to ensure their policy activities would not directly confront policy makers and funding agencies, which would otherwise comprise their tax-exempt status and future funding prospect.

## Conclusion

In sum, the interaction between government and nonprofit organizations is a multidimensional construct. This entry describes that nonprofit organizations can interact with government, broadly speaking, in three ways: as gap fillers, as third-party partners, and as policy advocators. As gap fillers, nonprofit organizations provide services to meet citizens' diverse service needs that could not be addressed by government. As third-party partners, nonprofit organizations deliver publicly funded services and become partners of government. As policy advocators, nonprofit organizations engage with the government to shape public policy to promote social justice.

While considering government-nonprofit interactions, it is important to note that all the three strands of the interactions outlined above are not mutually exclusive, since each of the three fails to delineate the entire picture of government-nonprofit relations. These three types of interactions, collectively, define the dynamic and complex nature of government-nonprofit relations. In this way, it is more appropriate to take a holistic view of government-nonprofit relations, with each dimension of the relations in mind. It is also important to note that although this entry discusses each strand of government-nonprofit relations separately, nonprofit organizations in reality can interact with government in these three capacities simultaneously. Therefore, all the three strands of government-nonprofit interactions will not proceed in a parallel fashion, but intertwine with each other. For example, when government support becomes a critical funding source for nonprofit organizations as service delivery partners under the "third-party government" arrangement, government funding might undermine nonprofit autonomy and make nonprofit organizations less willing to participate in policy advocacy to challenge the government. In this way, it is more appropriate to take a dynamic view of government-nonprofit relations, considering the interactions among different strands of the relations.

## Synonyms

Associations; Interest groups; Nonprofit organizations; Public participation; Rulemaking

## Definition

Public organizations, such as advocacy groups, nonprofit organizations, for-profit firms, and professional associations, are the authors and the subjects of government regulations. As individual citizen participation in the regulatory process is comparatively low, public organizations can be seen as the chief authors of the public's concerns in the process of drafting and amending the regulations that fulfill the implementation of law.

## Introduction

Regulations, and the interpretive guidance documents that supplement regulations, are the material directions guiding organizations and individual citizens through the labyrinth of national, state, and local laws. These outlines for the implementation of law are not made by individual citizens or their representatives. Instead, the regulatory process is infused with the language, interests, and arguments authored by various public organizations (Jalilian et al. 2007; Wolfram 1977).

There are multiple reasons for the disproportionate influence of organizations on the regulatory process, whether the intraoffice drafting of proposed rules, the question-begging for guidance in regulatory interpretation, or the formal participation in informal (notice and comment) and

formal (adjudication) rulemaking activities. These are the same reasons why organizations, such as firms and political action committees, dominate the electoral finance landscape: funds and expertise. Regardless of the type of organization (see below), individuals organized into firms, associations, leagues, companies, and corporations are able to marshal intellectual, legal, creative, and financial means to author questions and directives that meaningfully influence regulators. Further, organizations themselves are able to use their credibility and clout to motivate citizens to take individual actions on their behalf, such as mass mail campaigns to regulators during the notice and comment period of rulemaking (Jorgenson and Wilcoxen 1990).

In general, regulation is best viewed as a continual process of incremental, written, but formal (rules) and informal (guidance) modification to the implementation architecture of law. This process begins with demands from downstream clients (e.g., firms) or legislators (speaking on behalf of the customers of those firms) to regulatory agencies for modification of firm behavior to comport with a belief about the public good. The requests from lawmakers or firms to regulatory agencies may spur rulemaking activities or studies of feasibility of rulemaking activities. Depending on the gravity of the requests and the threat of the firm behavior to the public interest, establishment of an independent regulatory commission may arise. In either a typical (agency rulemaking) or atypical (commission direction of further rulemaking) case, the authorship of regulations promotes further rulemaking activity as firms and regulators negotiate with one another about the interpretation of regulatory language, reporting requirements, and timelines. The circular process of request for regulation, authorship of rules, negotiation of rule implementation, and rewriting and renegotiation of those rules is definitive of the regulatory process.

## Types of Public Organizations

Both governmental and nongovernmental organizations influence the regulatory process. Governmental organizations that participate in the authorship of regulations span the gamut of possibility. An examination of the participants in informal rulemaking activities in the US federal government shows that governmental organizations participating in the regulatory process include: the offices of state and local departments, governor's offices, mayoral offices, city managers, Congresspersons, heads of other agencies and agency divisions, and governmental officials from outside of the United States (e.g., Ministry of Health). These participants often inveigh upon the rulemaking agency to consider the needs of their jurisdiction and constituents, whether individuals or industries, when formulating or revising rules.

The nongovernmental organizations participating in authorship or negotiations for changes in regulations also represent the range of possibility. Reflecting on the US regulatory process specifically, an examination of participants in notice and comment rulemaking shows that global, international, national, state, and local advocacy groups register their views about regulatory language. Statutory nonprofit organizations, churches, professional associations, manufacturer associations, groups of interested firms, universities, hospitals, and, of course, citizen committees and communities also weigh-in on the content of regulations (Smismans 2004).

Participation in the process of rulemaking is but one small part of the regulatory process, however. The participation of particular types of public organizations at different stages of the process is more revealing of the true influence of public organizations on regulation.

## Public Organization Influences in the Regulatory Process

The notion that regulatory agencies act independently in the drafting of rules and guidance is a myth. Instead, firms and interest groups, such as manufacturing associations, may seek to buffer against shocks from regulators by themselves drafting regulatory language and submit this to agencies for consideration. During the multiple iterations of interactions between the regulators

and regulated firms, it may emerge that a new area of concern needs attention. From the perspective of firms, it may be that prospectively *asking* for regulation limits their liability for particular behaviors. Likewise, some firms at the cutting edge of a technology may ask regulators to examine the language they have authored to guide the construction or implementation of that technology, with the effect that these "first movers" are able to get regulators to authorize their processes as the defensible standard for all others.

Lawmakers may also influence the regulatory process. Chief among the mechanisms of regulatory influence is the requirement to hold formal rulemaking hearings or to allow the rulemaking process to proceed via informal notice and comment periods. Likewise, lawmakers might draft highly specific laws that redirect agency rulemaking into narrowly confined spaces or may leave large chasms open for regulatory interpretation, thus effectively shirking responsibility for implementation of knotty laws. In instances where a lawmaker is not a direct participant in the authorship of the law that leads to drafting of a body of regulation, for example, where a state-level lawmaker commenting on national level regulations, law- makers may participate in the same way that other public organizations or individuals might.

Two types of public organizations that have an effect on the regulatory process in its design and implementation phase are advocacy groups (otherwise referred to as interest groups) and professional associations. While advocacy organizations may be subsets of other types – nonprofit or for-profit – and may have a wide range of potential resources bases, from well-resourced "name brands" (e.g., Amnesty International) to small time local operations (e.g., the friends of a particular park or lake), they interact with the regulatory design and implementation process with the purpose of ensuring that the interests of their organization and constituents are actively taken into account. To ensure this, they may marshal a mass mail campaign, draft extensive reports to regulators, engage in ex parte contact (except in instances of adjudication) with regulators, and gather other, similar, groups to their cause. Similar moves may be made by professional organizations; however, professional organizations may lean upon the shared background of education, professional discipline, professional language, and research techniques of the regulatory agency to get their specific message across. In some cases where implementation of a regulation threatens the constituents or members of a profession, they may pursue legal action against the regulators to meet their needs.

That ministries from other nations weigh-in upon the regulatory activities of another nations' regulatory agencies strikes some observers as unusual. Regulatory diplomacy or the attempt of one nation to get another to consider the effect of its regulation on other nations' government agents, firms, and citizens is a more visible part of the regulatory process where notice and comment rulemaking is used. As there are no a priori restrictions on whose interests could be taken into consideration in the regulatory process, the new visibility of regulatory diplomacy could be considered a boon for transparency in the architecture of global governance.

## Regulatory Recipients

It is commonplace (in the English language at least) to refer to organizations as "subject to regulations." The choice of language is indicative of a perspective on the relationship of non-governmental organizations (for-profit and non-profit) to governments. To be subject to regulations suggests that the government has power, through the implementation of regulations, to coerce organizations to perform actions that they otherwise would not. Examples of this abound: restaurants subject to the regulations imposed by health inspections may prefer that there is a wider window of variation in allowable temperatures for walk-in freezers; electric power plants may prefer that they are not required to produce reports about particular pollutants that

their scrubbers have otherwise removed from exhaust; hospitals may prefer not to have to report readmission rates. In each of these cases, what regulations require of public organizations is that they respond to the attempts of lawmakers to define or clarify a public good.

Debates rage whether regulations help or hinder businesses or the economy at large. On one side, consumer advocates suggest that regulations protect customers from potentially harmful practices of for-profit firms. In this view, regulations put brakes on an otherwise unfettered capitalist program of acquisition. An oft-rehearsed example of this is the establishment of a national food and drugs safety program in the United States following the publicity of meat-packing conditions in Upton Sinclairs' *The Jungle*. On another side, business organizations, education institutions, and small firms decry the cost of compliance with regulatory mandates. In this view, regulations pose undue burdens of analysis and reporting that add to costs that viable, nonfraudulent, businesses would otherwise bear in the conduct of good business practice (Jalilian et al. 2007; Jorgenson and Wilcoxen 1990). Examples of this are more esoteric and restricted to the relevant business type, but can include requirements of ambulatory surgical centers to report to the US federal government the uptake of influenza vaccines by employees on a quarterly basis when most healthcare organizations strongly recommend their employees voluntarily take the annual vaccine. Another side of the regulatory debate is whether regulations compel, through the unforced force of markets, a leveling-up or leveling-down trend in business practice or even between regulatory regimes of particular countries. Arguments for a leveling-up effect – the "California Effect" or the "Brussels Effect" – suggests that firms seeking wide markets or nations seeking maximum market access for national goods will "level up" their regulations to comply with the maximum restrictive set. Arguments for a leveling-down effect, a "race to the bottom," suggests that shrewd firms will pursue relocation in the least restrictive regulatory zone in order to reduce operational costs of regulatory compliance (Smismans 2004).

Regardless of the proregulatory or anti-regulatory stance of organizations, it is certain that competent players in local, national, and global marketplaces are those that pay careful attention to regulations. Public organizations that are most politically shrewd will seek compliance as well as windows of opportunity to participate in the process of designing and redesigning those regulations.

## Conclusion

Public organizations of varying types and sizes all play a part in the process of designing, implementing, and changing the regulations that coordinate the public good. Governing organizations make and are subject to regulations that are also made and followed by nongovernmental, for-profit, and nonprofit firms. The routine dance of regulatory interaction drives change, growth and decay, in public organizations.

## Synonyms

Citizen participation; Public engagement; Public involvement

## Definition

Public participation is about the involvement of those who may be affected by or interested in a decision through formal or informal channels. The purpose of public participation is to enable participants to take action and to be heard in decision-making processes and, as a result, to affect the final outcome. The foundation of public participation is the distribution of power, and therefore, it is viewed as an expression of democratic spirit. A policy that involves as many affected citizens as possible in its decision-making process is considered more legitimate than those arbitrarily decided by policymakers alone.

## Introduction

The concept of participation has appeared in different fields, such as social participation and community participation in the social sphere or political participation in the political sphere. This concept has been extended to a sense of public participation, citizen involvement, or citizen engagement. In the social sector, participation means that those who have been excluded from the government's decision-making process organize efforts to increase control over resources and institutions (Stiefel and Wolfe 1994). Community participation, therefore, refers to the involvement of community residents in the formulation and implementation of local programs that are designed to solve problems that the community is facing. All community residents are encouraged to take part in each step of the problem-solving process, including problem identification, solution development and selection, program implementation, and outcome evaluation. In the political sector, participation involves interactions between government agencies and individuals or organized groups in the policymaking processes, whereby citizens participate in legal activities aimed at influencing government decisions (Verba and Nie 1987: 2). It is noteworthy that the intended outcome of political participation is to allow the public to influence government decisions, particularly in a flow of influence upward from the masses, rather than to show support to the government decisions, which clearly differentiates political participation from political mobilization (Verba and Nie 1987: 3). The participatory method in the political sphere is associated with activities that take place in representative democracies, such as voting and campaigning, or organized group activities, such as protest, rather than direct participation in the governmental decision-making process.

Public participation, citizen involvement, citizen engagement, or citizen participation broadens the boundaries of social and political participation. Public participation recognizes participation as a human right, as well as a social and civic responsibility. Recognizing participation as a right means that citizens have the right of participation in making policy that directly or indirectly affects their lives. At the same time, a citizen is responsible for playing an active role in making decisions about their future. Citizen participation goes beyond traditional forms of indirect representation and emphasizes direct ways in which citizens exercise control in governance. Even if the political institution is one of indirect representation, citizen participation emphasizes that the citizens becomes more active and take the initiative to intervene in policy formulation and decision-making in the areas that affect their lives.

The appropriate role of the public in the policymaking process has led to much discussion, accompanied by advocacy in favor of citizen

engagement, and the suspicion that barriers to citizen engagement hinder meaningful participation. Given that meaningful participation consumes many resources such as time and manpower, the level of public participation should be determined on a case-by-case basis, taking the political circumstances and the nature of the concerned issues into consideration. Public participation is essential in pursuing justice, especially in the field of environmental governance. In making environmental policy that affects underserved communities, attention has been focused on improving public participation to ensure that communities have a voice in environmental decisions. However, meaningful public participation has never been easy. For it to be feasible, challenges to public participation have to be overcome, and steps to meaningful participation have to be taken to ensure that the process is authentic, rather than a mere public relations scheme.

## Perspectives on Public Participation

Arnstein (1969) argued that citizen participation means citizen power. By identifying eight levels of participation, Arnstein (1969) showed that participation can range from the empty ritual of participation to participation with real control over the outcome of policy processes. Citizen power exerts substantial influence on the outcome of decision-making processes only at levels 6, 7, and 8 of participation: partnership, delegated power, and citizen control, respectively. Partnership means that citizens and power holders agree to establish a collaborative mechanism to share decision-making responsibilities. Delegated power means that the citizen has dominant decision-making power, for example, by having the majority of seats in a committee delegated to make decisions on a particular plan or program. Citizen control means that the citizens have the guaranteed power to oversee a program or an institution. Other than these three levels of participation, levels 1 and 2, manipulation and therapy, respectively, are categorized as nonparticipation. Levels 3, 4, and 5 (informing, consultation, and placation, respectively) ensure that citizens do not have their voices heard and that power holders have the ultimate right to decide.

Public participation has many functions. The main function is to provide an opportunity for communication between the power holders (usually government agencies) and the public. By encouraging the public to have meaningful input into the decision-making process, the communication becomes a valuable channel for government agencies to learn about the public's concerns, resulting in policy that incorporates a range of interests (Wouters et al. 2011: 17). In line with the communicative function, public participation can enhance sustainable development that can be achieved only through the involvement of all stakeholders whose awareness could be raised through participation (Bass et al. 1995). Well-managed public involvement increases the legitimacy of decisions in the eyes of the affected, and the decisions are therefore more likely to be implemented effectively (Dietz and Stern 2008). Through meaningful public participation, a lasting and trusting relationship between stakeholders, especially the one between the government and citizens, can be built and will benefit sustainable collaborations (Dietz and Stern 2008). In the sphere of environmental policy, many decisions should be calibrated to local environmental circumstances that can be effectively learned from local residents' daily observation and life experience. Public participation helps decision-makers obtain a baseline of information from the citizens. Nowadays, the citizen science movement encourages public participation in environmental science research to expand the scale of the collected data and, through well-managed data collection processes, to increase the accuracy of the data (Dickinson and Bonny 2012: 1–15). This movement recognizes the value of citizen knowledge that is essential for policymaking. In addition, citizens learn the skills and knowledge related to contribution to public affairs through participation. When citizens become accustomed to and experienced in public participation, the quality of the policies made by the public improves.

While public participation is highly desirable due to the numerous advantages associated with

participating in decision-making processes, there are also inevitable disadvantages. Irvin and Stansbury (2004: 58–60) examined whether it is worth the effort to involve citizens in the decision-making process and listed the disadvantages of public participation to participants and the government. The disadvantages are as follows:

1. Costs: A decision-making process emphasizing public involvement is very time-consuming for both participants and government agencies. An expert on the relevant issues can make quick decisions that could otherwise take the public months to reach.
2. The difficulties of diffusing citizen goodwill: In the case of a large community with diversified perspectives on an issue being discussed, citizens who finally take participatory action do not necessarily have influence in the community. Unless participants are elected and are known to represent a constituency, decision made by participants may not be legitimate in the eyes of nonparticipants.
3. Complacency: In the instance in which the community is complacent or the public is likely to accept a decision made by a delegated agent, public participation is not necessary for two main reasons. One is for the sake of efficiency, and the other is due to the gap between intending to participate and taking real action.
4. Representation: Participants who have resources, such as time, to attend meetings may only represent specific social groups or socioeconomic levels. In many instances, participants may have a background in local politics and their preference may only reflect partisan interests.
5. Lack of authority: In the scenario in which the output of public participation is ignored, merely taken under advisement, or only for the purpose of endorsing or justifying a predetermined decision, public resentment will develop.
6. The power of wrong decisions: The decision made through a public participatory process may be inappropriate due to a lack of expertise, local politics, or an inaccurate representation of interests. In the era of emphasizing democratic spirit, it is found difficult to defy a decision made by the public even where it appears to be an incorrect decision.
7. Persistent selfishness: The presumption that a decision made through a public participatory process is altruistic should be reconsidered, as an individual may participate in the decision-making process solely for personal gain.

## Public Participation and Procedural Justice

Public participation is an important approach in pursuing procedural justice. Although the definition of justice can vary, procedural justice has a less controversial definition and refers to the fairness of the decision-making process. Advocacy of procedural justice builds a foundation on the presumption that the final decision made through a process that fairly and meaningfully involves affected stakeholders is just and legitimate (Tyler 1988). If the public perceives the decision-making process as fair and just, it tends to accept the final decision as legitimate. What characteristics lead to a decision-making procedure being recognized as just? Tyler (1988) found that the general public ranks consistency or similarity of treatment and outcome across time and between participants, as the most significant characteristics. In addition, the accuracy of results, bias suppression, and representation within the process are the second most significant characteristics of procedural justice for the public. These characteristics reveal that participants' subjective perception determines how they assess the fairness of a decision-making process. When participants perceive that they are treated equally, regardless of race, color, religion, national origin, or income, and that similar fact patterns will generate similar results, they start to believe that procedural justice can be achieved. In addition, bias suppression remains a challenge. People who have developed a bias against a specific perspective may not be aware that a bias exists. Therefore, when the bias of a group of people is suppressed during a decision-making process, it is unlikely that they would still consider the process just.

The conception that helps associate procedural justice with public participation is recognition. Recognition refers to an action or process of accepting someone or something that is important. It is to acknowledge the existence, validity, or legality of someone or something. When examining distributive injustice, Young (1990) found that the lack of recognition of social diversity is the main reason behind ubiquitous unjust distribution. The lack of recognition that is presented in different forms and exists in society, embedded in the social structure, culture value systems, and even political networks, results in individual or specific groups being excluded from the process of making decisions that will affect their lives. In the process of social interaction, recognition is a dynamic and ongoing process. Mutual recognition can be affected by culture and institutions. At the same time, it reciprocally shapes, reinforces, and maintains the extant culture and institutions. The social relationships between people is defined by social norms, rules, language, and symbols, in which we can see the difference between individuals, or between social groups, as disrespected or even ignored (Fraser 1997). Given that the lack of recognition is deeply embedded in society, "recognition as justice" becomes another approach to examining justice. In pursuing procedural justice, mutual recognition is transformed into a form of welcoming the public into the decision-making process. Participants cultivate a sense of ownership in the final decision when they feel that they are being heard, that their concerns are being responded to, and that their interests were reflected in the final decision. Participants also cultivate a sense of being bound by the political system during the participation process and therefore recognize the political system as a legitimate source of obligations (Tully 2000).

In the case of underserved communities, recognition from the government is particularly important. Underserved communities have long been ignored by society or the government. They may have internalized society's negative perception of themselves and hold a pessimistic attitude on participating in public affairs. They may have lost their identity of being a part of society and feel incapable of representing themselves in a public debate and making judgments about issues under discussion (Honneth 1992). Under such circumstances, recognition from the government provides an opportunity for affirming dignity and reviving self-confidence (Schlosberg 2007). Recognition from the government should start from recognizing stakeholders as rightful participants (Young 2000) and presenting a regularized public participation mechanism. In other words, to make the public feel that their right to participate in decisions that affect them is being recognized, the importance of public participation should be regulated and enforced by law.

Does procedural justice guarantee the best outcome for participants? From the discussion above, we know that a just decision is one that balances multiple interests or compromises among conflicting interests, so that different voices representing various interests are heard. The outcome resulting from a just decision is not guaranteed to fit the best interests of each stakeholder, and it could even be far from the ideal outcome from a professional viewpoint. However, a decision made through meaningful participation of the affected stakeholders is recognized as valuable in embracing diverse views and concerns. Stakeholders should have the right to determine what they want and should be recognized even if their decision is viewed with disapproval. Therefore, to achieve procedural justice and, at the same time, ensure that the decision being made by the affected public does not violate the public interest, the public should be empowered by providing them with transparent and comprehensive information and training programs.

In promoting procedural justice, the role of the government is that of the facilitator rather than the arbitrary decision-maker. Although the government still has the ultimate authority for policymaking and implementation, citizens should be placed at the center of policy consideration rather than as merely a policy target. To develop policies and design services that respond to citizens' needs and match their circumstances, meaningful citizen participation is the only tool to obtain useful information. One of the most important foundations for democracy is the belief in individual freedom, self-identity, and

self-determination. Therefore, the government does not need to decide what the best or most appropriate policy is for the public. Rather, the government should create a fair dialogue forum for affected stakeholders and ensure that they are well-informed of participatory opportunities and are provided with essential information for making informed decisions. Only when affected stakeholders' right of participation is recognized, and they are well-equipped for meaningful participation, can procedural justice be accomplished.

## Meaningful Public Participation

Public participation can be an empty ritual without making a difference in final decisions. A meaningless public participation process is a waste of time for both government agencies and the public. However, achieving meaningful public participation is challenging because of various barriers to participation. The goal of meaningful public participation cannot be reached without identifying and overcoming these obstacles to participation.

### Reasons for Nonparticipation

There are many reasons that prevent citizens from being able to participate effectively in public decision-making. The main concern is that the public does not have any real, practical power to influence decisions. Typically, the public is composed of diversified interests and perspectives. To make participation meaningful for different groups, the decision-making process needs to involve individuals representing multiple views (Beierle 1999; Beierle and Konisky 2000; Julian et al. 1997). To make different interests and perspectives heard, participants should reflect the demographics of the public, and, if participants are elected by the public, they should be trusted by and speak on behalf of the group represented. This is called the institution of representative democracy. However, practically speaking, the public cannot know with certainty whether elected representatives are working to stand for the interests of ordinary citizens, because information is not available in a completely transparent manner. This leaves room for representatives to work based on their private interests rather than the public interest. Therefore, ordinary citizens do not have real control over elected representatives and do not hold real power to affect decisions. Even if citizens have some degree of control over representatives, it might not make a difference in practice. In fact, when conflicting interests compete with each other, the interest with more political power wins the race, regardless of opponent citizens' opinions or the appropriateness of the final decision. Accordingly, the entire decision-making process is unlikely to be under citizens' control.

The public does not have real power to making policy decisions partially because of the lack of accessibility of relevant information and the lack of expertise that can help the public make the right judgment (Kweit and Kweit 1981). In the era of the Internet, information becomes more accessible if the government is willing to make it transparent. However, even if the information is available to the public, not everybody enjoys the same accessibility because of the lack of hardware. Low-income families may not be able to afford to have a computer and Internet access. Computers may be provided in public libraries or community centers, but a lack of education and knowledge may hinder the use of computers and search engines. In addition, it takes time and knowledge of what to look for when sifting through highly technical information. Even if information is completely transparent, ordinary citizens will be overwhelmed by the huge amount of data if they lack expertise.

Due to the aforementioned barriers, stakeholders may make judgments based on rumors, hearsay, or expert opinions. A judgment based on rumors and hearsay may lead to a decision that does not fit stakeholders' best interest. However, a judgment based on expert opinion may lead to a decision that has been mobilized by certain interest groups or skewed by specific political interests. For example, in the case of brownfield revitalization, contamination cleanup is a highly technical task that ordinary residents living near pollution sites may not be capable of understanding. Without relevant knowledge about various cleanup approaches and their costs and benefits,

residents will be unable to make the right choice. In a highly technical field, experts' opinions, compared to ordinary citizens' opinions, carry more weight. However, experts are not necessarily neutral on political matters. At the same time, jargon and complicated technical issues often discourage ordinary citizens from participating. In this case, residents' participation becomes merely symbolic. In addition, citizens without relevant knowledge are not capable of distinguishing short-term benefit from long-term benefit. As a result, the final decision may not benefit citizens for the long term and appears to be made based on the citizens' choice. For example, a cash indemnity seems more attractive to pollution victims than a brownfield community revitalization plan. Without knowing the real long-term benefit that may result from the revitalization plan, citizens may prefer a cash indemnity that can increase short-term income.

Meaningful participation should be based on participatory incentives, which could easily fade away when citizens realize that their voices do not make a difference in the final decision. Consequently, citizens become less inclined to attend discussion forums or meetings that are open to the public. Public meetings held by government officials therefore serve as a public relations scheme and an instrument to legitimize the final decision. This scenario is most often present in underserved communities because this type of community has a long history of being ignored by authority. Residents in such communities are unlikely to trust the government and believe that their voices will be heard and will make a difference in the policymaking process. Participatory incentives may be affected by some other factors that are sometimes used by the government for minimizing the voices of citizens. For example, the public meetings are scheduled at a time that conflicts with citizens' work time, or the meeting place is located where citizens do not have easy access. In these cases, no matter how many public meetings are held, they are not useful for those involved, and the conclusions and decisions made at the meetings can be opposite to the interests of citizens affected by the decision (King et al. 1998).

Failure to recognize participation as a right hinders meaningful participation. The right to public participation means that the citizens affected by a decision have the right to access accurate and comprehensive information regarding this decision and the right to be involved in the decision-making process. The recognition of the right to participation of those involved has two functions. The first function is for the government to create a formal mechanism to honor this principle, such as putting this right into law so that the public is guaranteed the right to participation. The second function is for citizens to recognize participation as a fundamental right to which a person is inherently entitled simply because she or he is a human being (Cornwall 2008). Once the sense of right to participation is established, citizens would be more alert about the possibility of a rights violation. In addition, when participation is considered as a human right, citizens feel that they are also obligated to prevent other people's rights from being violated.

## Prerequisites for Meaningful Public Participation

Public participation can serve as an instrument to manipulate the public or as a meaningful method to promote democracy (Arnstein 1969; Barber 1984; Drysek 1990). Manipulating the public can allow quick decision-making without seeking after the opinions of the public; however, such a decision is likely to encounter at least two difficulties. One is that the government spends resources on something that does not reflect the true needs of citizens, and the other is that the implementation of the chosen programs is unsuccessful because of the lack of public consensus. In contrast, promoting and conducting meaningful participation is often a very time-consuming and lengthy process, but a decision reached by such a process can involve a range of perspectives from the public, resulting in a policy outcome that approaches public expectation. Although meaningful public participation can help generate a policy that integrates the diverse expectations of the public, the time-consuming process often discourages the government from investing resources in it (Fainstein and Fainstein 1993).

To differentiate public participation from empty rituals of participation, the focus should be shifted away from efficiency of the decision-making process to the promotion of meaningful public participation. The foundation of meaningful participation is that "there must be citizens who are willing to participate" (Solitare 2005: 921).

Five prerequisites for meaningful participation described by Solitare (2005) are presented here as follows. First, stakeholders must commit to citizen participation. In most cases, this means that the government is willing to share decision-making authority with the public and commit to empowering the public by, for instance, sponsoring education programs or technical assistance about the issues concerned. The main point is that the public should sense or feel the government's sincerity of listening to citizens, and the citizens should know that their voices will be heard, considered, and incorporated in the final decision.

Second, citizens must be aware of the opportunities to participate. This prerequisite is twofold. In a community-based direct democracy, every citizen should be informed of the actual opportunities to get involved. This means that they know where to attend the discussion forum, if there is any, or how to express their opinions through the relevant channels. In the situation of representative democracy, although the party responsible for participating in meetings is representative, citizens should be aware of the most up-to-date information and of the ways to ensure their interests are truly represented.

Third, citizens must have time to commit to the process. As noted above, meaningful participation is a lengthy process. This process is not only time-consuming in terms of attending a series of meetings but also time-demanding in terms of, but not limited to, acquiring relevant information, analyzing data, getting educated about relevant expertise, and discussing the issues concerned with other interested citizens. Available time could be a luxury for people who have to spend most of their time fighting for subsistence. Therefore, attention should be paid to meaningful participation of the most disadvantaged, whose voices are rarely heard and whose time and capacity for participation are extremely limited.

Fourth, citizens must trust that other stakeholders are fair and honest. Public participation is particularly important when trying to incorporate conflicting interests, in which the lack of trust is the main obstacle for participants to open up to different perspectives. In a case such as brownfield revitalization, trust is unlikely to be easily established because it typically involves three types of actors whose interests are difficult to reconcile: those of pollution victims, polluters, and different levels of government agencies. Residents who live in a community that has long been negatively affected by pollution often distrust government agencies as well as other outsiders (Slovic 1993; Beierle and Konisky 2000). In the worst scenario, pollution victims could suspect that the government is inclined to polluters' interests and not being fair to the victims. They may not trust the information released from the government and polluters. The suspicion that stakeholders are being dishonest may discourage citizens to dedicate resources (e.g., time, money, network, energy) into participation because they believe that doing so would be futile.

Fifth, the issue under consideration must be one that citizens perceive to be problematic. To get citizens to participate in time-demanding decision processes, they must view the issue being discussed as a problem that matters to them (Irvin and Stansbury 2004; Yoder 1999; Lowndes et al. 2001). Typically, participatory incentive increases when potential participants perceive that the decision to be made could affect their immediate interests, such as posing a threat to the quality of life or resulting in damage to their health or wealth. The threat can be further classified into two categories: visible and invisible threats. People tend to respond to visible threats, while invisible threats are more easily ignored (Greenberg and Schneider 1996; Slovic 1987).

In addition to the aforementioned five prerequisites, other factors affecting participatory incentives also deserve attention. Accessibility to information is linked to participatory incentives. Before a participatory motivation can be generated, a citizen should have adequate access to full

documentation regarding the issues being discussed. This means that the documentation can be easily accessed and its presentation should be easy for ordinary people to understand. The government should not intend to provide needless information to overwhelm the public. Additionally, in many hearings in the past, participants have been outraged about not being heard and have complained that the hearing is for the government to inform the public about their final decision rather than to gather information from the public. Participating in a meaningful way requires potential participants to be confident about their voice being heard and their participation making a difference in the final decision. For the public to have such confidence, public participation is better conducted in the earlier stages of the policymaking process, such as at the stages of problem identification and policy formulation. Problem identification involves the identification of stakeholders, their standpoints, and how they perceive the problem. In this stage, the most dominant voice should not be permitted to become the most influential in the final decision. Those stakeholders without strong voices should not be ignored. The early stage of policy formulation involves a series of actions to transform stakeholders' needs, visions for the future, and expectations into specific projects and programs. Involving the public as early as possible in the decision-making process can raise their confidence about their opinions being respected, in which a strong motivation of participation can be cultivated.

## Practice of Meaningful Public Participation

Meaningful public participation is easier said than done. The process takes time and can sometimes be very expensive, considering all the resources that the process consumes. Weeks (2000: 371) noted that, based upon an assessment of practical feasibility through the implementation of four large-scale public participation models, the application of public participation "is limited to instances where the issue is critical, the political process is deadlocked, and there remains sufficient time to complete a yearlong process." This emphasizes the importance of situation assessment before any public participation program is applied.

In the Public Participation Guide (The Public Participation Guide is provided by the US EPA for public participation and public outreach in environmental decision-making. Retrieved from https://www.epa.gov/international-cooperation/public-participation-guide-introduction-guide) developed by the US Environmental Protection Agency (US EPA), situation assessment is designed to determine the public participation program and techniques that are most feasible and appropriate under the circumstances. Situation assessment includes two phases: the first one is the internal assessment process of identifying problems being faced and the agency's available resources and expectations, while the second one is the external assessment of identifying stakeholders and exploring their standpoints. Based on the results of the situation assessment, an appropriate level of public participation can be recommended.

The level of public participation is based on the Spectrum of Public Participation developed by International Association for Public Participation (IAP2) (The Spectrum of Public Participation describes five levels of public participation by identifying public participation goals, promises to the public, and example techniques. Retrieved from http://c.ymcdn.com/sites/www.iap2.org/resource/resmgr/Foundations_Course/IAP2_P2_Spectrum.pdf. The five levels of public participation are (1) inform, meaning no opportunity for public participation is provided; (2) consult, meaning minimal opportunity for public participation is provided by asking the public for their opinions; (3) involve, meaning a level of participation, in which the public is invited to the decision process while the agency is still the decision-maker, is provided; (4) collaborate, meaning seeking of public involvement in decision-making and a consensus is attempted while the agency is still the ultimate decision-maker; and (5) empower, meaning a full opportunity for public participation is provided and the government agency commits to implementing what the public decides.

After the appropriate level of public participation is selected, a decision-making process should be designed to integrate the selected participatory level. Designing a decision-making process involves determining the key steps and timing in the process, the way the public input is being obtained and used, the tool used to keep the public informed, the way the decision criteria are being established, and the alternative being developed, as well as who the final decision-maker is. It is essential that all stakeholders fully understand the process and have the same expectation regarding the outcome of the process before the process is applied.

## Public Participation in Taiwan

Public participation in Taiwan has prospered greatly since the lifting of martial law in 1987. Kuomintang (KMT), the ruling political party in Taiwan since 1949 when its military lost in Chinese Civil War and evacuated to Taiwan, imposed martial law at the year of evacuation and dominated Taiwan's political system for more than 38 years. Under martial law, a significant amount of tight restrictions on freedom of assembly and association, speech and the press, and political rights were imposed. Those who really or suspiciously opposed to KMT were executed or imprisoned during the White Terror, which broadly refers to the period from 1949 to 1987.

The lifting of martial law allowed opposition political parties to be formed legally. Given more freedom of speech and press, the public can express their anger against the dictatorship of KMT legally through social movement participation. Starting from late 1980s, expansion of public participation could be witnessed in many antipollution protests, which intended to fight for a better quality of life and against KMT's GDP-oriented policies. A good example of KMT's policies emphasizing economic growth is the Ten Major Construction Projects, which formulated and implemented when KMT sought to build its legitimacy upon economic growth after giving up the policy of retaking mainland China. These projects, including the construction of nuclear power plants and the development of the petrochemical industry, accompanied with the lack of decent environmental laws, have resulted in the deterioration of living environment for Taiwanese people. After the termination of martial law, annual count of environmental protest events increased drastically and reached historical high in 1991 with 215 cases, compared to a count of 17.9 in average when the law was still activated (Ho 2011: 288–289).

Along with the political democratization of Taiwan, the passion for public participation has been developed to address various kinds of economic, social, and political problems. For example, the Wild Lily student movement in 1990 was a student demonstration for democracy. In the past decade, the most famous and sizable protest is Red Shirt anticorruption movement in 2006, originally called "one-million people down Bian movement." Bian, standing for Chen Shui-bian, was then the president of Taiwan since Democratic Progressive Party, the major opposition political party to KMT, won the presidential campaign in 2000 and terminated KMT's ruling for five decades. The Red Shirt anticorruption movement emerged because of a series of accusations of corruption against President Chen and members of the first family.

Advancing community development through public participation has been promoted and financially supported by Taiwan's central government. The idea of community development was formally promoted in the enactment of Community Development Work Outline (CDWO) by the Ministry of Interior in 1968. This work outline was not meaningfully put in practice until it was revised in 1991. The CDWO encourages community members to establish community development association, through which the community residents cooperate to solve local problems. The concept of community empowerment was advocated by the Council for Cultural Affairs in 1994, which is considered as "a real working basis for constructing local identity and civil society in Taiwan" (Peng et al. 2010: 138).

In recent years, some local governments in Taiwan have started to practice participatory budgeting. Combining the spirit of participatory

democracy and the operating mechanism of deliberative democracy, participatory budgeting was implemented for the purpose of solving community problems through the cooperation between the local government and the civil society. Taichung city government started to practice participatory budgeting in 2015. The budgeting process is as follows (The process of participatory budgeting of Taichung City. Retrieved from https://pb.taichung.gov.tw/process):

1. Workshops and seminars should be held by the end of August each year to empower citizens for active engagement in participatory budgeting process.
2. Citizens should propose ideas through residential meetings and relevant experts, including scholars and public officials, and provide comments on the proposed ideas by the end of September.
3. After all proposals are posted on the participatory budgeting official website, a two-stage voting activity should be held through i-voting, an online voting mechanism. By the end of November, six proposals that receive the highest votes get the budget approval for project implementation.

The participatory budgeting in Taichung City is still in its infancy stage. The number of votes received, compared to the population of the city, is disproportionately low. The project proposed by the citizen tended to be small sized. For example, the budgets of the six selected proposals in 2015 ranged from NTD $100,000 to $1,200,000 (about USD $3000 to $37,500) (The selection results of 2015 participatory budgeting proposals in Taichung City. Retrieved from http://2015taichungivoting.weebly.com/31080369843208026524.html).

## Conclusion

Although public participation lies at the heart of democracy and procedural justice, let us not ignore the fact that meaningful citizen engagement is resource consuming and difficult to achieve. Authentic public participation provides a communicative opportunity between stakeholders and helps them make a decision that incorporates different interests and therefore becomes more legitimate in the eyes of the affected. Participants are empowered through engaging in the decision-making process and are likely to establish trust through meaningful interaction, which contributes to sustainable collaboration. Meaningful public participation, however, can be challenging and costly. A decision-making process emphasizing citizen involvement is time-consuming and always involves challenges of representation and a lack of participatory incentives. In addition, the public may make a poor decision because of the lack of access to information, the lack of expertise, and persistent selfishness. Due to these challenges, the necessity and level of public participation should be evaluated and determined before it is conducted in the decision-making process. Meaningful public participation is particularly important for underserved communities in allowing them to shape policies that affect them. The price of meaningful public participation in underserved communities may be high, but it is worth the cost when the purpose is to pursue justice and the sustainable development of the community.

# Public Participation in Procurement

Amy Beck Harris
Daniel J Evans School of Public Policy and Governance, University of Washington, Seattle, WA, USA

## Synonyms

Citizen engagement and contracting; Contracting-out public participation

## Introduction

Public participation, or the engagement of citizens in policy decision-making, is an increasingly important and studied phenomenon in public

policy literature. This citizen engagement may occur to various extents, at different levels of governance, and at several points in the policy process. While this volume covers many of the research pathways within public participation in other entries, this section focuses on how contracting-out public participation to third-party actors influences the occurrence and nature of public participation.

The majority of public participation studies focus on participation designed and implemented directly by elected government actors or those working within public administration. However, studies of new public management describe a governance system in which third-party actors and indirect implementation of policy have become commonplace. For example, in 2018, the United States Government hired contractors to implement activities and procure goods and services worth over $587 billion or just over 14% of total federal government spending (Federal Procurement Data System n.d.; USA Spending n.d.). Further, those familiar with policy implementation can think of numerous examples of participatory activities being implemented by third-party actors. These trends have given rise to a new area of focus: public participation through government contracting. To date, there are only a few studies on the topic available, with quite a range of research remaining to be done. This section outlines how contracting changes participation and when participation may be implemented in the contracting process.

## How Contracting Changes Participation

Contractors are often hired to implement public participation activities as one of a variety of tasks or goals in the implementation of a broader project. They sometimes seek citizen feedback on project quality or citizen input on the potential impacts of public projects they've been hired to implement. Alternatively, contractors are hired to implement one stand-alone participation activity, such as a charrette to generate and evaluate policy options, or surveys and interviews with target citizens to evaluate a policy's performance. Existing literature on the intersection of participation and contracting highlights the first case, where we see variation in the extent to which participation is actually included in the contract. Current studies demonstrate the presence of participation in contractor activities when sufficiently incentivized, the importance of explicit contract specifications for implementation of participation, and a decrease in the scope of influence for citizens when participation is contracted out.

Contracting does not seem to decrease the occurrence of participation so long as it is effectively incentivized in the contract (LeRoux 2009; Mosely 2012; Amirkhanyan and Lambright 2018). In order to incentivize participation, a contract can tie payment for contract services to completion of participation activities, include participation as an expectation in the contract – but not explicitly require it for payment to be rendered, or encourage it outside of the contract document itself. If a contract is to include participation, it is typically found within the required tasks for payment, deliverables, expectations, and priorities or within the background or summary sections to explain the context and broad "flavor" of the contract's work. LeRoux (2009), Mosely (2012), and Amirkhanyan and Lambright (2018) find that government contracts with explicit contract specifications for participatory activities do provide sufficient incentive for ensuring contractors implement participation activities. Alternatively, in cases where participation is a priority but not a contractual requirement, contract implementers are found to take different actions, in particular when they face multiple competing demands. In these cases, they will prioritize their contractual obligations, sacrificing any non-required priorities – including public participation (Amirkhanyan and Lambright 2018; Nishishiba et al. 2012; Nowland-Foreman 1998). This finding is reflected broadly in contracting research: when a particular task is included as either a formal requirement for successful completion or attached to payment, it is more likely to be prioritized and accomplished (Brown et al. 2003; Salamon 1993). Ensuring successful monitoring of requirements associated with payment is

a further incentive to ensure that contractors fulfill their requirements (Brown et al. 2006).

There are a variety of ways that contracting-out participatory activities or activities with a participation component influence the nature of the participation – in particular, the degree of separation between participating citizens and their government, the degree of influence citizens have over policy decisions, and the incentives the implementer has for participation activities. Obviously if a contractor is carrying out participatory activities, then the actors involved change from government actors to third-party actors, creating an extra layer of separation between citizens and their elected decision-makers. This may result in decision-makers being disconnected from the public in future policy decision-making. Further, this disconnect will make citizens feel less heard by their governments, resulting in less public buy-in and potentially public opposition.

Amirkhanyan and Lambright (2018) find that government contracting decreases the substantive contributions that citizens are able to make during policy planning and design. They offer the most in-depth study to date, conducting almost 100 interviews of government contract managers and for- and nonprofit government contractors in the health and human services sector about their experiences with citizen participation via contracts. They find that while participatory practices are commonly implemented by contractors, the participation tools used are more limited than those used by government. Most stuck to a few select participation tools with established protocols such as client surveys, advisory boards, or public hearings. Using these tools, contractors gather citizen perspectives and experiences to inform their own decision-making process in a one-way flow of information. Contractor use of interactive decision-making activities or two-way flows of information (such as co-production or more meaningful delegation of decision-making power) is uncommon. Further, direct-government participation activities tend to include a broader range of citizens (Amirkhanyan and Lambright 2018).

When making changes as a result of citizen engagement, contractors have the option to adjust their pre-existing activities in ways that do not require contract manager approval, adjust activities in ways that require manager approval, or seek larger-scale change that requires a formal contract modification (and many approvals). The greater the degree of change, the larger the number of transaction costs required to achieve it. Contractors will likely seek a balance between addressing citizen input with the least amount of transaction costs. In fact, Amirkhanyan and Lambright (2018)'s work shows us that the larger the change to the activity or contract, the less likely it is to occur. Amirkhanyan and Lambright (2018) identified that participation outcomes influence contractor activities via incremental modifications to activities (most common), the addition of new services (occasional), or formal contract modifications (uncommon). This means that contractors are striving to make adjustments within the confines of their pre-existing contract, limiting the degree of influence citizens can have over activities.

The incentives facing the individuals designing and implementing the participatory activities are also different based on whether they are government or third-party actors. Government actors may choose to engage in participatory activities to increase their legitimacy or credibility, demonstrate their dedication to democratic processes, generate public consensus and support for divisive policy decisions, generate new ideas, improve the effectiveness of their selected policies and projects at the local level, among other factors (Nabatchi and Leighninger 2015; Creighton 2005). On the other hand, contractors' primary incentives are successfully completing their contract obligations. The contract governing the relationship between the two parties typically includes goals to accomplish (with varying degrees of specificity regarding the particular tasks to accomplish that goal), deliverables, expectations and priority areas, conditions for payment, and government regulations that must be adhered to. Contractors will prioritize contract tasks associated with successful completion and payment of the contract and compliance with regulations (to ensure successful contract completion) (Brown and Potoski 2003;

Salamon 1993). Structuring contracts to effectively incentivize participation, therefore, becomes particularly important – as echoed in the existing work in this subfield (LeRoux 2009; Mosely 2012; Amirkhanyan and Lambright 2018).

Including explicit incentives for participation in the contract will increase the likelihood of its implementation significantly. Contract designers may also want to consider including expectations for how contractors incorporate citizen input or how decisions about incorporating input should be made. Government contract managers may want reports on citizen input gathered; they may want to be involved in decisions about how the input should be used; or they may only want to be involved with large, substantive changes. Considering these points in advance will allow for more intentionality in public participation when using contracts.

## Participation and the Contracting Process

So far, we have primarily considered participation activities carried out during contract implementation. However, we can identify additional participation activities that take place during other phases of the government contracting process (see Table 1). In addition to outlining the phases, Table 1 also identifies the goals of participation activities carried out within each phase. Participation tools are selected to achieve particular participation goals.

As discussed above, the intersection of participation and contracting engages additional actors in the policy and participation processes. The goals outlined in Table 1 are furthered by three different types of participants:

- Type one: Third parties engaged by the government (these actors may include target citizens of the policy itself or other relevant third parties such as policy or topical experts).
- Type two: The contractor.
- Type three: Target citizens of the policy engaged by the contractor.

**Public Participation in Procurement, Table 1** Participation goals by contracting phase

| Contracting phases | Goals of participation |
|---|---|
| 1. Contract goals established | Identify goals of the contract based on either public problems and needs or government needs, generate buy-in for the contract goals among impacted groups |
| 2. Contract solicitation designed | Source ideas for specific approaches to tangibly achieving the established contract goals, generate buy-in for the contract goals and activities among impacted groups |
| 3. Contract proposals developed and submitted | Source ideas for specific approaches to tangibly achieving the established contract goals, generate buy-in for contract goals and activities among impacted groups |
| 4. Proposals evaluated and contractor selected | Select a contractor and set of activities to achieve contract goals that reflects the preferences of impacted groups, generate buy-in for the contracting process and contractor selected |
| 5. Contract implemented | Source ideas for *further* specification of contract activities to tangibly achieve contract goals in ways compatible with impacted groups, obtain feedback on how to improve your planned activities given the local context, generate buy-in for the selected activities as you implement them |
| 6. Contract work monitored | Ensure real-time contract completion and quality |
| 7. Contract evaluated (at/after its completion) | Obtain feedback on policy or contractor performance, obtain recommendations for improvement on future contracts |

The government may choose to engage third-party actors directly in participation (type one) surrounding a contract activity. These actors are engaged in two types of activities: determining project goals, priorities, and activities or selecting and overseeing the contractor.

In contract phases 1 (contract goals established) and 2 (contract solicitation designed), the government may solicit input in defining the goals and scope of the contract. Alternatively, they may have broad goals but seek input in the fleshing out more of the specifics of the activity. Third-party actors may be sought out to participate in these activities for two reasons. First, members of the target group may be engaged to define their needs or priorities, which in turn influence the goals of the contract. They may also be engaged to identify locally generated solutions to predetermined problems, which influences the specifics of the contract solicitation. Second, experts of either the target group or the policy area may be engaged during these two phases to leverage existing knowledge and research in defining contract goals and solicitations. Experts may range from academics to recognized leaders in the field, to members of local organizations doing similar work.

Type one participants may also be involved in phases 4 (proposals evaluated and contractor selected), 6 (contract work monitored), and 7 (contract evaluated). In these phases, the participants serve in an evaluative and/or oversight capacity. They may help select the contractor to be hired: target group members ensure selection maximizes local appropriateness and effectiveness, while experts maximize the likelihood of the selected approach succeeding from a technical perspective. They may also monitor implementation to ensure successful completion and high-quality work. In particular, target group members may be engaged to assess day-to-day satisfaction. Experts may be hired to follow along and report back. Finally, after a contract is completed, type one participants may be engaged to evaluate the overall contract work. Target group members may be interviewed or surveyed to help determine overall effectiveness of or satisfaction with the work. Experts may conduct a more formal investigation.

Type two participants may participate in phase 3 (contract proposals developed and submitted). In this phase, a number of prospective contractors (offerors) develop and submit a proposal to win a contract. Contract solicitations vary in the degree to which the offerors must design activities and/or detailed activity tasks. Some contract solicitations require the offeror to fully design the contract activity, while others fully specify activities and tasks. Offerors may therefore have the opportunity to participate in activity design. This activity becomes particularly interesting for participation researchers when offerors are representative of the target group.

Type three participants are engaged during phase 5 (contract implemented). This is the type of participant considered most commonly in the literature and the type discussed in the above sections. The contractor directly engages target group members to help develop activities and details that operationalize the contract's scope of work. This engagement helps tailor contract work to the local level, making it more locally appropriate and effective.

## Conclusion: A Wide Potential for Future Research

Contracted-out public participation is a fascinating, yet under-researched, real-world consequence of new public management and the outsourcing of government work. A limited number of studies highlight that contracts can indeed be used to incentivize participation and that explicitly incentivizing participation activities in the contract is critical to completion of the activities. Contracting participation activities does seem to limit the extent to which citizens can contribute substantively to decision-making. Further, there are additional opportunities for public participation in the government contracting process that tap additional actors in roles not typically considered.

Additional research can also highlight the nature of contracted-out participation. For example, across all government sectors and within each sector, which participation goals are most commonly pursued using contracts and employing which tools? How often does participation occur at each stage of contracting? What is the extent to which contracting-out participation limits the impact of citizen engagement on policy implementation? To what extent are the goals

of participation at each stage in the policy cycle altered by using contracts? Does contracting have different impacts on participation at different levels of government? What sort of impacts of contracting on participation have we not yet identified? Future research along these and similar lines will not only further our academic understanding but will provide contract managers with critical insight to improve their design and oversight of participation activities under contracts.

## Synonyms

Happy aging; Income security; Pension administration; Public concern

## Definitions

| | |
|---|---|
| Administration | It refers to determined action taken in pursuit of a conscious purpose. It is the systematic ordering of affairs and the calculated use of resources in the interest of the governed. |
| Public pension | It is a monthly sum paid by government to a retired public servant after working for a specific period of time, or when he or she is considered too old or ill to work, or having reached the statutory age of retirement. The payment of pension continues until the retiree dies. |

P

| | |
|---|---|
| Retiree | A person who stops working in public service after reaching the statutory age of retirement. |
| Well-being | This is the retiree's ability to meet basic needs and feel a sense of security or satisfaction with their condition of existence. |

## Introduction

The establishment of stable sources of income security throughout old age is critical, and in several countries, the public pension systems are bases on which the minimum basic income security is built. Therefore, the need for the development of well-organized pension schemes and other social security systems is necessary. Retirees in Nigeria suffer a large financial care gap because of the lack of an all-inclusive and suitable social security system. There is substantial evidence that pensions are effective in reducing poverty among retirees and their families. Pensions can also create other positive well-being outcomes, including better health status. Public pensions are important tools for safeguarding retirees' financial security, and besides access to quality health services, this is necessary for their self-worth and well-being. There is a need for the country to develop a well-structured pension system that can guarantee adequate and steady pension payments and provide income security for the retirees.

A pension is an earning payable at a regular interval to someone who retires from a pensionable employment. It is a periodic payment made by government to its retired employee until the death of the employee in consideration of past services rendered to the establishment. Pension is classified as: First, Retiring Pension which is usually granted to a public servant who is permitted to retire after completing a fixed period of quality service usually 30–35 years or on attaining the age of 60–65 years for the public service in Nigeria and 70 years of age for professors and judges; whichever of the two comes first. The second is the Compensatory Pension which is granted to a public servant whose permanent post is abolished and government is unable to provide him with suitable alternative employment. The third is the Superannuating Pension; this type of pension plan is given to a public servant who retires at the prescribed age limit as stated in the condition of service. Lastly, the Compassionate Allowance occurs when a pension scheme is not allowed on account of a public servant's removal from service for misconduct, insolvency or incompetence or inefficiency.

The Primary goal of pension system should be to provide adequate, affordable, sustainable, and robust retirement income while seeking to implement a welfare improving scheme in a manner appropriate to the individual country. An adequate system is one that provides benefit sufficient to prevent old age poverty in addition to providing a reliable means to good life time consumption for retirees. An affordable system is one that is within the financing capacity of individuals and the society and does not unduly displace other social or economic imperatives. A sustainable system is one that is financially sound and can be maintained overtime, that has the capacity to withstand major shocks, including those coming from economic, demographic, and political instability.

## Serving Retirees Interest

The fundamental task of government and its institutions is also to serve the interest of retired public servants (retirees) (Organization for Economic Cooperation and Development [OECD] 2014). This duty transforms a civic ideal into a responsibility for government leaders (Denhardt and Denhardt 2007). Retirees interest has various connotations and seems not to be precise. Authors clarify it in terms of retirement income or anything of interest to the public retirees. It involves the outcomes best serving the long-run survival and well-being of retirees. It is what happens when public servants have retired after discharging their obligations and successfully claim their rights in form of pension. This is achieved when retirees understand that public institutions provide them with quality services of paying their pension as and when due.

Retirement income and well-being of retirees usually receive distinct considerations in the

literature; however, collectively, they have received only a little consideration in developing countries. In many developing countries, the coverage of formal social security pensions is limited and benefits paid are inadequate. The argument in this entry is that social security pensions constitute the main financial source of livelihood for most retired public sector workers. Therefore, securing a decent financial experience in retirement is either constrained or enhanced depending on how much the retirement incomes they receive are. However, their effect on the well-being of retirees has not been adequately explored, particularly in relation to developing countries. Even though there is generally a good body of literature on well-being of populations globally, not much is seen in relation to the relationship between retirement incomes and well-being of retirees in the context of developing countries. Thus, there is need to explore this aspect of development discourse in order to fill that gap in literature. The structure of Nigeria's population is witnessing increases in the population of retirees. As such, there is an urgent need for research that will inform policy and planning for the retirees, particularly in relation to their pension. In view of the fact that the only statutory arrangement for ensuring well-being in retirement in Nigeria is social security pensions, this study will provide a resource for assessing the adequacy of the social security pension scheme in Nigeria and also provide mechanisms for enhancing the well-being of retired public servants. In a developing country like Nigeria where efforts to bring about qualitative change in the lives of the retirees through several pension schemes are faced with numerous challenges, an entry of this nature will be a basis for policy initiatives and provide new knowledge that will initiate further debates on the relationship of pension and well-being.

## History of Pension Administration in Nigeria

The pension system was introduced in Nigeria by the Colonial Administration. The first legislative document on pension in Nigeria was the 1951 Pension Ordinance which has retroactive effect from January 1, 1946. The Ordinance provided public servants with both pension and gratuity (Ahmed 2006). The National Provident Fund (NPF) scheme established in 1961 was the first legislation to address pension matters of private organizations in Nigeria. This was the first social protection scheme for the nonpensionable private sector employees in Nigeria. It was mainly a saving scheme where both employee and employer contributed the sum of N4 each on monthly basis. The scheme provided for only one-off lump sum benefit (Admad 2006). The NPF was followed by Armed Forces Pension Acts No. 103 of 1972 and by the Pension Acts No. 102 of 1979. The Pension Acts No. 102 of 1976 which commenced on April 1, 1974, repealed existing 113 pension laws hitherto in force. Other Pension Acts included: Pension Rights of Judges Act No. 5 of 1985, the Police and other Government Agencies Pension Scheme enacted under Pension Acts No. 75 of 1987, and the Local Government Pension edict which culminated in the creation of the Local Government Staff Pension Board of 1987. In 1993, the National Social Insurance Trust Fund (NSITF) scheme was instituted by Decree No. 73 of 1993 to replace the defunct NPF scheme with effect from 1st July 1994 to cater for employees in private sector of the economy against laws of employing men in old age, invalidity, or death (Balogun 2006). In 1997, parastatals were allowed to have individual pension arrangements for their staff and appoint Boards of Trustees (BOT) to administer their pension plans as specified in the Standard Trust Deed and Rules prepared by the Office of Head of Service of the Federation. Each BOT was free to decide whether to mention an insured scheme or self-administered arrangement. Therefore, the different schemes by government were aimed at serving the interests of retirees.

However, Pension administration has faced a lot of problems in Nigeria over the years. The old Pension Schemes have been unfunded and grossly mismanaged, consequently bringing untold hardship and suffering on retirees. Sadly, retirees went through tough times and rigorous processes before they were eventually paid their pensions

and other retirement benefits. Sometimes, the money was not available for payment; while at other times, the Pension Fund Administrators were not there to meet the retirees' needs. As at June 2004, when the Pension Reform Act (PRA) 2004 was signed into law, outstanding pension liabilities were estimated at ₦2.3 Trillion. Besides the aforementioned, other problems were funding of outstanding pensions and gratuities, merging of service for the purpose of computing retirement benefits, wrong investment decisions, wrong assessment of pension liabilities, arbitrary increases in pension without corresponding funding arrangements, and nonpreservation of benefits; some were mere saving schemes and not pension schemes.

These problems, coupled with administrative bottlenecks, bureaucracies, corrupt practices, inefficiencies of the civil service, have resulted in nonpayment of terminal benefits as and when due. This scenario resulted in accumulation of huge retirement benefits owed to retirees. The overall consequence is that many retired workers died of frustration and lack of funds to maintain their lives, especially in old age when they could no longer engage in any meaningful jobs. Many existing pension administrators could no longer live up to expectation; the hope of many retirees was dashed. There was no adequate safeguard of the funds to guarantee prompt pension and other benefits payments to retirees. In order to address this problem, the Federal Government in 2004, passed a bill to reform the entire system of pension administration in Nigeria.

## Law Governing Pension in Nigeria

The law governing pension administration in Nigeria is the Pension Reform Act (PRA) 2004, as amended in 2014, which created National Pension Commission to provide the ethical framework and regulatory mechanism for pension administration in the country. The PRA, signed into law in June 2004, introduced reforms in the structure of pension administration in Nigeria. The law makes it mandatory for all employees of the Federal Government and workers in the private sector, where the total number of employees is five (5) or more, to join the Contributory Pension Scheme (CPS). The Act required that only licensed Pension Fund Administrators (PFAs) manage Pension Funds, while the Pension Fund assets can only be held by licensed Pension Fund Custodians (PFCs). The PRA of 2004 came into being with a view to reducing the difficulties encountered by retirees in Nigeria under the old pension scheme. It is believed that the new scheme will guarantee prompt payment of pensions to retirees, avoid aged pensioners queuing for hours or days in the sun to collect their pensions, and also increase their standard of living.

Therefore, objectives of the Scheme according to Section 2, Part 1 of the PRA of 2004 include ensuring that every person who worked in either the public service of the federation; Federal Capital Territory or private sector receives his retirement benefits as and when due; assist imprudent individuals by ensuring that they save in order to cater for their livelihood during old age; establish a uniform set of rules, regulations, and standards for the administration; and payment of retirement benefits for the public service of the federation, federal capital territory; stem the growth of outstanding pension liabilities; and secure compliance and promote wider coverage. It is envisaged that the various reform measures put in place, which are clearly spelt out in the objectives of the new PRA of 2004, would be able to remedy the situation by adequately tackling the difficulties in the old scheme by being adequate, affordable, sustainable, and robust (Balogun 2006).

In an attempt to provide a more secure future for millions of Nigerian workers, the Federal Government signed into law the amended Pensions Act. The Act was designed to bring more certainty to the future by ensuring that Nigerian workers have more financial security in retirement. As such, the Pension Reform Act 2014 made provisions to improve efficiency and accountability in pension administration in the polity by placing further emphasis on protecting pension contributions. The Act will see stiffer

penalties intended to serve as deterrent against mismanagement or diversion of pension funds' assets under any guise. Under the new law, operators who mismanage pension funds will be liable, upon conviction, to not less than 10 years' imprisonment or fine of an amount equal to three times the amount so misappropriated, or diverted, or both imprisonment and fine.

Furthermore, there are currently more sophisticated modes of diversion of pension assets, such as diversion and or nondisclosure of interests and commissions accruable to pension fund assets under any guise. The 2014 Act also empowers National Pension Commission to institute criminal proceedings against employers who persistently fail to deduct and/or remit pension contributions of their employees within the stipulated time. This was not provided for by the 2004 Act. Similarly, the new Act creates another condition in which a retiree may be allowed to withdraw from his retirement savings account. An employee who disengages from employment or is disengaged before the age of 50 and is unable to secure employment within 4 months of disengagement is allowed to make withdrawals from the account not exceeding 25% of the total amount credited to the retirement savings account. Also, a Pension Protection Fund has been created under the new Act to include annual subvention of 1% of the total monthly wage bill payable to employees in the public sector, an annual pension protection levy (the percentage of which is to be determined by National Pension Commission) and income from investments of the Pension Protection Fund. The objective of the Fund is to guarantee a minimum benefit to retirees in the event of any shortfalls in the investment of pension funds.

## Conclusion

This entry concludes that the retirement in the Nigerian public sector has little expectation concerning financial benefits as the norm concerning payment of pension entails delays in the payment of pension. These bring about a significant drop in the standard of living of retirees who may not have alternatives plans and do not have reliable families to support them financially, even though the administration of pension in Nigeria has no doubt been enhanced with the passage of the Pension Reform Act 2014. The Act has provided a platform for a more effective, efficient, and transparent administration of pensions in the Public Service, yet the pension paid to retirees is meager and hardly meets their needs at retirement. If Nigeria is able to provide adequately for retired public servants through its pension system, it will not only benefit the individual retirees, but also their families and other dependents.

Therefore, retirees should not be solely dependent on pension after retirement. No matter how effective the strategy adopted in the administration of pension fund is, alternate plans should be made from day one of start of one's working years capable of improving one's finances at retirement. This could include setting aside a ratio of one's salary and investing in long term securities in anticipation of retirement. In addition, government should have the political will to enforce the sanctions/penalties in the 2014 PRA on defaulting employers to enforce compliance with the regulations. Punishments should also be meted out to those who steal pension funds so as to prevent others who may have the intention. Finally, the institutions that are charged with pension administration, such as National Pension Commission, should be strengthened by quality legislation to stream line the documentations, eliminate unnecessary bottlenecks in processing pensioners' entitlements, engage pension funds in viable investments to ensure prompt and regular payments to the retirees so as to guarantee their well-being, while stiffer penalty is meted on any institution of government that fails to comply with the provisions of the Act.
